What is more important of course is the precedent that has been established in this matter. This immediate fall-out could be seen in surrounding areas where workers employed at several employment works started getting the legal minimum wage.

At the time of writing the one year struggle for the realisation of minimum wage, which was preceded by a successful land struggle, appears to be in high spirits. But some forces are not at all happy with this turn of events and appear to be planning repression.

MKSS is a non party political organisation of the weaker sections which has been fighting for the issues of weaker sections mainly by mobilising their own strength but also by drawing in sympathetic officials, academicians, journalists and social workers in other parts of the state. Although the MKSS has had its share of frustrations, on the whole this broad mobilisation has worked quite well during the last two years. A few members of MKSS support themselves by low budget, relevant research for the government.

[A young and brilliant academician Deepak Chanchandani who worked at the Institute of Development Studies in Jaipur went out his way to be of great help to the MKSS. Deepak died recently in a tragic accident at Jaipur. MKSS activists wish to record their great appreciation of the solidarity he showed the MKSS ever since he came in contact with them.]

Rajasthan's Sorrow

Report of Workshop on Indira Gandhi Canal

S Ramanathan

The sustainability of India's largest irrigation project meant to provide irrigation and drinking water to five districts of the Rajasthan is under debate. The project has so far brought only negative change to the poor of the region.

THE Indira Gandhi Nahar Pariyojana (IGNP), with a command area of 1.5 million hectares (m ha), is the largest irrigation project to date in the country, and is meant to provide irrigation and drinking water to five districts in north west Rajasthan. The project was conceived in 1948, and was approved by the Planning Commission of India in 1957 at an estimate of Rs 66.43 crore. The project is being carried out in two stages, and after an expenditure of Rs 720 crore, one-third of the command, or stage I of the project, is being utilised. Stage II of the command is just now being settled.

But, the very sustainability of the project is now an issue. With the introduction of irrigation the ground water table in the command has been rising at the rate of one metre per year, and this has been the highest among all canal commands. It is estimated that already 34 per cent of the stage I command has been affected by waterlogging and salinity ('Ecological and Environmental Studies for Integrated Development of Indira Gandhi Nahar Project, Stage II', Draft Report, WAPCOS, 1989). In stage II, approximately 35 per cent of the gross command has a hard pan or barrier layers at depths ranging from five to 10 metres below ground level (bgl). It is said that in these regions the water table will rise up to six metres (the critical limit) in a span of four to six years after the advent of irrigation ('Canal Irrigation in Arid Zone of Rajasthan and Its Ecological Implications' by Chatterji et al, in *Desert Ecology* edited by Ishwar Prakash, 1988). There are cases of fields and even an entire village having been abandoned due to waterlogging.

In order to create an awareness about these aspects among the public, and also to arrive at some solutions to the problems faced in stage I, and evolve alternate strategies for stage II, the Uttar Rajasthan Milk Union (URMU) Trust organised a two day workshop on the canal in Lunkaransar (near Bikaner) in February. The participants were villagers, journalists, government officials, academics, and funding agencies. Though some background papers on the environment, status of women and children, etc., were

circulated before the workshop began, these were not presented. First the villagers presented their cases, while other participants were expected to listen and then offer suggestions/solutions. The workshop was divided into four sessions. The first session was on the problem of settlement, the second on the status of women and children, the third on the problems of waterlogging and salinity, and the fourth session was on 'nahar pan chayal' as an alternate institutional mechanism.

To understand the issues raised in the first session, some details are in order. Prior to the canal the area was sparsely populated, with an average density of five persons per sq km. Hence, people had to be brought from outside for utilisation of

the potential. The land colonisation policy in the command began with the Rajasthan Colonisation Act of 1954. Under this act, plots measuring 25.28 bighas (plot size of 6.32 ha each called a 'murabba') of land were to be allotted to bona fide landless persons with a 30 per cent reservation for the scheduled castes and tribes. The priority in allocation was based on the criteria of closest proximity to the location of allotted field. Apart from the landless, certain other categories of people were also eligible for allotment of land in the command. But, the special allotment of land by sale or auction to people who had been domiciled in Rajasthan for about 10 years was begun in the year 1988-89. As of now 50 per cent of the land in the command is set apart for special allotment.

In the first session, two main issues emerged: (a) tardy implementation of the settlement policy, and (b) the correctness of the settlement policy. Villagers recounted tales of land being allotted but not given possession by the 'patwaris' unless bribed, numerous cases of double allotment where any one who could bribe got the land, allotted lands taken away on some pretext but no compensation offered, and cases where land either had no water courses or was on a large sand dune,

OUTSTANDING BOOKS

INTERNATIONAL BANKING

P R Bhat

Examines various factors that led to serious debt problems in 1980s for some developing countries like Latin American countries which misutilised the credit received from international commercial banks in 1970s.

higher than the gravity-drawn water could reach. Villagers questioned the policy of special allotment when the original intention was to allot land to the landless; they also questioned the policy of settling people from different areas and back-grounds together in one 'abadi'.

The official response was that the government was aware of the corruption and the non-cooperative attitude of the 'patwaris'. Hence, it had been organising settlement motivation camps, which are to be the single window for redressal of all problems of settlement—though only allottees in whose lands water courses have been constructed were invited to these camps. On the issue of special allotment of land it was pointed out that since the rate of settlement by the landless had been very poor it had been decided to give away lands on special allotment for effective utilisation of the created potential. But the villagers argued that special allotment has led to land speculation, absentee landlordism, and increased incidence of share-cropping. Villagers protested that even common property assets such as cremation grounds were being allotted.

STATUS OF WOMEN

While in the first session the focus was on the poor not getting land, the second session on the status of women and children revealed the misery of those who had acquired land. While allottees affirmed that income had increased, many spoke of deteriorating health conditions of children, increased water-borne diseases, increased drudgery for women in collecting drinking water, fodder and fuel, sharpening of gender inequity, and increase in the consumption of liquor. Women said the increased wealth was only 'on paper', for the crop income was only enough to finance their debts and not enough to sustain their households.

In one background note, the results of a comparative analysis of the health status of 480 children below five years in irrigated and unirrigated areas (carried out by URMUL Trust), showed that while there was "... no significant difference between children in unirrigated and irrigated areas overall, there is a significant [i.e., 10 per cent] difference between the female children in irrigated and unirrigated areas, showing the *status of female children in the irrigated areas to be worse than that of their sisters in the neighbouring uncommand villages*" (emphasis in original). One tentative hypothesis relates this to the shift in cropping pattern from traditional cereal crops—bajra, moth, guvar—to non-traditional cash crops like groundnut and mustard. Though groundnut and mustard are excellent sources of protein they are

not consumed locally but are sold to service debts incurred on land purchase, levelling, etc.

A second hypothesis associates the phenomenon to the increased work-load on the women in the irrigated areas. After the introduction of the canal, a study found that for women in particular there has been a sharper increase in the work-load. This was attributed to the fact that much of what is traditionally 'men's work' like ploughing and levelling have been mechanised, and not so in the case of women's work like weeding and harvesting. In addition, women's work tends to be distributed throughout the year whereas that of men is usually a one-time activity, with long slack periods between ('Development of Women in IGNP; Situational Analysis and Action Plan', IDS, 1989).

The village women who were present more or less corroborated the above hypotheses, and also pointed to the absence of health, education and market facilities, cremation grounds, etc. But, they complained most emphatically about the sense of isolation in living in 'dhanis' (irrigated fields). In fact, a survey in 1980-81 found that 76 per cent of the respondents resided in their fields, only 18 per cent in the 'abadis' and 6 per cent elsewhere (*Economic Viability and Land-Use Survey, Stage I, Phase II, Special Report I, 1980-81*). The reason being that the average size of the residential settlement unit (abadi) varied between four to six 'chaks'. Due to the sparse locations of the commanded area pockets, interspersed by sand dunes and depressions, the settlers found that their agricultural holdings were quite far from the settlement colonies. Hence, they had little choice but to settle individually on their own farm premises and the earmarked colonies were sparsely populated. One of the background papers highlighted this aspect and raised the need to examine the settlement policy in detail.

It was suggested to IGNP officials that they should provide mobile medical facilities, hand pumps to ease the drudgery for women, and proper educational facilities with the school master being from the same village. In fact, some villagers suggested that education should be made compulsory, especially for women. It was also suggested that more 'mahila kendras' should be built and women should be made to visit them as often as possible. Villagers also suggested that as far as possible villagers from the same area/village should be settled in a 'chak' to provide a continuum in social relations. Some thought was also given to evolving alternate cropping strategies to satisfy local fuel requirements which have

been exacerbated by canal-irrigation cropping patterns.

The third session on salinity and waterlogging was preceded by a visit to some of the highly waterlogged and saline fields near Lunkaransar. Ironically, the government agricultural research farm nearby had the most highly saline and waterlogged fields. One farmer highlighted how of the 25 bighas of land allotted to him, 14 bighas were destroyed by salinity: he predicted his remaining land would become uncultivable in a few years. He pointed out that with the reduction in acreage he was unable to pay off the loan contracted for land purchase and levelling and hence had to go in for an alternate employment. But, the question then raised was what about others who do not have the requisite qualification for alternate employment and whose sole possession was the land. Many complained that their debts were larger than the value of their degraded lands. Another issue raised was, who was responsible for this state of affairs?

IGNP officials contended that the farmers had been over-irrigating their lands and that no one prevented them from cultivating less water-consumptive traditional crops. But, the officials ignored the farmers' pleas about huge loans taken for the purchase of land, levelling and capital inputs. Only commercial crops like groundnut, wheat and cotton could help to pay them off. Also the interaction of the eight-day rotational schedule within canals and the seven-day 'warabandi' schedule in the 'chaks' makes water access uncertain. The risk becomes too great to pass up water on the occasion it flows by their fields. Also according to one estimate in stage I area only 40 per cent of the land was economically irrigable, and economically non-irrigable land forms about 47 per cent. Was it not the duty of the officials to adequately warn the farmers of the land's limitations and the dangers of irrigation.

One of the causes for the waterlogging in stage I is the irresponsible use of 18 Ghaggar depressions in the absence of natural subsurface drainage and impermeable formations at shallow depths. These are a series of 18 natural reservoirs bounded by earthen or sand embankments and used to store the flood flows of river Ghaggar to prevent their entry into Pakistan. An official at the workshop conceded that this practice was a mistake. There was no drainage component built into the stage I of the project due to its huge financial cost.

Officials described measures taken to combat waterlogging and salinity, such as the drainage project involving the three states of Punjab, Haryana and Rajasthan.

The Tawa dam crisis in Madhya Pradesh was presented by one participant to show the enormous cost involved in reclaiming the waterlogged land. Officials were asked what they proposed to do with the villagers who lost their lands to waterlogging. They felt that alternate land could be given—an unimaginable option in the light of the high numbers of affected families.

The discussion then focused on future options to prevent degradation of stage II, where the environment is very fragile. Animal husbandry was discussed as an alternate, more sustainable occupation—ironically this was the dominant occupation prior to the canal. The problem is that it is now economically unfeasible. Hence, it was suggested that the government should think in terms of providing subsidies/support prices and adequate infrastructure to make livestock rearing a profitable and sustainable proposition.

The other measures suggested were the use of drip and sprinkler irrigation techniques, which would be impossible for a small farmer to adopt unless subsidised. It was also suggested that the government should give up its insistence on using the project for intensive agriculture and use it to provide drinking water to the arid districts of Rajasthan. As of now only 11.5 per cent is earmarked for both drinking and industrial use. One wonders how much water will be diverted towards industry and away from households once industry begins to develop.

The focus of the last session was on how to increase the participation by the users, for better management of the canal and the environment. A case study of some of the 'chak samitis', presented in a background paper, showed that the present 'samitis' have hardly any power to either oversee the construction of the distribution networks or their maintenance. Two suggestions came up here. One from the official side was that the canal board would sell the water to the community who would then manage its distribution. This was not received very well by the villagers, who were not keen to be involved in water distribution without involvement in the construction of the distribution channels, since they may be burdened with sub-standard channels. The other suggestion was that a *nahar panchayat* which managed more affairs than just water distribution should be developed which would have the responsibility of working out a crop-mix or, a mix of crop and livestock, manage water distribution and thus avoid problems of waterlogging, maintain the distribution systems and manage the infrastructure required for livestock management. It was felt that this would

be ideal, but to achieve this the panchayat has to be given adequate powers. Hence, the question was, to what extent is the government willing to provide powers and involve the users in the management of the canal? Many of the villagers voiced dis-

approval of the 'nahar panchayat' proposal. Why should this be any different from other decision-making bodies which have no power? As it is, the canal has left many of them more powerless than ever before.

Urban Building: System Constraints in Calcutta

Sreemay Basu

While the Calcutta Municipal Corporation, both in its formal statutory functioning and even more in the extra-legal use and abuse of authority, has been instrumental in reducing the design and construction of buildings to the level of the 'commodities' trade carried on in the city, two other factors—land use policy and the conduct of professionals associated with the building industry—also deserve critical scrutiny.

JULY 1, declared by the Paris-based International Union of Architects as World Architects' Day, was celebrated jointly by the Calcutta Centre of the Indian Institute of Architects and the United States Information Centre. The new building of the US Information Centre on Chowringhee has been completed just some months ago after long delays, strikes, litigation and even demolition (of the guard house). Calcutta architects, invited to tour the building, were able via telephone, to talk to the designers in the US. In the discussions, a fleeting, elusive reflection of the state of the profession in Calcutta was discernible to those who cared to listen carefully to what was said and, perhaps even more so, to what was left unsaid.

Conditions taken for granted in daily transactions seem to acquire a different hue when seen through alien eyes. Is it, perhaps, because residual self respect forces the discarding of standards which are indifferent, and the confrontation of standards that are less so? With blinkers removed, it seems timely to take a long look at the state of the building profession in Calcutta.

The Calcutta Centre of the Indian Institute of Architects is itself newly formed. It has had a controversial birth because there already exists a West Bengal Chapter of the Institute. The formation of the Calcutta Centre is stated to be in response to the felt need for a professional forum to address the specific and peculiar problems of architectural practice in the city. Practising architects allege that these problems arise mainly because, over the years, the Calcutta Municipal Corporation (CMC) has, both in its formal statutory functioning and, even more so, in the extra-legal use and misuse of vested

authority by groups and individuals among its staff, been instrumental in reducing the profession of design and construction of buildings to the levels of the 'commodities' trade prevalent in the city.

Many cite as the manifestation of this degeneration the deliberate obfuscation of CMC sanctioning procedures to the point where, according to recent observations, a plan for a building less than 13.5 m in height has to be checked 64 times (often several times by the same CMC staff) before sanction is granted. For buildings requiring committee approvals, the number of checks is even higher. The ability to obtain sanctions from the CMC (and subsequent expertise in keeping inspectors satisfied during the construction phase) is said to rank as the most important attribute of a practising architect or IBS (licensed building surveyor) in the city. Architects and engineers complain that a prospective builder, irrespective of whether he is a promoter of large complexes or an owner of an individual building, is harried by the existing process to the point where he can have no residual energy or regard for the niceties of design (either architectural or structural) or for the construction.

The amount of lubrication that is said to ease the way through this labyrinth of 64 corners varied between Rs 1.50 and Rs 2.00 per sqft prior to the recent embargo on plan submissions. Further sums were deemed necessary to see things through committee and the construction period and, ultimately, to obtain the completion certificate. The potency of lubrication can hardly be confined to ensuring that only sanctionable and soundly designed buildings obtain necessary approvals. Inevitably, it clears the path for

the non-sanctionable and the not-soundly designed buildings to be also approved and constructed. This, according to popular perception, is the main cause behind the spate of unauthorised construction and of building collapses plaguing Calcutta recently.

But is it fair to blame the CMC alone? In the extensive bustee areas (slums), where some collapses have taken place, the CMC's writ fails to penetrate the muscle and politics nexus. In the other areas of the city, it is inevitable perhaps that, when the construction of buildings is as tightly regulated as it is, the lion's share of the blame goes to the regulating agency. However, two other factors, land use policy and the conduct of professionals associated with the building industry also deserve careful scrutiny.

Why were non professionals attracted to the building industry in the first place? Perhaps because scarcity of accommodation raised prices to levels where building promotion proved more lucrative than other avenues of making quick money? The CMC can hardly be saddled with the responsibility for this endemic scarcity. The lack of infrastructure, particularly communication, the lack of land use plans or, more accurately, the lack of a planning and implementation process with the requisite authority, even the lack of a coherent realistic development policy despite the early efforts of the Ford Foundation and the existence of a Land Use Board, the State Planning Board, CMPD (Calcutta Metropolitan Planning Organisation), ICPO (Town and Country Planning Organisation), Housing Board, MDA (Calcutta Metropolitan Development Authority), HUDCO (Housing and Urban Development Corporation), IDFC (Housing Development Finance Corporation) and, recently, the State Bank subsidiary, HPIIC (Housing Promotion Finance Corporation), and the National Housing Bank, are at the root of the problem. The bogey of course, is lack of resources. It has been raised long and logged hard, but still fails to obscure the act of abysmal squandering of available resources on *ad hoc* schemes too often subverted to serve political and personal ends. The immediate scope of the present article does not include policy analysis, but it should not be lost sight of that the resources created by housing shortage have rigns beyond the CMC and that a beginning is *still* to be made to address the fundamental causes with sincerity and technical competence.

The Town and Country Planning Act of 1979 stipulated the early formulation of a development plan. Twelve years later, in 1991, there exists only an 'Outline Development Plan' which is, at best, of

dubious clarity. It is incomprehensible how planning exercises of such vital importance, mandated through enactment, can be conducted in the absence of complete sets of basic land use surveys and data on sewerage, water supply, gas, electricity, telephone and other services in existence. Modern day land use planning is a highly complex multidisciplinary, systemic task involving economists, geographers, environmentalists, demographers, physical planners, transportation engineers, regional scientists, sociologists, and specialists in computer aided modelling and simulation. It requires the careful and tedious building of complex data-bases necessary for the formulation and testing of proposed interventions in the existing systems. And, of course, it requires political commitment for implementation.

While individuals within the CMC were being subjected to economic (and political) pressure to further private interests, the IBS and IBA (licensed building architects) associations could have aligned themselves with the CMC staff to offer resistance. In fact, the code of conduct professionals are supposed to adhere to would require them to have done so. Why did this not happen? It would be well worth the while of professionals to do some soul searching. They might inevitably have to confront the unpleasant fact that deterioration of standards have hit home just as badly. There is no organisation, no cohesive front, no motivation to fight for and uphold principles for the common good. The professionals have abrogated their responsibility to such an extent that they now find themselves in the unenviable position of being squeezed by the promoters and talked down to by even unqualified CMC staff. The promoters have reduced professionals to the level of artisans. Buildings in Calcutta are now designed on 'square foot' rates rather than the percentage basis specified by both the Indian Institute of Architects and the Council of Architecture. These rates, moreover, are pegged so low as to be absurd. Consequently the professionals too have begun to disregard the niceties of design, construction, and professional ethics, accepting commissions from builders and suppliers to achieve economic viability. The debilitating dog eat dog world of unaccounted for cash based commerce now pervades the profession as well. Those who are not guilty of commission directly have in many instances to plead guilty to acts of omission. Most necessarily have to act as or provide conduits for lubricants to flow to the CMC friction points.

This state of affairs is by no means confined to Calcutta alone. It is representative

of the general malaise that afflicts the profession to a lesser or larger extent throughout India. It would obviously be absurd to suggest adherence to professional standards that are unrealistic in the general environment of sliding societal norms. However, there are levels below which these standards must not be allowed to fall. Else, the *raison d'être* of a profession simply disappears. It is for professionals themselves to define this level and uphold it with due determination. The 'good' of society (in the form of the poor flat owners) also depends on this.

The only positive aspect of the collapses and the deaths of so many innocent (and inevitably poor) people is that the government has been forced to take more than a perfunctory look at the whole building delivery process. After the initial *ad hoc* ordinance barring buildings of over 13.5 m in height following the Bhowanipur collapse and the banning of construction on filled up sites after the Behala collapse, a more systematic approach is being adopted to rationalise the 1990 Building Rules of the CMC which came into force on December 12 last year. Next on the cards is said to be reforms to make the statutory authority more accountable. This is bound to create resistance. The implementation of the provisions of the Architects Act of 1972 was successfully stalled till 1991. There is no quick fix. Meanwhile, the professionals have to identify and fight the pressures that will inevitably doom their livelihood. Perhaps the Calcutta Centre will form the nucleus of the revival of professionalism in the building industry in Calcutta. The long suffering public is certainly owed this much.

End of Gorbachev Era?

Ramnath Narayanswamy

What Gorbachev is attempting to do now—to secure and save the centre by presidential decree—is not promising. The way back to a stronger Moscow lies in genuine decentralisation in an increasingly European context, says Hans Hermann Hohmann, specialist in Soviet and East European affairs.

Ramnath Narayanswamy: The campaign for perestroika triggered by Gorbachev appears to be impelling its architect to pull up the barriers against the very restructuring that he initially set out to accomplish. By his inability to put himself firmly on the side of the reformers, Gorbachev appears to have lost a valuable opportunity. Are we therefore in the process of witnessing the end of the Gorbachev era?

Hans Hohmann: Of course, we will first have to define what the Gorbachev era was or is. The Gorbachev era was the attempt to modify the old system by introducing changes at various levels of economic and political life. His initial objective did not lie in abolishing socialism—the Leninist legitimisation of socialism—in the Soviet Union. Neither did he intend to abolish the one-party system. His idea consisted in having a perestroika in the sense of a process directed from above and not a process leading to revolution from below. Viewed in this specific sense, perestroika has failed and is failing if we conceive the Gorbachev era as the era of a man who has tried to modernise the system and not abolish it: this era is over. This does not necessarily mean that Gorbachev himself is a spent force, but I think he can only survive as a radical reformer: his chances of survival are largely dependent on his ability to join hands with genuine democratic forces and to move—conceptually and politically—much further than he has until the present.

RN: A cursory appreciation of the Ryzhkov plan and the Shatalin plan suggests that the critical issue for Gorbachev lies in the distribution of economic and political power. How do you assess the strengths and weaknesses of the Ryzhkov and Shatalin plans? Is a compromise between the two plans, a desirable/feasible objective under current Soviet conditions?

HH: There are a number of differences between the two plans. However, more important than these differences in the content of the two plans is the difference of the political context. Of course, it is possible to have a compromise between the Ryzhkov plan and the Shatalin plan in the sense that you can have a longer time horizon: Shatalin is very short (500 days) and that was indeed the original idea of

the Yeltsin reform in the RSFSR. This is certainly too short a period to reform an economy. The essence of the 500-day programme does not lie so much in the unrealistic expectation that a reform could be pursued in 500 days; the idea rather lies in emitting a strong signal to the public. The long-term horizon of the Ryzhkov plan is uninteresting to an impatient public and is therefore viewed as a disappointment. Of course, a compromise is possible but the political context is however more important in my view. If a compromise means more authority being vested in the centre at Moscow and frustrating the aspirations of the republics, not to speak of preserving the old apparatus (Ryzhkov is of course a symbol of the old apparatus), then the compromise will certainly not work, not because of economic imperatives which indeed exist (you can to a certain degree combine the two plans on condition of course that Ryzhkov goes in the direction of the market), but because of the political context. Herein lies the difference. It must be disappointing for the reformers and for the republics if a compromise entails the continuation of Ryzhkov as prime minister and the preservation of the old apparatus. Many reformers are agreeable to use the Gorbachev compromise as a beginning; the problem is what is done with the compromise and whether Ryzhkov is the right man to lead this compromise to a process of stabilisation and an eventual breakthrough to the market. I therefore believe that economic reform currently has certain political preconditions or to put the matter differently, the politics of economic reform is today more important than the economics of political reform. Gorbachev himself must also learn to move conceptually towards the republics—he can then perhaps hope that on the basis of a reformed system, some rights are given back to the centre.

RN: There are good reasons to believe that Gorbachev bears much of the responsibility for the current crisis. These include his initial emphasis on the machine tools industry, the creation of Gospriemka (State Committee for Quality Acceptance) and the Gosagroprom (State Committee for Agriculture) which contradicted his pro-

fessed objective of decentralisation of decision-making, his contradictory policies towards private and co-operative trade, increasing imports of machinery and cutting the imports of consumer goods, the campaign against alcoholism which heightened the fiscal crisis by reducing budgetary revenues and the massive increase in the budget deficit (from 18 million roubles in 1985 to 100-120 billion roubles in 1989) under which enterprise managers were given the powers to set wages as a result of which they came under increasing pressure to raise wages, and the law on joint ventures which frustrated the entire effort. In retrospect, were these plain and simple errors stemming from a personality who has been brought up in the tradition of the nomenklatura or was the design itself faulty?

HH: I think it is a combination of factors. Among several factors, it can certainly be said that Gorbachev and the Gorbachev era in general underestimated the severity of the crisis. They genuinely believed that it would be possible to remedy economic problems and repair the system by adopting an approach very similar to the one adopted by Yuri Andropov in the early 1980s which consisted in changing economic priorities, imposing more discipline and improving the operation of the planned economy. The earlier plan recognised for example that the capital stock was obsolete and the economy had to be modernised (which resulted in the investment campaign) through reinvestment, etc. This diagnosis proved wrong in the light of the deep crisis afflicting the economy. It was also not possible to secure the approval of the population for improving motivation. The notion of pursuing old targets (such as in heavy industry) alongside some modernisation would have failed in the light of the general frustration of the population. Considering the latter, it would have been advisable to give agriculture and consumer goods production priority. The next problem I think lies in the fact that Gorbachev underestimated the destructive influence of changes in the political domain. The initial idea lay in combining elements of traditional economic policy with changes in the political domain. For example, a glasnost in the early phases of perestroika was intended to be a means to fight against bureaucratic resistance against modernisation. But the problem was that glasnost could not be used as an instrument: it became a new political reality. It became a catalyst of far-reaching political change. Soon the focus on political change and the demands of the population took precedence which explains why many intellectuals believed that

all the early campaigns of the Gorbachev period were doomed to result in failure. In terms of economic reform the half-hearted reform of 1987 (wrongly portrayed as a radical reform), was an attempt to combine the market in the fields of consumer goods production with planning in heavy industry which led to all these disruptions. The partially enlarged rights of the enterprises for example, destroyed financial stability. I would therefore say that these three elements came together and were responsible for these disastrous results. Of course, there are other factors such as the deterioration of terms of trade, the Chernobyl disaster, the Armenian earthquake and so on. There were a number of such exogenous factors. Gorbachev also had a lot of bad luck too. Essentially however I think it was the three-fold mistake of beginning with technocratic modernisation and the underlying idea that it was possible to combine the latter with partial political reform. I think one of Gorbachev's biggest mistakes lay in his (false) perception that glasnost could be used as an instrument of manipulation which could be controlled by the centre. He also underestimated the danger from the standpoint of the system that glasnost could change everything. The third mistake was economic: the half-baked economic measures which were inconsistent.

RN: The reform experiences of the centrally planned economies suggests that it is advisable to first reform agriculture before attempting to reform industry. Do you think Gorbachev ought to have first concentrated on revamping the agricultural sector and improving the supply of consumer goods before attempting to reform the political structure and heavy industry?

HH: I think the major mistake was to simultaneously retain the Soviet Union as a successful world power and transform it into a civil society aimed at providing consumer goods for the public. This was the mistake and this influenced the reform of 1987 which embodied a hybrid mixture of plan and market. This illustrated the attempt to use the economic system as an instrument for political targets. The targets had moreover not changed. I think the Soviet Union has now learnt the lesson that it can no longer be a competing world power, that it must be content with remaining second and that there is a better chance of gaining international influence by not competing with the United States at least as a superpower. The way is now open for a change towards a civil society with other consumer-oriented priorities, but this was not the case in the first years of the Gorbachev era.

RN: The failure of the Supreme Soviet to arrive at a consensus on choosing between

the two plans to steer the country out of its difficulties has led to Gorbachev being armed with greater powers to dictate the future economic course. None of the republics are likely to respect executive decrees from an impotent centre. Does Gorbachev have any feasible options left?

HH: The option for Gorbachev in my view lies in his joining hands with the radical reformers and to join the separatist movements from the republics. Even if this happens, there will still be a number of problems, but I think what is necessary at the moment if economic success is to be achieved, is a national consensus. Economic policy has to be based on a national consensus. There are in my view, three aspects of this consensus. The first is a consensus between Gorbachev and the Soviet population. This implies a necessity for the population to recognise that Gorbachev is a reformer and that this is in their interests. And I think this can only be done through more decisive steps in the direction of a market economy. The second kind of consensus involves one between Gorbachev and the political forces of tomorrow and not of the past. The new political configurations and reformist intellectuals who are gaining increasing influence will be the determining factors in future political life in the Soviet Union. Such a consensus existed before and has since eroded and it is imperative that Gorbachev re-establish it. Gorbachev is still an important force, he still remains a worldwide symbol of reformism and therefore it is not only important for Gorbachev to seek a compromise with the reformers, it is equally important for the reformers themselves. Gorbachev enjoys a good international reputation and this should prove to be a viable basis for co-operation. The third kind of consensus I referred to is of course the consensus between the all-union government and the republics. And I think this is the only chance for Gorbachev to achieve this consensus: he must begin to go in the direction of genuine reform in terms of a clear market programme, institutionalising democracy which is a little mixed at the moment, (there are parties but there are no decrees and laws on the electoral system), and guarantee the republics their sovereignty. If he does this, the exigencies of economic development will or is likely to persuade the republics that it is in their interest to stay together and have central institutions for economic policy, stability, social policies, macro-economic stability and so on. This is the most promising option for Gorbachev.

RN: In other words, he has to rewrite the national contract?

HH: Yes. Even the Baltic states have no chance of survival outside or without

Russia: they need the Russian market to buy and sell. Of course, they will be independent within some kind of loose confederation in the sense of a common market. I think the first step in this direction lies in establishing the consensus I spoke about. What Gorbachev is attempting to do now—to secure and save the centre by presidential decrees—is not a promising way. This may sound paradoxical but the way back to a stronger Moscow lies in genuine decentralisation. And it will be a good idea to achieve this in an increasingly European context or perspective.

RN: It seems to me that the crucial test in the reform initiatives will be the reforms in ownership. Gorbachev's position on the crucial issue of ownership remains ambivalent. What do you think are going to be the likely consequences of this intransigence?

HH: Well, it is absolutely necessary to have a clear conception of privatisation. The problem is that Gorbachev still believes in what he calls the 'social choice' and this limits to a certain degree, property reforms. There has to be a learning process: it must for example be understood that exploitation is not combined with a certain type of property such as private or state property but that exploitation is more a question of the overall social policy which the state pursues. This means that in re-learning social situations in their dependencies, he has to indeed overcome this imbalance. There is a strong dislike for private property and Gorbachev often argues that the population does not like it and so on. But this is a mechanical understanding of property in the Marxian sense. Far more important is the overall economic and political context. If you consider some of the western economies like the Swedish or German economy, there is no exploitation in the sense of workers being exploited by capitalists. There is an overall social framework, (this is what a socially-oriented economy means), that acts as a preventive mechanism. Our experience also teaches us that it is not a good idea to allow the state to intervene directly in the economic sphere: this is a lesson which not everybody has learnt to the requisite extent. But apart from such major questions, there are many practical questions because it is extremely difficult to find an effective private property structure. In the Soviet Union, (where it is not a question of finding former owners because they do not exist), the problem lies in finding owners who are really interested in the firm. At the moment, nobody really knows what the firm is actually worth because of the distorted price system. There are no markets useful to firms. As

a result, it is very difficult to have shares or a market for them. The Soviet press is replete with suggestions of selling enterprises which are on the verge of bankruptcy. But nobody is likely to be interested in such enterprises. A different conception is therefore needed: enterprises which have functioned reasonably well under conditions of planned socialist economy must be sold because these can be expected to perform even better under a market environment

RN: The information explosion ushered in as a result of glasnost prompted a number of Soviet economists to criticise not only their own statistics but even those issued by the CIA as being guilty of overestimating Soviet economic growth in the past. A number of western specialists also appear to have overestimated Soviet economic performance. Has this overestimation been so excessive as to present a distorted image of Soviet economic performance?

HH: I think that it is quite clear that performance in terms of growth portrayed in official statistics overestimated real growth and real growth was also not so high and not so impressive. Whether the CIA was right or not is a very tricky question. I personally have not worked on this question. It could be because the Americans had a political interest to show that the Soviet economy was not effective or competitive, but on the other hand, they were interested in showing the Soviet Union as a dangerous competitor. While there was one bias towards overestimating Soviet economic performance, there was equally another bias towards underestimating Soviet economic claims. At the moment however, I do not think anybody is in a position to say what was right and what was not right. Of course, there is a certain feeling among specialists that not only were the official figures of growth performance overstated, but some other observers as Igor Birman are today being proved right and are being praised for being right. I think it is important to situate these issues in the context of what they mean for the Soviet Union. If the Soviet Union really had much less growth, this indeed could indicate much more stability in terms of them being poorer and they were stable for at least for a certain period. On the other hand, investment figures were not as high as the Soviet Union portrayed them to be. The degree of obsolescence of capital stock was much higher as has been proved by the subsequent breakdown of pipelines and gaslines. In my view therefore, the official figures of the Soviet Union were too high. If the CIA was right in estimating the overall Soviet defence expenditure (which

has not been seriously disputed), and wrong in assessing growth figures, then the share of the military must be much higher. This means that the task of not only privatising the Soviet economy in terms of ownership but also of extending the civilian sector of the economy through a reduction of military production. This also means that the influence of the

military on the economy is much higher than we thought it to be and will therefore be a very serious problem for Gorbachev. This is also one of the main reasons why the reformers are unhappy with Gorbachev: his support to Ryzhkov, who is representative of the old system and is supported by the military-industrial complex appears to confirm their worst

NATIONAL INSTITUTE OF RURAL DEVELOPMENT

Rajendranagar, Hyderabad 500 030

(An Autonomous Institution under
the Government of India)

NIRD is looking for positioning a well experienced person as DIRECTOR, CENTRE ON PANCHAYATI RAJ in the Institute. The Director will be responsible for undertaking independently training and research activities in the field of rural development with reference to activities related to the CENTRE. The broad areas falling under the purview of the Centre are Panchayati Raj and Development Administration with a wide thematic span facilitative of deeper insights into the politico-administrative forms and processes associated with Institution Building for Rural Development in a decentralised development model.

The Director of the CENTRE is expected to provide high level academic leadership in the CENTRE and across faculties. We are looking for a suitable person both from the academic and administrative streams. **Persons with field level experience will be preferred.** Cases of those from the academic stream (Universities, research organisations) and the administrative stream (Senior officers in the State and Central Governments) willing to join the NIRD on deputation terms for a fixed tenure of not less than 2 years will also be considered.

The candidates for the post should have a Master's Degree with first or high second class and Ph.D. in any social sciences with 10 years' experience in research and training and of handling large scale research projects. The published books/papers will also form part of the essential qualifications. The candidate may also enclose a copy each of his best publication. The scale of pay is Rs. 4500-1505700-2007300 plus usual allowances admissible to the Central Government officers. The candidate may have to stay on the campus if offered appropriate level of accommodation.

Interested applicants may seek full details and application forms from the Registrar, NIRD on payment of postal order of Rs. 10. The filled in applications should reach the Registrar, NIRD by 6.9.91.

A.P.J.R.

suspicious.

RN: Positive changes have taken place during the Gorbachev era. While Gorbachev certainly deserves credit for what he has been able to accomplish so far, the most glaring disappointment of his legacy lies in the economic domain. Do the non-economic successes of the Gorbachev era outweigh the failures on the economic front?

HH: It depends on the standpoint from which you pose the question. From the German viewpoint, the changes in foreign policy were certainly good for us and they indeed outweigh the economic failures of the Gorbachev era. The profound changes in eastern Europe and the Soviet Union were a vital precondition for German unification. Even from the standpoint of the Soviet Union, the change is better: the economic problems and losses will be overcome in the long-run. It was possible to stabilise the economy through the use of old measures for a while, but an indefinite continuation of old methods leads to a dead end. If you accept the necessity to change the Soviet system and if this is coupled with the acceptance of combining change with going through a crisis, then the combination of change and crisis along with a policy of detente and foreign policy successes does certainly provide better perspectives for the future. In the long run, what the Soviet Union needs is international integration and co-operation. The market in the Soviet Union needs the experience of foreign competition. Therefore, such foreign policy successes might eventually prove to be useful to a crisis-ridden economy like the Soviet Union. On the other hand, one has to accept the fact that there are many people in the Soviet Union who do not see successes in foreign policy. I had a discussion with a deputy-director of Novosti, the Soviet press agency, who told me (he did not pretend that this was his own conviction), that in the international field, the Soviet Union was falling back to the situation in 1939. One must therefore recognise the fact that Gorbachev's manoeuvres in foreign policy are viewed as successes more in the west than in the Soviet Union. Similarly, Gorbachev winning the Nobel Prize, while laudable in terms of international prestige, has not been received well by the population. G. Gerassimov, the spokesman of the foreign office, actually said in a semi-serious manner that Gorbachev did not receive the Nobel Prize for economics. But as I said earlier, if the dominant trend in the Soviet Union proves to be the one towards the market and democracy, then these foreign policy successes will have a positive effect in the long run.

RN: The reform experiences of the socialist economies are an eloquent

testimony to the hypothesis that the process of establishing a centrally planned economy is easier than dismantling it and replacing it with a market-oriented system. Why is this transition proving to be so difficult?

HH: There are many problems connected with the transition from a planned economy to a market economy. Foremost among them is the fact that a market economy needs a different kind of society. It needs entrepreneurial agents which in the Soviet Union were destroyed by the imposition of planned economy. A planned economy is in many respects, a passive economy in which entrepreneurial abilities are not needed in a strict sense. Of course some degree of entrepreneurial abilities did survive even in the planned system but these were directed towards personal profits, building careers and so on. Therefore, the society itself needs to undergo a change. The second type of change that is needed is in institutions: the biggest problem here is to go back to a legitimate and effective form of property relations. This was not necessary in Germany after the war because the old owners existed. Neither was there any major discussion about the legitimacy of private ownership. But in eastern Europe, it is a *tabula rasa* situation: the structural problems are so great that it is going to be very difficult to go back to a market economy. But this is by no means restricted to eastern Europe; it is the same in southern Italy, Latin America or Portugal. All these countries have problems with the market. So why should one expect that it is enough to abolish the planned economy and leap into the world of a perfect market. The main difficulty lies in the fact that the market economy is a difficult system.

RN: The current state of the economy and polity in the USSR makes it pregnant with all kinds of positive and negative alternatives. What in your view are the likely scenarios we may have to contend with in the future?

HH: I envisage a couple of different scenarios but whether they are likely or not is of course, another question. One scenario consists in the continuation of the present situation. This means that for a couple of years, the Soviet Union will have to be prepared to confront what is in greater or lesser measure a crisis situation. A colleague of mine described the present situation where in terms of stabilisation of chaos, very similar to the current situation in Yugoslavia. This essentially refers to a situation where in the absence of substantive reform, self-corrective and spontaneous arrangements co-exist with some elements of the old planning system in a manner in which the system does not completely breakdown. This kind of muddling through on a very low level of per-

formance is certainly one scenario that I have in mind. Another scenario consists of a situation in which the economic situation deteriorates to an extent when muddling through becomes impossible and a new consensus is reached through a coalition of Gorbachev and other progressive forces including new parties in the republics and that in the long run, a new stability is restored, with Gorbachev remaining president for another couple of years. Another scenario could consist in a deterioration of the economic situation and a kind of Soviet-Jaruzelski, very similar to a Polish-type situation with other governments in the republics that are not necessarily democratic; they may be partly authoritarian. There is always of course, the danger of a military coup—even the reformers are not able to rule that possibility out. This can happen against Gorbachev and can equally happen with Gorbachev. There is a tremendous amount of insecurity and it is very difficult to say what lies ahead. We must be careful because we have so often been surprised by actual developments in the Soviet Union, especially now that old paradigms do not function anymore. My own feeling is that there is still a certain chance of avoiding civil war and a right-wing dictatorship by a process which is already underway: the emergence of new democratic institutions. If these forces consolidate themselves, there is a good chance of a peaceful transformation. I therefore see the necessity of a perestroika partnership with the west. The west must help and there are currently several approaches on what the west can do. One way lies in the continuation of disarmament which will help to reduce the military sector in the Soviet economy. Another way lies in offering institutional arrangements with European institutions including transfer of know-how and so on. In my view, it is imperative that the west opens Europe for Russia and not to exclude either Russia or the Soviet Union from Europe.

Indian Development Strategy

An Exchange of Views

T N Srinivasan

We have to face up to the fact that our development strategy and the whole bureaucratic planning and control system that implemented it have failed. The failure is systemic.

Statement

The problems of India are other than mere bureaucratic delays or adherence to leftist principles. They go back to the abysmal poverty and to the glaring inequalities that exist in India.

Response

It is not the pursuit of 'egalitarian principles' that is at the root of Indian failure, but a development strategy and policy that robbed the poor while professing to serve them in the name of a 'socialistic pattern of society' and self-reliance. This strategy condemned the economy to an avoidably slow growth and bottled about 75 per cent of the rural labour force, a majority of them poor, in agriculture. The fact that the proportion of rural male labour force in agriculture declined from 83 per cent in 1972-73 to 74 per cent in 1987-88 is less significant than that the proportion is still so high after 40 years of planning! This can hardly be called egalitarian in its achievements whatever be its intent. Other economies which did not proclaim their egalitarian principles with great fanfare have achieved faster and more egalitarian growth than India.

Statement

It is inappropriate to compare India with South Korea or Taiwan and argue that India missed the opportunity for faster development. If India were to be divided into a thousand countries of the size of Taiwan, certain sections of it would doubtless record a rate of growth faster than Taiwan's.

Response

This is a silly argument. India is not *sui generis*. The belief that "comparisons with other countries, though occasionally helpful and useful, are illusory. They can never find the answers to the problems of any country at any time" [Arun Ghosh, *EPW*, June 18, 1991] is fundamentally misconceived. In any case, an overwhelming majority of the 100 or so developing country members of the UN are even smaller than Taiwan. But few of them can claim to have achieved the sustained and egalitarian development of Taiwan. If anything, the size of Indian economy with

its large internal market and a unified monetary system and few internal barriers to trade (if not labour movements) should have been an advantage rather than an obstacle to development. Once again our development strategy failed to exploit this advantage, but instead through 'planning' created high-cost inefficient industries of less-than-economic scale and sheltered them from foreign and domestic competition. Self-reliance, an arguably sensible objective, was perverted into self-sufficiency in everything. From a national resource allocation perspective, there is no particular advantage in self-sufficiency *per se*, whether it is with respect to food grains or to nylon stockings. Nor does national sovereignty and honour hinge on any particular exchange rate for the rupee—it is a price, albeit an important one, like any other price such as that of crude oil! Its administratively set value can be, and in India has been, unsustainable. What is crucial is that the economy generates enough foreign exchange through exports that are internationally competitive (and from borrowing) to pay for imports that cost more to produce at home. Borrowing is appropriate provided the borrowed resources are used in a way that the economy can service its debt in the future. Our self-sufficiency in many areas has been bought at a very high cost.

By some measures, the Indian economy is not large, thanks to a failed development strategy, in terms of value added our manufacturing sector in 1989 at US \$ 44 billion is smaller than South Korea's US \$ 54 billion. These figures, taken from Table 6 of the World Development Indicators section of the 1991 *World Development Report*, may overstate the Korean figures because they are in *purchaser's* rather than *producer's* prices, even if the usual problems of exchange rates used for conversion, etc, do not bias them in one direction. Still, it is unlikely that Korea's manufacturing sector would be smaller than India's given the rapid rate of growth of the former over the last three decades compared to India's. Table 17 of the same report shows that Korea's manufactured

exports to OECD countries totalled US \$ 43 billion in 1989 compared to India's paltry US \$ 8 billion. China's exports grew at 11.6 per cent per year on average during 1980-89, a rate that was twice India's. Closer to home, Pakistan's GDP grew at 5.2 per cent per year during 1965-80 and 6.4 per cent per year during 1980-89. The corresponding figures for India are, respectively, 3.6 per cent and 5.3 per cent. Thailand's performance is better than Pakistan's. The notion that comparisons with other countries are not very helpful is that of the proverbial "frog in the well".

Statement

South Korea and Taiwan are authoritarian regimes, while India is a plural democracy. Both countries are by no means *laissez faire* economies and their governments intervened in the economy extensively. There are many things wrong with us. But let us not run away with the idea that a *laissez-faire* economy will be the solution to our problems.

Response

It is naive to argue that the authoritarian regimes in South Korea and Taiwan had a lot to do with their success, while India's plural democracy explains its failure. Once again, authoritarian regimes are far more numerous than democracies in the developing world and not many of these have succeeded in generating egalitarian growth. Authoritarianism and small size are neither necessary nor sufficient for success.

There are no *laissez-faire* economies in the world. No one has ever suggested that Korea was a *laissez-faire* economy or that India should become one. The relevant issue is not that the Korean government intervened in the economy but that Korean interventions, unlike Indian ones, did not distort resource allocations seriously and, if they did, they were soon given up. For example, Koreans withdrew from investment in heavy chemicals when they found it was a mistake rather than run them in the public sector as sick enterprises!

Statement

India is a soft state—we do not tax the really rich and in fact, we do not collect the taxes that they should pay. What we have succeeded in doing in the last five years is to attain a rate of growth of 5.5 per cent per year at the cost of future growth, we are not only close to the debt trap internationally, we are in a debt trap internally.

Response

The Myrdal notion of the Indian state being soft is somewhat of a myth. Far from the softness of the Indian state in

the Myrdal sense, it is the softness of the budget constraint (to use Kornai's term) of the bloated Indian public sector and the bureaucracy that is at the heart of the problem. Be that as it may, the extent of redistribution that can be achieved through the fiscal system is fairly limited. If the socio-political system is unable or unwilling to redistribute assets, it is unlikely to redistribute income after its generation through the fiscal system anyway. Attempting to influence the distribution of consumption, through the negative instruments of industrial and import licensing is unlikely to succeed and has not succeeded in reducing inequalities. In the old days, automobile imports were banned because they were luxuries, but their high cost domestic production and administrative allocation at fixed prices to the elite was not viewed as inconsistent with egalitarianism. Pepsi is viewed as a luxury but Gold Spot is not! It should be obvious that under these circumstances the prospects for the poor depends on how fast the economy grows and raises the demand for and the returns on the assets with which the poor are endowed. Since in our economy the basic assets of the poor are essentially their labour, successful egalitarian development strategy would have emphasised skill accumulation and rapid growth of productive employment opportunities. Alas, the Indian strategy failed miserably in this regard.

Whether or not the rich are adequately taxed, it is certainly the case that the tax revenues as a share of GDP have risen substantially over the last four decades, but the revenue has been increasingly squandered. The revenue deficit reflects in part the growth in subsidies of various kinds (food, fertiliser, exports, etc) and the soft budget constraint of the public sector. But for the natural resource rents earned from the nation's petroleum resources, the losses of the public sector enterprises would be a much higher proportion of GDP. And the subsidies, particularly export subsidies, reflect the fact that a bad policy in one area imposes costs on another, to wit a restrictive import control regime and an overvalued exchange rate imposes costs on exports, which if not offset by subsidies, would affect exports adversely. The silliness of the policy, at least until recently, was that the import controls were largely in the form of quotas with tariffs being low enough to allow significant quota rents, thereby robbing the revenues that otherwise might have accrued to the state. Fertiliser subsidies in part reflect a whole series of bad policies relating to the domestic fertiliser industry and the inability to exercise the market power that a large importer such as India in principle has in international markets.

The faith of the fifties that the pricing, output and investment policies of the public sector would be used to generate resources for investment, to direct the private sector development along socially desirable lines, to set an example for the private sector as a model employer, and so on and so on, has proved to be naive, if not a malice, aforethought. Unsurprisingly, what happened, of course, is that the huge and over-manned public sector, including the public enterprises in the financial sector (commercial banks, LIC, etc.), has redistributed income in favour of the well off. Scandalously abused medical reimbursement schemes, leave travel concessions, subsidised housing, etc. to mention just a few, not only redistributed income to the well off which includes the labour aristocracy in the organised sector but eroded the revenue surplus. Anyone who has had dealings with the LIC can testify to its colossal inefficiency. The nationalised banks and term lending institutions are no better! They are over staffed, they over pay their staff and are inefficient. Aided and abetted by politicians through their loan moras and loan moras, they have reduced the commercial banking system to near bankruptcy while implicitly taxing their depositors by paying them low real interest rates. What all this means is that the savings of the public are being squandered by the LIC and financial system.

It is true that India is getting close to the debt trap and indeed we may catch the Latin American disease. However it is not just the policies of the last five six years that brought this about but the development strategy of the last four decades. The so called 5.5 per cent growth of the eighties is in part the reflection of employment expansion in the service oriented public sector. Since there is no direct measure of productivity in service sectors, if government pays a higher real wage to a larger number, even though there is no change in productivity, it will be counted as real income growth. But its cost would be reflected in larger budget and current account deficits financed by domestic and foreign debt. The otherwise interesting study of Vijay Kelkar and Rajiv Kumar [1990] which documents an increase in growth rate in the eighties in many industries does not examine whether total factor productivity increased (or at least did not fall) at the same time. Growth rate comparisons across countries and over time within a country can be misleading even if problems of aggregation, price deflation, exchange rate conversion were absent. After all, one could sustain growth for a while by simply using more and more inputs in the face of declining productivity as the Soviets did.

Such comparisons have to be supplemented by resource-use efficiency comparisons.

Statement

What is happening in eastern Europe and the USSR is tragic. It should certainly be an eye-opener. It shows that one should never get too far away from the people and that is what some of the party leaders in eastern Europe did.

Response

What is happening in eastern Europe, far from being a tragedy, is the inevitable denouement of a failed, oppressive and murderous system. Eastern Europeans are realising that it is the system that failed and has to be replaced. Mere reform of the old system is pointless. This is not to say that changing the system will be easy or costless. Nor is it to say that eastern European countries wish to or will become *laissez faire* economies. But what is clear is that the old system is dead as a door nail. The change-over to an as yet ill defined new system will be inevitably painful even if the rich industrialised market economies decided to help eastern Europe generously. After all, the mess accumulated over seven decades in the USSR and over four decades in eastern Europe cannot be costlessly cleared overnight. The destruction of enterprise and initiative had gone too far to be rejuvenated at a wink, societies that eliminated the market system cannot hope to revive it instantly. As per the current joke in that region, socialism is the longest and costliest road from capitalism to capitalism!

New Delhi - 110 002

For not was not the only one who massacred millions. Stalin did it before him and so did Mao who let over 20 million die in the avoidable famine of the late fifties. More and more horrors of the Ceausescu, Zhukov and Hoxha regimes are being revealed as time goes on. All this says something about their system! In eastern Europe the party was imposed on the people by Soviet power—the leaders were not close to the people to begin with. It should come hardly as a surprise to anyone in India that those who controlled the allocation of goodies allotted lots of it to themselves—the privileged life of the *nomenclatura* in the Soviet Union, the now-made-public lifestyle of Honecker and other East German leaders, not to mention the privileged life of the party elders in China, are what one should have expected to find whenever the veil of secrecy is lifted.

Statement

Opening up the economy to international competition is not the solution to India's problems. There is a real danger that recourse to IMF assistance in the short run may force the country into adopting policies that have a high long-run cost. The first step in liberating the Indian economy from the shackles of bureaucratic control is not trade reform of the type recommended by the World Bank.

Response

The statement reveals an unwarranted national inferiority complex. We are mature enough to examine suggested policies, regardless of the origin of the suggestions, on their merit: we should not accept unsound policy advice and reject sound ones depending on the source from which the advice originated. We need not fear competition, domestic or foreign: on the contrary, many of our failures in the industrial sector are due to lack of competition. The fact that any opening up to competition, domestic or foreign, will necessarily threaten the continued existence of some industries should not deter us from such an opening. The issue is not the reality of such adjustment costs: it is whether our present development strategy is sustainable. Clearly, if the pursuit of self-reliance and indiscriminate import substitution over four decades have not at all eased our balance of payments constraints and, in fact, have brought us to the desperate situation of having to go to the IMF and the World Bank in a position of weakness, rethinking of the strategy is surely called for.

We in India have to face up to the fact that our development strategy and the whole bureaucratic planning and control system that implemented it have failed. The failure is *systemic*, just as it was in eastern Europe. Merely changing the cast

of characters in the political leadership, bureaucracy and Planning Commission, but by and large keeping the system as it is, will not do. Changing the system does not mean changing the objective of our development: eliminating poverty should continue to be the overarching objective of policy. But what we need is a *system* that will achieve the objective, not one that grinds the poor down further all the time, chanting the mantras, self-reliance, socialism and planning. Alas the editorial and other pages of the *EPW* continue to invoke these mantras!

Let me conclude this exchange with an episode involving one of the most perceptive, pragmatic, non-ideological and dedicated of India's planners, the late Pitambar Pant, under whose guidance I had the privilege to work at the Planning Unit of the Indian Statistical Institute at Delhi. This episode was recently recalled by Attila Karaosmanoglu from Turkey who is currently a vice president at the World Bank. I quote,

I would like to conclude with one really precious memory I think it was in January 1961. It was two or three in the morning in the garden of one of the houses that were given to civil servants in India, and I was with Pitambar Pant. He kept asking me a lot of questions about Turkey in his machine-gun style. What is the rate of growth? What is the composition of GDP? What is the savings rate? What is this, what is that, etc., and I was trying to answer as quickly as I could that we had only an export level of

about \$ 500 million. We were trying to stretch our imagination to see whether we could make it \$ 550 million. Per capita income was over 150 dollars and the rate of growth in Turkey in those days for the last five years had been about five per cent. He turned to me and said, "Attila, why are you trying to plan?" He said, "If I get to that point, I will stop all the planning in India."¹

Attila concluded, "Maybe the time has come" for India to abandon planning, at least as it has been practised in the last four decades. I agree with him.

Note

[This is based on my correspondence (early in 1990) with a senior Indian economist. I apologise to him in advance if I have in any way distorted his views in the following statements. In any case, the views expressed in these statements are held by many, including many contributors to this journal.]

INTERNATIONAL TRADE IN TEXTILES

MFA Quotas and a Developing-Exporting Country

SRI RAM KHANNA

This pioneering case study of India examines the impact of MFA quotas on firms in developing countries engaged in producing and exporting textiles. It is based on a sample of 177 such units drawn from all over the country. Dr. Khanna highlights the impact of MFA quotas on the business behaviour of manufacturing exporting companies. He analyses the key question of how and when country level export quotas become binding at the level of the individual firm. In addition, the author examines the manner in which a market for buying and selling quotas develops in the exporting country and how firms adjust their pricing, production and internal management in response to the environment created by the MFA.

Among the issues covered are the composition of India's apparel exports, the utilisation of quotas, and the attitude of apparel exporting firms to various aspects of the MFA. In conclusion, Dr. Khanna discusses the implications of his findings for corporate policy makers and outlines strategies which are applicable to most developing countries engaged in exporting textiles.

Faces of Oppression

Ashok Rudra

Of Women, Outcastes, Peasants, and Rebels: A Selection of Bengali Short Stories edited, translated and with an Introduction by Kalpana Bardhan, University of California Press, 1990

FOR one would most enthusiastically agree with the author that many deeper aspects of the social reality can be understood much better with the help of literature than what is possible by the application of statistical, anthropological or sociological methods. Literature as social commentary helps us to "gain valuable insights not only into behaviour, but also into the thoughts, beliefs, and motives underlying behaviour." It also helps to "understand the micro sociology of behaviour within the layers of social relations—relations between individuals, between groups variously situated in society, between individuals and the group—and the contradictions in these relations." The author claims, and we agree, that "literary realism, which describes both the mental and the material lives of groups and individuals, is perhaps the only medium capable of revealing the nuances of the relations between the oppressor and the oppressed, between the dominant and the subordinate." With this philosophy of science in her mind, Kalpana Bardhan, who is familiar to the readers of this journal as a distinguished economist, has thought it fit to turn away from the kind of economics she did earlier and makes her appearance on the stage of literature as the translator and editor of a collection of Bengali short stories in English. Her purpose in undertaking the venture, in her own words, is "not so much to precisely represent modern Bengali literature by way of the short stories as to show the faces of oppression, the facets of power relations, and the figures of resistance and rebellion." A "connected purpose has been to reveal 'parallels' between different forms of oppression, and to present 'various angles'." The purpose has been amply served. In addition, almost as a byproduct, the volume also gives an idea to all readers who do not read Bengali, in India as well as the rest of the world, the wealth that is possessed by contemporary Bengali literature. For the stories selected are some of the finest examples of modern Bengali short story, many of which would certainly qualify to be in the very first rank in world literature as a whole. The editor explains why she has chosen stories rather than novels "because I could thereby encompass, within a book of manageable length, several aspects of the social processes seen at different levels and from different angles."

The aspects of oppression that the stories are selected to represent are various, the spectrum covered being very wide. It can

hardly be wider, as the following explanations by the editor indicate:

"Oppression does not always take the form of outright exploitation, subjugation, and antagonism. Love itself can oppress, when one is slave to false notions of love."

"Sometimes an idea or belief oppresses, especially when it is internalised by the victim, a process often condescendingly called 'false consciousness'."

"Underneath the seeming compliance in many of the cases, under widely different circumstances, exists a variety of struggles, resistance, rebellion and revolt—at the level of ideology and thought, and sometimes also at the level of action, gesture, and cultural practice."

Not only these, even "paralysis of the natural human urge to protect the loved one, especially one helplessly dependent on that protection", is also treated as an oppressor or rather "a key factor in the pathogenesis of oppression." The editor herself presents a classification of different kinds of oppressions covered by her.

"In seventeen of the twenty stories, the protagonist is either female or a member of a denigrated (outcaste, tribal, ethnic) community, and in at least four she is both. In six stories, the protagonist is a woman belonging to the middle or upper socio-economic strata. In six others she is a member of the labouring classes (peasants, wage labourers) in three cases also an untouchable outcaste. The woman's viewpoint, thoughts and behaviour form the central focus, the direct subject, of thirteen stories. In two or maybe three stories, she is the passive subject. In five or maybe six, she is a tragic heroine, the tragedy arising not from a contradiction within herself in the classical tradition—but from the crushing or disintegration of her personal battle of resistance. In three, she is the counterpoint to the constrictive social and familial patriarchy, from within which she battles."

All these different oppressions constitute nothing more and nothing less than what Malraux described as '*La Condition Humaine*' and what Somerset Maugham packed so powerfully into the phrase "Of Human Bondage". Kalpana's coverage is even wider for she includes even the theme of the Pakistani army's massacre of Bangladeshis in which she finds (very unconvincingly to me) a parallel with "the destruction of a rebellious lower class woman by socially superior men" the subject of two stories in the collection. It is intriguing why Kalpana

did not choose a simple title, like say, 'Faces of Oppression' but goes in for the clumsy one that she has. She has obviously tried to make a complete enumeration of the victims in her collection but as her own very learned and competent discourse on the themes of oppression and rebellion and the 'tactics of the powerless' shows, she fails to complete the enumeration. That, of course, is bound to be so as oppression is a continuum of the human condition and does not constitute a countable set.

Whether one wants to generally represent the quality of a certain literature or communicate the way a particular theme is treated in that literature, there can never be a selection that would satisfy all readers. The editor's selection, made with much thought and deliberation, is very much to my liking but for two stories. I would not have included Hasan Azizul Huq's story about the rape of Bengal by the Pakistani army for reasons of thematic cohesion: the story has not for me either any parallel or any intersection about which the author speaks so much. I would have also dropped Manik Bandyopadhyay's 'The Old Woman' for being utterly insignificant.

The other point which any book of translation demands to be commented upon is the quality of translation. As is agreed by all, there can never be any translation of poetry: there can only be trans-creations. It is a part of my ignorance about literary matters that I do not know if such a position is taken also about literary forms other than poetry. Whatever be true of translations from and to such languages as English, French and Russian, when it comes to translation from Bengali into English there cannot but be many problems which defy satisfactory solutions. The collection in front of us is no exception. When the translator uses the expression "golden moon" in connection with a person the Bengali reader would shudder but all the same understand that the original expression is 'sonar chand', a colloquial phrase used endearingly or mockingly. But when I come across a sentence like the following even as a Bengali I fail to reconstruct the original: "a daughter born is already gone to husband or death." And what Bengali reader would be happy with the following rendering of the famous last line of 'The Living and the Dead': "On all their minds rested the disturbing knowledge that Kadamini had died last night to prove that she was not dead before." Where is the ever lingering resonance following the dull cosmic thud of the sentence in the original? A free rendering of which would have been something like "By dying Kadamini proved that she was not dead."

This matter—faithfulness to the original in meanings and nuances—is best left aside, for trans-creation is itself an artistic activity and every artist has his or her own prefer-

ances and convictions. We, therefore, propose to restrict ourselves in the rest of our criticism to the long introduction by the editor. This part is just as important as the stories themselves, for here the author reveals her understanding of the particular world—social, political, psychological and moral—which the stories are supposed to tell about. The introduction is brilliant and learned and for that very reason is bound to be subject to differences on various points with any serious reader. The essay has got three connected overlapping parts. The first is a general and summary history of the social conditions in the region inhabited by the Bengali-speaking people. In a second part the editor says some words about the five authors selected—Rabindranath Thakur, Tarahankar Bandyopadhyay, Manik Bandyopadhyay, Mahasweta Devi and Hasan Aziz Huq. In the third part the author makes some critical introductory comments about each individual story.

About the first part I am glad to see that Kalpana has had the courage to use the phrase 'nineteenth century Bengal Renaissance' and express a positive appreciation of the men and women and their social practices which are referred to by that phrase. It is possibly not known outside Bengal to what extent it has become fashionable in Bengali intellectual circles, cutting across all ideological lines from the extreme left to the right, to dismiss the entire 19th century Bengal with all its reformist leaders for their unpardonable sin of having collaborated with the Britishers and not having taken sides with the numerous peasant and tribal revolts. Sushobhan Sarkar, whom the editor quotes, was a loner stoutly refusing to fall in line with the trend and so did a handful of other intellectuals. The writer of these lines has made himself quite unpopular in left circles for taking the stand that in judging an individual or an event in history as being progressive or not one has to keep the historical context in mind, otherwise one makes nonsense of the very concept of the 'progressive', which is a relative valuation. It is not only naive to apply to Ram Mohan Roy the yardstick that one may apply to a left intellectual in the last quarter of the 20th century; it is pernicious, given that even if one makes such an ahistoric comparison, Ram Mohan Roy and other leaders of the 19th century reformist movement may prove to be more committed to their country and their countrymen than most of their critics of the late 20th century who mouth 'subaltern' slogans but live in elitist style and surrender themselves to the cultural imperialism of the west much more greedily than their 19th century peers ever did. It is, however, a pity that Kalpana, after refusing to devalue the 19th century, gives in to the terrorising techniques of the fashionable subaltern school of intellectuals. She tends to overestimate the radicalism of the trends in the Bengali literature. The radical character of the stories in her selection do not represent the mainstream Bengali literature of the last one

hundred years. They are marginal and exceptional.

The following account therefore is not acceptable to us: "Bengali intellectuals, writers, poets, and artists who were young during the Tebhaga movement, the 1943 famine, and the subsequent food riots and marches, became radicalised in consciousness and creative expression. In their work they tried to confront the contradictions between middle-class sentiments and the realities of middle-class life, even within their own lives and surroundings."

I was once asked by a Bengali periodical to write a substantial essay on political novels in Bengali literature. I was quite aghast at the discovery that I made at the end of my extensive researches. I found that the sum total of political subjects treated centrally in Bengali literature is incredibly small. There seem to be hardly any novels which give any convincing portrayal of the freedom struggle either of the terrorist stage or of the later mass movement stage. It is appalling how the decade of the forties has been left almost untouched in all of Bengali literature. That decade shook with one trauma after another from beginning to end. There were in 1941 Japanese bombs and suddenly destituted refugees from Burma trekked into India, many of them on foot over the Arakans. In 1942 there was the Quit India Movement and in 1943 the Great Bengal Famine in which some millions perished, lakhs of them in the streets of Calcutta. After that the INA soldiers returned and Calcutta burnt with street fights between the mob and the police. In 1946 Hindus and Muslims massacred each other and after 1947 refugees from east Pakistan flooded into West Bengal. In 1949 Calcutta became the arena for the armed struggle unleashed by the Communist Party of India. Of all these epochal events only the partition has left a deep mark on Bengali literature. All the others have hardly received any attention whatsoever.

The editor records, probably correctly, that Mahasweta Devi, one of the authors selected by her, acquired her radicalism from the Naxalite movement but she is alone in that position. Incidentally, Kalpana gives a somewhat misleading account of the Naxalite movement. It was by no means a "revolt of tribal and landless peasantry against landlords and moneylenders in areas of northern and central West Bengal and south eastern Bihar." It was by and large a revolt of urban middle class youth *on behalf* of the tribal and landless peasantry. That is, one more case of a movement from above.

Our appreciation of Bengali literature is, therefore, altogether different from Kalpana Bardhan's. The forte of this literature, according to us, lies in its portrayal of individual and social life by the strictly impressionist method—impressionism to be understood, as distinguished from expressionism—and, in addition, innocent of any ideological colours and also innocent of any analysis of any problems.

The brief sketches of the authors that the editor presents are useful and adequate and do not invite many comments excepting in one case. Kalpana Bardhan, like everybody else in the world of Bengali criticism, highly over-rates both the radicalism and the pure literary qualities of Manik Bandyopadhyay. As Bengali readers know, Manik has by now become something of a cult figure, the supposed first 'really modern' writer in Bengali; according to some, the best novelist since Tagore. I, however, think that Manik's modernism is no more than a phony mixture of party line Marxism and superficial Freudianism.

The brief notes that the editor provides for each selected story are all extremely perceptive and penetrating. Frankly, I have to admit that she has succeeded in drawing my attention to meanings and significances within many of the stories of which I was not aware from my own readings. But here, too, Kalpana is time and again led astray by her subaltern bias. She discovers in the downtrodden characters a consciousness and stances which are not there but are merely projections of her own values. Talking of a peasant, Karam Ali, she writes: "Like many other toiling peasants, he is profoundly aware of the enormity of his oppression as well as the enormity of his resistance." It is, however, not true that there are all that many Karam Alis among Bengali peasants. That the author is projecting her own consciousness into her characters is quite clear when she writes about Mahasweta's most power

the story 'The Living and the Dead'—a relation that is brutish and nakedly business-like—the very word 'love' seems to be out of place. To see in the story any "monstrous oppression wrought ultimately by the exploitation of the landless peasant in rural Bengal" is only a projection of an elite mind in search of subaltern visions. One more example. The suicide in the finale of the Tagore story 'The Living and the Dead' is for me an action taken in sheer desperation in the heat of the moment. Kalpana finds 'boldness' in the act and a motive to shame the people who are the unwitting cause of her distress.

Even apart from the editor's penchant for discovering class consciousness where it does not exist there are many other interpretations she gives of many stories which I find difficult to agree with. For example, the comments she makes about Tagore's story 'The Punishment'—undoubtedly one of the very best short stories ever written—are for me quite bizarre. Kalpana talks of insult of 'conjugal love' whereas in my understanding in

the kind of marital relationship depicted—a relation that is brutish and nakedly business-like—the very word 'love' seems to be out of place. To see in the story any "monstrous oppression wrought ultimately by the exploitation of the landless peasant in rural Bengal" is only a projection of an elite mind in search of subaltern visions. One more example. The suicide in the finale of the Tagore story 'The Living and the Dead' is for me an action taken in sheer desperation in the heat of the moment. Kalpana finds 'boldness' in the act and a motive to shame the people who are the unwitting cause of her distress.

We need not give any more examples. Any high quality work of art is a many splendoured diamond and different appreciations by different readers of the same piece of work is only normal. That in no way detracts from the merit of the volume that surely is an important contribution to literature and literary criticism.

Pyu Civilisation

Peter Nolan

The Ancient Pyu of Burma, Volume I, Early Pyu Cities in a Man-Made Landscape by Janice Stargardt; Cambridge, PACSEA, in association with ISEAS, the Institute of Southeast Asian Studies, Singapore, 1990, pp XXIX + 416, notes and bibliography, 135 figures, 35 plates, including 3 folding mosaics of aerial photographs of Pyu cities and landscape with 3 associated archaeological maps in pocket, £47 hardcover, £27 softcover

THIS elegant piece of archaeology is of great interest to historians and social scientists. It provides the first instalment in a projected two volume work on the Pyu culture of Burma, which lasted from the second century BC to the ninth century AD. The book is based on both the author's own research and that of the Archaeological Survey of Burma. This volume presents extensive detailed evidence on one particular site, Beikthano as well as providing information on comparative features of each of the four main Pyu cities.

The Pyu civilisation developed in the dry 'niche' in Burma's meteorological map, namely the upland river valleys which eventually fed into the Irrawaddy floodplain. It might appear paradoxical that an irrigation based rice agriculture should develop away from the areas of highest rainfall, yet Stargardt demonstrates that far from being the exception, the Pyu shared this characteristic with other irrigation rice cultures of south east Asia. She argues convincingly that water supply could be controlled more successfully away from the main floodplain on smaller rivers. At the centre of her account of the emergence of Pyu civilisation is a detailed description of the Pyu irrigation system. The technology includes tanks with their associated bunds and (probably) sluice gates, a variety of weirs with different associated devices to control the flow of water, and complex systems of canals. The

system inescapably brings to mind the more famous ancient Chinese irrigation system, Du Jiang Yan, in Sichuan province, about which much has been written.

Inevitably the easiest archaeological remains to identify are those of urban centres. From the associated evidence Stargardt demonstrates the sophisticated cultural level attained by the Pyu. They developed a complex state structure. Almost certainly, their economy was characterised by considerable socio economic differentiation based on private land ownership with an associated land market, long distance trade, and division of labour within the handicraft industrial sector. Pyu cities were much larger in area than their contemporary European counterparts. Unlike European cities, the Pyu cities incorporated considerable areas of farmland (and associated irrigation systems) within the city walls, alongside a European style core area of dense urban settlement and markets.

This volume contains a detailed account of the Pyu belief system. This includes the relatively independently-developed concepts of the pre-Buddhist epoch as well as the later process of absorption and 'Pyuisation' of Buddhism. Stargardt analyses the ways in which the Pyu established trade contacts with Buddhist cultures well before Buddhist ideology took a strong root among the Pyu people.

For this reviewer, the most interesting aspect of the book is its analysis of the connection between Pyu irrigation systems and the nature of Pyu state and society. The Asiatic Mode of Production approach would see the complex Pyu irrigation systems and the associated cultural development as evidence of irrigation technology providing the functional necessity for a strong despotic state to organise irrigation. Stargardt's line of argument parallels that of Ho Ping-ti (*China Cradle of the East*, Chicago, Chicago University Press, 1974) in relation to early Chinese irrigation. She demonstrates that, despite their ingenuity and sophistication, the Pyu irrigation systems were not generally large centrally-directed projects. Rather, the typical level of organisation was the village. At their peak, the Pyu kingdoms owed their prosperity above all to the large agricultural surpluses facilitated by irrigation. However, the main body of the Pyu irrigation works were developed through local experimentation and local solutions to the requirements of collective action necessary to build them. Especially striking is the evidence which Stargardt uses from British colonial hydraulic engineers who found the basic features of the irrigation systems still operating, albeit in reduced form, one thousand years after the end of the Pyu civilisation.

The question which springs to mind is why it should have been that some traditional rice growing Asian societies (e.g. large parts of central and southern China) were more successful than other areas in Asia (e.g. much of India) at developing village based solutions to the problems of co-operation presented by the need to construct complex irrigation works if agricultural yields were to be pushed to higher levels enabling higher densities of population. Stargardt does not follow the 'Boxerup' track of relating agricultural technical progress to growing population pressure, and it may anyway not be possible to explore this line of argument rigorously with the evidence she has available. However, her account leads one to speculate in this area even if the causes of technical progress in Pyu agriculture cannot be identified unambiguously.

A brief review cannot do justice to the high degree of interest in this outstanding piece of scholarship. It is of great value not just to south east Asianists but also to anyone interested in comparative political economy of ancient civilisations. Indeed, the work is distinguished by its insistence on integrating a detailed analysis of the minutiae of archaeological evidence with the wider sweep of socio economic analysis, often with illuminating comparative insights. Janice Stargardt and the Cambridge project on ancient civilisation in south east Asia are to be congratulated on their pioneering work in this area (or which this volume is but a part) which has hitherto received far less attention in archaeological studies than it deserves.

“Wear it near the heart”

This flag is a Symbol
Symbol of our Independence
Symbol of the sacrifices made
by millions during our struggle
for freedom

We remember today the people-
of all religions, all castes,
all languages all States, rich

Girl-Brides and Socio-Legal Change

Age of Consent Bill (1891) Controversy

Meera Kosambi

The Age of Consent Bill enacted in 1891 formed a vital link in the movement for women's emancipation in the 19th century. The major women's issues of the time were abolition of child marriage, more humane treatment of widows and their right to remarry and education of women. The age of consent issue was integral to the child marriage question and the technical distinction between the two was often blurred in the actual controversy. The Consent Bill aimed to set a reasonable age limit below which a girl was considered to be incapable of giving consent to cohabitation and thus to ensure that her childhood was protected from physical coercion.

This paper attempts to analyse the major strands of this controversy. The author's focus is primarily on Maharashtra, but parallel movements in other presidencies and provinces are also covered.

THE recently celebrated International Year of the Girl Child coincidentally marked the 100th anniversary of what was, in retrospect, India's uncelebrated, but by no means unnoticed, Year of the Girl Bride. In fact, it was a landmark event which caused an uproar throughout the subcontinent, forging alliances and creating fissures along social, cultural and political lines. The brief but intense period spanning the controversy sent reverberations into many spheres of domestic as well as public life, reaching well into the future.

The epicentre of the controversy was the Age of Consent Bill whose introduction practically launched the year 1891 and whose enactment was concluded before the year completed its very first quarter. Today, a hundred years later, the bill might seem neither radical nor revolutionary enough to have provoked such a disproportionate reaction, unless it is examined against the contemporary social reality. The bill proposed to set a minimum age limit of 12 years for girls with regard to cohabitation, thus affording girl brides a protected childhood.¹ This proposal struck at the very heart of the orthodox Hindu marriage system and threatened its patriarchal ideological mooring.² The whole issue, socio-religious at the core, was soon engulfed in legal and political debates, and acquired a significance far beyond that merited by its technical nature as a legal amendment to raise the earlier age of consent set at 10 years by the Indian Penal Code.

This essay attempts to analyse the major strands of this intricate controversy. An appreciation of its implications for and impact upon the contemporary society is facilitated by setting the socio-legal context in Section I, the progression of events from the early momentum in the mid 1880s to the final climax in 1891 is traced in Section II, the nature of the controversy and the principal issues involved are described in Section III and finally, Section IV concludes with a brief glance at the political repercussions of the controversy.

I

The Socio-Legal Context

The age of consent controversy formed a vital link in the general, albeit largely unorchestrated, movement for women's emancipation in the 19th century. As is well known, the major women's issues were the abolition of child marriage, a more humane treatment (and if possible, remarriage) for widows, and education for women. The age of consent question was integral to the child marriage question, so that the technical distinction between the two was often blurred in the actual controversy.³ Traditionally, the Hindu marriage sacrament consisted of two components. The first part was the wedding ceremony itself which was mandated to take place any time during the girl's childhood, from infancy to about the age of 10. The second part was the consummation or *garbhadhan*—literally, the impregnation or conception ceremony—a name which directly linked sexual intercourse with the sacred duty of procreation. It was obligatory to perform it within 16 days of the bride's first menstruation. This latter custom was endangered by the age of consent proposal because of the possibility of the bride's reaching puberty during the two crucial years between 10 and 12. This potential threat generated the controversy which brought into focus, for the first time, a whole complex of women's issues interlinked with the marriage system.

Firm foundations of the patriarchal ideology which underpinned the 19th century society and locked its women into the life-long wife-mother role, were laid down centuries earlier in the Hindu religious and socio-legal treatises. In its authoritative tone, the *Manusmriti* had declared the woman to be inherently weak and in constant need of discipline, having been endowed by the Creator specifically with a love of her bed, her seat, and ornament, and generally with impure desire, wrath, dishonesty, malice, and bad conduct. It was imperative, then, that she be constantly controlled by a

man—the father in her childhood, the husband in adult life, and the son in her widowed old age—undeserving as she was of independence. The surest means of controlling her sexuality was to harness it to marriage and childbearing, and this primary wife-mother role was sacralised through the performance of the *garbhadhan* ceremony. This ritual therefore acquired a pivotal significance as the socio-religious sanction which turned the girl-woman into a legitimate instrument of her husband's sexual gratification and a medium of procreation.⁴

This male-dominated normative framework, which treated the woman as an appendage and property of her husband, rendered the concept of 'consent' irrelevant in a marital relationship. In the eyes of the orthodox, the Hindu scriptures entitled a girl not to freedom, but to be given away as a (sacred) gift—through 'kanyadan'—to her husband [*Indu-Prakash*, February 9, 1891:3]. By definition, then, the person who gifted her away also bestowed her consent on her husband.⁵ In addition, the onset of puberty in a girl was construed as a clear signal given by nature for the commencement of married life, irrespective of her age at the time.

In strong opposition to this stance, the reformers (while retaining a patriarchal view of women's subservience and their primary wife-mother role) insisted on a higher level of physical maturity in the girl bride before starting married life so as to avoid harming her. In terms of social change, the reformist position sought to ameliorate the harshness and extreme expressions of the patriarchal system rather than to challenge it altogether.⁶

Translated into concrete action, this position had already successfully initiated legislation to advance the women's cause, such as the abolition of 'sati' in 1829, the legitimisation of Hindu widow remarriage in 1856, and the abolition of female infanticide in 1870. The proposed Consent Bill aimed to set a reasonable age limit below which a girl was considered to be incapable of giving consent to cohabitation, even with

her own husband, and thus to ensure that her childhood was protected from physical coercion. This was presented primarily and emphatically as an amendment to the existing law, or what amounted to plugging a legal loophole. The Indian Penal Code, in operation since 1860, listed a series of offences which were punishable if committed against a non-consenting person. It also laid down the minimum age limit varying from 10 years in certain cases to 12 or even 16 in others, below which a person was considered to be unfit to give intelligent consent to an offence committed upon him/her. As far as cohabitation within or outside marriage was concerned, the law laid down 10 years as the minimum age limit for a girl below which intercourse with her was punishable as an offence of rape. Above this age limit, intercourse by the husband (with or without the wife's consent) was not an offence, and intercourse by a stranger with the girl's consent, was not punishable. The discrepancy among the various minimum age limits for "consent" was the crux of the legal angle of what was essentially a social (and religious) controversy. While an increase in the minimum legal age limit for cohabitation from 10 to 12 years, as proposed by the reformers and laid down in the bill, would protect the girl, it would, in some cases, violate the injunction to consummate marriage immediately upon the wife's reaching puberty. The girl bride's right to protection was thus pitted squarely against the husband's marital right, also enjoined by religion as a sacred duty.

II

The Progression of Events

The question of child marriage pioneered the tradition of nationwide networking among reformers and produced a considerable exchange of ideas across regions [Heimsath, 1962:491-92, 1964:147-48]. Consequently the age of consent controversy, although ignited first in the Bombay Presidency, swept across all parts of the subcontinent and even penetrated into Britain. The present article focuses primarily on Maharashtra, but attempts to cover parallel movements in other presidencies and provinces as far as possible (without however making any claim as to the adequacy of this coverage).⁷

The three pronged and mostly simultaneous progression of events included, firstly, the initiatives taken by Behramji M. Malabari, a Parsi social reformer, secondly, the legal machinery of the government leading first to the bill and then to the act, and thirdly, the agitation by reformers and anti-reformers.

The chain of events culminating in the passage of the Age of Consent Act of 1891 may be traced with justification to the note on infant marriage in India (together with that on enforced widowhood) circulated from Bombay on August 15, 1884, by Malabari. This, in itself, was a somewhat

paradoxical event, since the problem of child marriage was considered to be practically non-existent among the Parsi community.⁸ Also, the move was resented as undue interference from an uninformed outsider into Hindu affairs. However, Malabari's influence over progressive thinkers, both in India and in Britain, was considerable. The note on infant marriage (loosely interpreted as child marriage) vehemently castigated the practice as a more serious evil than infanticide which had already been abolished by British law. "For, whereas the latter was one short struggle, in which the victim was almost unconscious, an ill-sorted infant marriage entails life-long misery on either or both parties. Infant marriage is the cause of many of our social grievances, including enforced widowhood." The worst case scenario painted by Malabari was that of "married martyrs", "socially alienated from each other, though perhaps living under the same roof." Even in the event of the marriage turning out to be happy, there was another set of problems in store for the couple. "A too early consummation of the nuptial troth, the breaking down of constitutions and the ushering in of disease, the giving up of studies on the part of the boy husband, the birth of sickly children, the necessity of feeding too many mouths, poverty and dependence, a disorganised household leading perhaps to sin. In short, it comes to a wreck of two lives, grown almost old in youth, which might, in favourable circumstances, have attained to happy and respected age. That this is not an overcharged picture will be admitted by those who have even a superficial acquaintance with the domestic affairs of our people." [Gidumal, 1988:15]. This last assertion was too optimistic because many readers of the note did brand it as an exaggeration. However, the reformers were later to use most of these arguments while advocating late marriage or late consummation of marriage.

Malabari went on to claim that child marriage had no religious sanction in the 'shastras' and that the State should therefore treat it as an economic question ("as a source of over population and consequent disturbances") and follow a policy of inducements for late marriages and penalty for early ones. These would include a preference for unmarried candidates for government jobs, all other qualifications being equal and gradually disallowing married students from taking university examinations. In addition, school books were to propagate for late marriages. In his revised note II on infant marriage dated October 23, 1884, Malabari reiterated the main points and pleaded for greater state co-operation. [Gidumal, 1988:38-42]. Malabari's notes were followed up by an ambitious symposium of Hindu domestic reformers and anti-reformers from all parts of India organised by his close associate Dayaram (Gidumal), around the two issues dealt with by Malabari namely, infant marriage and enforced widow-

hood. The deliberations (published in 1889) covered multiple facets of the two social problems, methodically classifying the relevant facts, probable causes, requirements of the Hindu law, and proposed remedies; and a series of appendices further elucidated vital points, such as the existing legal provisions, medical opinions, and the 'shastric' injunctions.

Having failed to arouse the Indian people or the Indian government to action, Malabari shifted his arena to Britain in August 1890. This second phase was inaugurated with the circulation of a pamphlet on the same two issues, entitled 'An Appeal from the Daughters of India', targeted at the British public and especially British women. On its heels came the formation of a committee of the British elite concerned enough to take active steps in the matter. Into this committee were inducted the Earl of Northbrook, Lord Reay, the Marquis of Ripon, the Earl of Kinnaird, Prof and Mrs Max Muller, Mr and Mrs Ilbert, Cardinal Manning, Dadabhai Naoroji and others [Indu Prakash, September 1, 1890:3].

On the legal front, the demand for consent legislation was considerably reinforced by two court cases, exposing different aspects of the question of child marriage, which erupted on the national scene. The first of these was the Rakhmabai Case in Bombay. 19-year-old Rakhmabai (from an educated non-Brahmin elite family of Bombay) had been married in her childhood but refused to reside with her husband on the grounds of socio-economic and personal incompatibility. Her husband filed a suit for the restitution of conjugal rights, the court case dragged on from 1884 to 1888 (during which Rakhmabai was threatened with a prison sentence), and ended in an out-of-court settlement in which he relinquished his claims on her. The controversy which raged around the case was a confrontation between the largely traditional society and the reformers who sought to introduce the western values of choice and compatibility in marriage which presupposed adult marriage [Kosambi, 1988]. The second incident was the 'Calcutta child-wife murder case' of 1889, involving 10-year-old Phulmony, married to Hari Mohan Maitee who was over 30 years of age. Phulmony died in agony, allegedly on the wedding night, and her husband was charged with murder. The much publicised case led to the coining of the term 'Harimatism' to refer to "the noxious practice of early consummation" [Indu Prakash, October 6, 1890:3]. Two dire results of child marriage—incompatibility leading to unhappiness and disruption of the bride's life, and premature consummation leading to the bride's death—were thus highlighted.

Ultimately the Age of Consent Bill drafted by Sir Andrew Scoble to amend Section 375 of the Indian Penal Code was introduced by the viceroy of India, Lord Lansdowne, into the supreme legislative council on January 9, 1891. The age of consent was raised to 12 years in the case of both

married and unmarried girls, but in the case of married girls the offence by the husband was made non-cognisable, and the law was to apply to all religious communities [*Indu Prakash*, January 12, 1891 3]. The viceroy's council included 11 European, two Muslim and two Hindu members. Of the last two, Sir Romesh Chunder Mitter of Bengal opposed the bill on several grounds (examined in detail below), such as "widespread discontent, the existing law being sufficient, departure from the wise policy of non-interference with religion, and from the promises of the Proclamation, the law being a cause of annoyance and molestation, it being anomalous that a husband should commit a rape upon his wife, the marriage relations being unhappy in case of prosecution, reform being put back and agreement between reformers and anti-reformers being made impossible." The other Hindu member, Rao Bahadur K. L. Nulkar of Bombay, however, "somewhat redeemed the name of educated India by taking a resolute stand in favour of the Bill" emphasising its protective aspect [*Indu-Prakash*, January 19, 1891 3]. A select committee including both the Hindu members was then appointed to review the question, and presented its report, suggesting minor amendments, on March 6, 1891, while Mitter submitted a minute of dissent. On March 19, 1891, after a day long debate of well reasoned and incisive speeches, the Age of Consent Act was passed, and offences under it were made triable only by district magistrates (whose posts were reserved for the British).

The manifestation of the third element that of nation-wide public agitation about the consent legislation, had paralleled both these other developments. The general contemporary perception was that the Bombay presidency "had no business to show any dissatisfaction" (presumably for having initiated the demand for reform), that only Bengal exhibited "any real feeling of dissatisfaction", while Madras wisely "went in heartily for reform" [*Mahratta*, May 10, 1891 4]. In fact, however, the Bombay presidency had pioneered social agitation side by side with reform. One of the earliest reactions to Malabari's campaign was an orthodox Hindu protest meeting at Madhavbag in Bombay in 1886. History later repeated itself: the constitution of Malabari's English committee resulted immediately in the Tulsibag meeting (at Pune in October 1890), and the introduction of the bill in another meeting at Madhavbag in Bombay (in early February 1891). The reformers' prompt counter-offensive consisted of public meetings (in February 1891) at Javerbag in Bombay and at Krida Bhuvan in Pune. A spate of memorials was sent to the viceroy by the conveners of these and other similar meetings. To these was added a much publicised appeal by several educated women of Bombay petitioning the queen empress for reform in the Hindu marriage customs [*Mahratta*, October 5 and December 14, 1890].⁹ Protest meetings against the bill

were held also at Jalgaon, Ahmednagar, Nagpur, and Surat in February 1891 [*Mahratta*, February 22, 1891 4]. The actual passage of the act in March 1891 did not stem the flow of agitation, and protests not only continued but even intensified. For example, a resolution was passed at Solapur to send a deputation to Britain to enlist public opinion against the act, so that eventually the British parliament could be pressurised to direct the Indian government to repeal it [*Sudharak*, March 30, 1891 2]. Professor (later Lokmanya) Bal Gangadhar Tilak moved a resolution at the Bombay provincial conference blaming the government for utter disregard of public opinion in passing the act [*Mahratta*, May 17, 1891].

By all accounts the Bengal presidency exhibited the most violent reaction. Calcutta was swept by a 'mad fury' and almost 'convulsed' by 'an unseemly agitation'. Soon the anti-bill agitation was 'spreading like wild fire' throughout Bengal [*Indu-Prakash*, January 19, 1891 4, February 2, 1891 4]. A 'monster mass meeting' at the Calcutta Maidan in late February attracted a vast assembly of "Hindu, Mahomedan, Jain, Buddha and other communities of Calcutta and neighbourhood", reported a telegram. "Even the blindest supporters of the bill admit Calcutta had never seen such spectacle" [*Mahratta*, March 1, 1891 4]. The opposite side countered this mass mobilisation by distributing pro reform pamphlets and holding meetings [*Indu Prakash*, February 16, 1891 3, March 9 1891 3].

In the Madras presidency, a public protest meeting was organised by Raja Sir T. Madhav Rao in November 1890 at which an open clash occurred between him and Dewan Bahadur R. Raghunath Rao [*Mahratta*, November 23, 1890 3, December 14, 1890 3]. (T. Madhav Rao, once an ardent champion of the women's cause reversed his position completely on all the related reform issues, including the age of consent.) The allegation of a lukewarm opposition in Madras was further dispelled by its anti-reform spokesman A. Sankariah (president of the Madras Hindu Sabha and a former judge and magistrate) by stressing that "This act is virtually a missionary attack on the modesty, virtue and holy sacraments of the native females. His protest was supported by influential residents of the south such as the secretary to the social conference of south India, some members of the royal family as well as the ex-dewan of Travancore and a member of the Madras legislative council [*Mahratta*, May 10 1891 4].

Similar protests took other parts of the country. At a public meeting in Ameer Pandit Shyamji Krishna Varma (a barrister at law and one time lecturer in Sanskrit at Oxford) attacked the bill using both the Proclamation argument and the religious argument (reviewed below) [*Mahratta*, February 22 1891 4].

Concerted nation-wide action supporting reform had in the meanwhile been undertaken by the organisers of the third social

conference held at Bombay in December 1889. The resolution moved at the conference by Justice Mahadev Govind Ranade stressed not only the ill effects of early completion of marriage but also the discrepancy in the Penal Code regarding the age of consent in different cases. The resolution read as follows: "That, in the opinion of this conference the distinction made by the Penal Code between the general age of consent (12 years) laid down in Section 90, and the special age prescribed in clause 5 and the exception in Section 175 [i.e. 10 years] is both unnecessary and indefensible, and that with a view to prevent early completion of marriages which leads to the impairment of physical health of both husband and wife, and to the growth of a weakly progeny, cohabitation before the wife is 12 years old should be punishable as a criminal offence, and that every effort should be made by awakening public conscience to the grave dangers incurred to postpone the completion of marriage till the age of 14 at least, as being in accordance with the dictates of our ancient medical works and modern science and countenanced by the approved sentiment and practice of the country" [Ranade 1915 42].

The fourth social conference was convened at Calcutta in December 1890 while legislative measures were already under active consideration so that only a brief and general resolution was adopted touching upon the issue. That this conference is of the opinion that the practice of child marriage be discouraged by public sentiment, and that within the sphere of the various caste and communities strenuous efforts be made to postpone the celebration of marriage rites till 12 in the case of girls and 18 in the case of boys, and the consummation of the marriage till after they attain the ages of 14 and 20 respectively and that the members of the various social reform societies in the country should in their own cases themselves see that those limits of age are realised in actual practice and public opinion educated to advance these limits still higher. [*Sudharak*, January 12 1891 2].

III

The Controversy

In the considerably wide spectrum of opinion which was articulated during the controversy three staunch positions emerged. At one extreme was the self-styled orthodox or anti-reform faction (or 'party') which maintained that the contemporary marriage practices posed no problem and could not or need not be changed partly because they were derived from the ancient sacred texts and partly because they suited the existing social conditions. This faction was represented mostly by shastris and pandits, as for example by Ramshastri Apte of Pune in the Bombay presidency and Pandit Sridhar Larkchuramani of Calcutta in the Bengal presidency.

At the opposite pole was the reformers' faction claiming that the ancient texts had been misconstrued and should be rightly interpreted and followed, which would itself introduce improvement, and that also on the grounds of the welfare of women and of society at large, reform should be introduced, if necessary, through government legislation. The champions of this faction included Dr (later Sir) Ramkrishna Gopal Bhandarkar, Justice Ranade, Justice Kashinath Trimbak Telang, Prof Gopal Ganesh Agarkar, Rao Bahadur Krishnaji Laxman Nulkar, and others in the Bombay presidency, and Dewan Bahadur R Raghunath Rao of Madras.

Somewhere in the middle, according to *Indu-Prakash* was a third faction, that of the 'reactionists', which supported limited reform to be achieved strictly and solely through influencing public opinion. The paper insisted that 'the real fight' was not between the reformers and the orthodox, but "between reformers and reactionists, the latter a class of men as well educated as the former, and who by their beliefs and conduct are quite as much outside the pale of true orthodoxy as the first, but who wish to pose as leaders of the orthodox" [November 3, 1890 3]. Bal Gangadhar Tilak and Prof Jinsivale of Pune were identified as belonging to this faction. By the same token, T Madhav Rao and A Sankariah of Madras, and Romesh Chunder Mitter of Calcutta can be classified as reactionists. In effect, however, it was basically a cleavage between the orthodox faction (most vocally supported by the reactionists) and the reformers.

The controversy itself hinged on the following basic issues: (1) whether the ancient Hindu law prescribed child marriage and early completion of marriage as mandatory (labelled by the orthodox as the 'religion in danger argument'), (2) whether contemporary practice, derived from hallowed tradition, sanctioned early marriage and consummation, (3) whether child marriage resulted in harmful effects for the girl bride, her family, and society as a whole (the 'physiological argument'), (4) whether, if reform should prove to be necessary, it should come through voluntary action (the 'self-help argument') or through government legislation, (5) whether the proposed legislation violated the promise of non-interference made by the Proclamation of 1858 (the 'Proclamation argument'), and (6) whether the proposed bill would indeed succeed in protecting girl brides.

A few prefatory observations are necessary at this juncture. First, the controversy can not be viewed as a conflict between the proponents and opponents of the patriarchal ideology. Both factions subscribed to the basic patriarchal premises, the difference was that of degree, with the reformers adopting a humane perspective with regard to women but within the confines of the latter's generally subservient role, as mentioned above. Perhaps the best statement of this position came from Sir William Hunter in

a letter to the *London Times*: "How to secure for their wives and daughters the old safety of dependence with a larger measure of the freedom of modern independence, and how to effect the transition with the least disruption of religious tradition and of family life—this is the fundamental problem of Indian domestic reform" [*Indu Prakash*, October 20, 1890 3].

Secondly, given the number and complexity of the interrelated issues involved, some fluidity of positions was inevitable, and resulted, on occasion, in seemingly strange convergences and divergences across the factions. This was most prominent in the cases of Tilak in the Bombay and T Madhav Rao in the Madras presidency.¹⁰ However, by the time the bill was actually introduced the positions had crystallised firmly and battle lines drawn clearly.

Thirdly, the style and terminology employed in describing physiological functions were quite explicit in the Marathi and presumably other vernacular press (stamped by the graphic and precise vocabulary of the liberally cited Sanskrit texts) to an extent unimaginable in today's public debates and journalistic writings. *Indu Prakash* was moved to bemoan this publication of a very private family matter, in a Marathi editorial entitled 'The Scope of the Consent Bill Agitation': "A topic too embarrassing to discuss openly among the members of any decent family, and a decision about postponing the conception ceremony, customarily made solely with the consent of the parents and without even a thought of consulting the concerned parties—these have now come for deliberation before high officials in a foreign country and caused gigantic public meetings and agitation throughout the country, because we ourselves have not made any effort for self improvement" [March 16, 1891 2 *].¹¹ The English language press attempted to maintain delicacy by resorting to veiled phrases such as 'the occurrence of a certain event' and 'the certain well known sign' to refer to the start of menstruation.

Fourthly, while the agitation started as a social and religious debate, its political repercussions for the nationalist struggle were not slow in manifesting themselves.

Lastly, although the British opinion by and large, supported both the raising of the age limit for cohabitation (and also for marriage in general) as well as government legislation to achieve this, there were a few dissenting voices which were well publicised by the orthodox faction. An excellent representative example of the latter was Frederick Pincott who published a lengthy essay on the Hindu marriage agitation ending with conclusions which covered practically the whole battery of opposition arguments. That an early marriage ceremony followed by actual marriage at adolescence is compulsory on Hindus, in obedience to the prescriptions of their religion: "That it is a custom founded on the laws of nature, and is especially suitable to tropic regions." "That it has existed for

thousands of years and has been the cause of the good order, peace and happiness which characterises Indian homes"; "That it has preserved the modesty and womanly virtues of Indian women"; "That English marriage customs are lowering to woman-kind, and are directly responsible for some of the worst features of English social life"; "That the proposed Age of Consent Bill would be an engine of oppression, and would be most of all injurious to the women whom it professes to protect"; "That the bulk of the people of India, both educated and uneducated, are thoroughly opposed to the change"; and "That the change could be forced on the people of India only at the cost of an amount of disorganisation and discontent out of all proportions to even the imaginary benefits contemplated" [*Mahratta*, May 24, 1891 5].

THE "RELIGION IN DANGER" ARGUMENT

The question as to whether the proposed bill would involve a violation of the Hindu religious injunctions and thus threaten the Hindu marriage institution itself was considerably complicated by the fact that many of the sacred texts contained vague and sometimes internally inconsistent statements, and also contradicted one another on vital points. Two opposite interpretations were possible and were, in fact, advanced. The orthodox interpretation insisted on pre-pubertal marriages as well as mandatory intercourse after every monthly period. The reformist interpretation was essentially liberal and humane, and designed to omit the element of coercion.

On the orthodox side, Ram Shastri Apte adduced evidence from 14 'shastras' to prove that "the girl who sees her menses in her father's house (before marriage) is impure, her father is guilty of killing of the embryo 'bhrunahatya' [Gidumal, 1889 78]. As a corollary, the same sin of foeticide was visited upon the husband who failed to consummate marriage immediately after the first monthly period and to have intercourse after every subsequent period, and portions of the sacred texts were also cited to this effect. In the words of Pandit Tarkachuramani of Calcutta: "The 'garbhadhan' rite has to be performed on the first occurrence of that event (i.e., menstruation). This is the first 'sanskara' enjoined upon the Hindoos, and the non observance of this first 'sanskara' renders the performance of all other 'sanskaras' of not much avail" [*Mahratta*, January 25, 1891 6]. Logically this represented the essence of patriarchal thinking since a woman's primary function was procreation, every post menstrual fertile period was to be utilised, starting with the very first such period in a woman's life. Failure to do so meant failure to conceive, which was tantamount to killing a potential foetus.

The reformers' more humane position stressed the distinction between girlhood and womanhood which rested on criteria other

than the mere start of menstruation. But this position had to be made credible and palatable by disguising it in a religious garb and offering counter-evidence from the same 'shastras'. In the words of G S Khaparde, the people were to be persuaded and met on their own ground "If they accept the 'shastras', we accept them too, but interpret them in the light of the knowledge we have acquired", though without distortion [Chintamani, 1901 144]. A systematic effort was launched to restore the 'shastras' to their original accuracy and purity by weeding out later interpolations, and to resolve contradictions on a logical basis. The red thread running through their arguments was, in the words of R Raghunath Rao, that "Infant marriages are not sanctioned by the Hindu 'shastras', nor were they in use in India a few hundred years ago. On the contrary the marriages of undeveloped girls are in a way prohibited by them" [Gidumal, 1889 73]. Ranade wrote a scholarly essay [in Gidumal, 1889 299-314] tracing ancient history and attributing the rigidification of the marriage system to gradual societal decay. During the 'Sutra' period, marriage was a sacrament which presupposed the age of discretion on both sides; choice rather than parental pressure was the norm, a girl could refuse to abide by her father's choice (as in the cases of Savitri, Rukmini, and Subhadra), and royal families allowed their daughters the choice of a mate through 'svayamvara'. The 'Smriti' period introduced a series of constraints and restrictions, reflected in a corresponding reinterpretation of old texts, so that the choice of remaining unmarried came to be denied to women, and pre-pubertal marriages of daughters were made mandatory for fathers and guardians at the risk of damnation. Ranade concluded, on the authority of nearly 30 text writers of repute, that the normal and customary ages for marriage and consummation were 12 and 16 respectively for girls, and 18 and 25 for boys. In order to underscore that the reinstatement of these age limits would neither violate the religious prescriptions, nor disturb existing social mores, he added "Those who seek reform in this matter do not desire to turn marriage into an affair of mutual romantic love. They do not want to thrust aside the parental authority, or to diminish the sense of responsibility now felt. They advocate a return from modern corruptions to the real sense of the old 'Smriti' texts, and their request is therefore fairly entitled to consideration" [Ranade in Gidumal, 1889 314]. Obviously, the reformers were also under a compulsion to re-establish their credentials as practising Hindus and as responsible family men.

Paradoxically, ammunition for the reformers was provided by Manu through his oft-cited verse instructing a girl to wait for three years after puberty, for her father to find a husband for her, or otherwise to choose a suitable husband herself. Similar verses were found in the texts of Baudhayana, Ashvalayana, Sushruta and others to prove

that in ancient times a girl was allowed to remain unmarried for up to three years after attaining puberty, and that when a girl was married before puberty, two later rituals were prescribed. Of these, the 'prajapatya' was a day-time rite to be performed immediately on her attainment of puberty in order to confirm her entry into her husband's 'gotra', and the 'garbhadhan' rite was to be performed at night to mark the beginning of married life. The latter ritual could be deferred for up to three years after the girl's attainment of puberty. Thus the instruction for the husband to have intercourse with his wife after every monthly course was understood to be 'permissive' and not 'mandatory'. These arguments were decisively presented by Bhandarkar during an elaborate discussion of the relative validity of the various texts and their contradictory commands. He concluded that "the consummation of marriage only when the girl has fully developed is quite in keeping with the spirit of the 'rishis' legislators, as the begetting of a son able to do credit to the father is their sole object and its early consummation is entirely opposed to their spirit as the result of it is barrenness or weak and sickly children" [Sudharak, January 26, 1891 3]. The most extreme injunction in this regard was that of Parasara who allowed only a few exceptions (such as the husband's absence, the wife's ill health etc.) to the otherwise rigid rule regarding mandatory intercourse after every monthly period. The reformers claimed that the wife's lack of physical maturity was implicitly included in this list of legitimate exceptions. A long controversy was carried on between Bhandarkar and Tilak on some of these interpretations, Tilak maintaining, *inter alia*, that the 'prajapatya' and the 'garbhadhan' ceremonies were to be performed in immediate succession (i.e. within 24 hours) on the conclusion of the girl's first menstruation.¹⁴

Different authorities past and present, were invoked in the quest for an acceptable interpretation. Mitter insisted that the final authority in Bengal was Raghunandana whose commentary favoured the orthodox faction. The reformers promptly advanced proof that he was in fact in agreement with their own reading of the sacred texts [Indu Prakash, January 26, 1891 3].

Charges of insincerity and hypocrisy were also handed about. The reformers emphasised that both Brihaspati and Baudhayana have prescribed relatively minor rituals, or the expenditure of a very small sum of money to atone for the sin of violating the injunction. The orthodox retorted that the provision of a penalty was no reason to force a practising Hindu to persist in committing a sin. Upon which Indu Prakash [January 26 1891 3] asked "In how many respects do these people, who talk so loudly about religion not break the ordinances of their religion more binding than the present one?"

But perhaps the most significant challenge to the orthodox stance came from the

reformers' examination of the inter-relationship between religion and morality. The Indu Prakash [February, 1891 3] stated the issue bluntly "It is impossible to think that our educated men are so depraved as to consider consummation of marriage before the twelfth year of the wife an absolutely indispensable necessity. That a religion should demand the subjection of a girl of eight, ten, or twelve to the sensual embraces of a man or that it imposes a duty upon a man of carnally knowing his wife at the first occurrence of a certain event, however tender her age, seems to us highly preposterous. [T]hose who affirm such wicked barbarities of our religion are its worst enemies". And again "[I]n the hallowed name of religion they are asking government to countenance a barbarity. Does the Hindu religion, we ask, command the perpetration of this barbarous cruelty on young girls of tender age?" [Indu Prakash, February 16, 1891 3].

CUSTOM AND TRADITION

The orthodox and the reactionists had a second line of defence: they invoked the support of tradition or contemporary custom ('rudhi') as having weightage equal to or even greater than the sacred texts ('shastras') which were amenable to different interpretations. The sanction of current social custom was crucial to their argument because the existence of religious sanctions or even the religious component of a custom was sometimes dubious and the reformers argued that "whether a girl of ten or twelve should or should not be allowed to be treated as wife by the husband" was not a religious but a social question [Indu Prakash, October 27 1890 4].

Opinions regarding the extent of child marriage itself varied in the Bombay presidency. Rao Sahib V N Mandlik denied the existence of "any such general early marriage system prevalent, as can be remedied by government" [Gidumal, 1889 27]. This view was echoed by A Sankariah: "Freedom to marry girls and widows at any age is not denied now, and was not denied at any time, and the agitators are not just and even honest in interfering with those who do not religiously, or socially approve of that freedom" [Gidumal, 1889 1]. Some claimed that the custom prevailed only in the higher castes which formed a small minority while others (as, for example, C Ramchandra Aiyar, sub-judge of Madurai) argued that since the Brahmin minority served as a model for the other castes (especially in restrictive practices regarding women) reform at the top was essential [Gidumal 1889 2]. It was also conceded that the compulsion about pre-pubertal marriage of girls drove many poor fathers (lacking the necessary dowry to secure good matches) to sell their daughters to unsuitable or old men.

Statistical data were marshalled from the 1881 Census and showed that the per cent

tages of married (and widowed) Hindu girls and boys under 10 years were, respectively, as follows: 11 Berar 21.7 and 4, in the Bengal presidency 13.9 and 5.6, in the Bombay presidency 10.5 and 2.5, in the central provinces 8 and 2.6, in the north western provinces 5.4 and 2.4, in the Madras presidency 4.5 and 0.8, and in Punjab 3.5 and 1.1 [Cudumal, 1889 18].

A voluminous debate also centred on the average age at menarche for Indian girls. According to the *Sudharak* [February 16, 1891, reprinted in Agarkar, 1984 425], only 4 per cent of Indian girls reached puberty before the age of 12, so that the proposed bill would affect a very small minority of marriages. Dr S W Kane cited Vagbhat, a great authority in Sanskrit medicine, to the effect that "the period of menstruation in the woman begins with the age of 12 and ends with the age of 50". The logical conclusion, therefore, was that the cases of girls starting menstruation before 12 should be considered abnormal and treated as exceptions [Indu Prakash, March 3, 1891 3].

The prevalence of the custom of immediate post pubertal consummation of marriage was far more difficult to assess. The *Sudharak* challenged the orthodox faction to produce evidence as to whether it was customary to excommunicate or otherwise penalise with a 'pravashchitta' those who failed to consummate marriage within 16 days of the bride's first menses [January 12, 1891, reprinted in Agarkar, 1981 409]. The *Indu Prakash* similarly denied that "there is such an absolutely invariable custom" [February 16, 1891 3].

Particularly sensitive in this connection were the revelations of pre-pubertal consummation of marriage. The orthodox faction tended to deny this occurrence outright, as being sinful according to the 'shastras'. This was emphasised, for example, by Jarkachuramani (regarding Bengal), in his letter to the Statesman of Calcutta [Mahratta, January 25, 1891 6]. However, the *Mahratta* claimed that the introduction of the bill was followed by ample disclosures of the extent of premature cohabitation among the lower socio-economic strata of Bengal. Responsibility was attributed to 'the ignorant mothers in law' who encouraged premature union of the young couples [February 8, 1891 1]. Mitter himself admitted that premature cohabitation was a matter of general practice in Bengal [Indu Prakash, March 16, 1891 3]. Nulkar, in his speech during the final debate on the bill, cited Dr Chevers' *Manual of Medical Jurisprudence for Bengal* (first published in 1856 with several subsequent editions) where he described "the artificial means employed to fit child wives for the earliest possible intercourse with their husbands". Matters were made worse by the use of physical force in such cases. Nulkar also referred to Basu, surgeon major and civil surgeon at Mymensingh, who had recently published a letter in the *Indian Mirror* of Calcutta citing the instance of a nine year old girl who died of

injuries inflicted during cohabitation, and another instance of a girl under 12 who was suffocated to death by her husband to stop her screaming in agony during cohabitation [Indu Prakash, April 13, 1891 4] 11.

In general, however, many of those who advocated late completion of marriage, supported an early marriage ceremony which was to be considered more in the nature of a betrothal. Their reasoning, again, stemmed from the basic patriarchal values: first, that it facilitated the girl bride's adaptation as a devoted wife and an integral part of the husband's household, and secondly, that late marriages would introduce an element of individual choice into what was essentially a family matter. This would be additionally risky because women were, for a variety of reasons, considered to be incapable of making the right choice. The first argument was stated in a mild form by Bhandarkar [Cudumal, 1889 21 2]. He maintained that child marriages were not necessarily ill-assorted, because the parents on both sides ensured compatibility of background, and because the process of growing up as husband and wife reinforced mutual affection and adaptability. The argument was buttressed by C. Subbaraya Aiyar, a judge from Ernakulam: "Early marriages, brought about under the discriminating and fostering care of Hindu parents, have not failed to lead to happy unions, securing to the married couples social and domestic felicity" [Cudumal, 1889 3].

Thus it was felt that a change in the custom of child marriage itself was not a pre-condition for a possible postponement of consummation. According to Tilak, the domestic supervision of elders was sufficient to prevent early contact between the couple. Furthermore, the evils of early consummation could hardly be laid at the door of boy husbands: such atrocities were usually committed by older remarried widowers (the bride being always, by definition, a pre-pubertal girl). It was therefore suggested that an upper age limit for the remarriage of widowers should be fixed at 40 or 45 years [Kesari, September 30, 1890, reprinted in Tilak, 1976 239].

The truth of this argument was conceded also by the reformers and incorporated in one of the resolutions adopted by the fourth social conference (December 1890). It stated that "in the opinion of the conference, the practice of men of more than 40 years of age marrying young girls below 12 is discountenanced by the 'shastras' and is extremely prejudicial to the interests of the community, and that the power of free adoption given by the law leaves no excuse for such ill-assorted marriages, and the conference, therefore, affirms the necessity of actively discouraging all marriages, where the difference of age between the parties exceeds 30 years" [Sudharak, January 12, 1891 2].

Although the focal point of the physiological argument was the physical harm to the girl bride, the reformers also voiced

wider concerns affecting her family, through her resultant barrenness or the birth of weak, sickly children and affecting the society at large which consisted increasingly of a population weak in physique, intellect, and morals, which could therefore be easily kept under subjugation by a foreign colonial power. The implication seemed to be that an investment in the girl-bride's health would yield familial and societal benefits. Both sides marshalled ancient and modern medical authorities to reinforce their arguments.

Injury to Girl Brides

The image of the girl bride as a victim (potential or real), and as an individual entitled to better physical treatment at the hands of her husband, was a new and radical element injected into the debate by the reformers.

The orthodox faction had consistently maintained that the onset of puberty (indicated by menstruation) was a clear sign given by nature that the girl was fit for married life and for motherhood. It was therefore highly improbable, if not impossible, that she would be harmed by cohabitation. Thus an article by 'Medicus' in the *Mahratta* [March 15, 1891 2] claimed that the "commencement of menstruation indicates in all animals the same degree of sexual desire or capacity for intercourse with males of the same kind or race", that there was no proof to show that 'early intercourse [i.e. during the girl's 11th year or later] prevents the further or full development of girls'—and further that the first born infants were generally weaker and more exposed to risk irrespective of whether the mother was a young Indian girl or a full grown European woman.

Some among the orthodox admitted that damage to girls because of early intercourse could not be ruled out, but minimised its extent. Thus Surgeon Major Kirtikar, in a somewhat facetious letter to the *Bombay Gazette*, wrote "Although I object positively to early intercourse I say that in most cases it is neither a matter of 'brutality' nor 'cruelty', but leads to a certain moral and physical deterioration after the lapse of a long time. It is therefore a sheer misuse of terms to compare it with the burning of a woman, or the murder of a child—to all which acts it has been compared. There is hardly a bad custom in existence which does not lead to moral and physical deterioration. Talking of physical deterioration 'tight lacing' has been the ruin of many a young frame. It has sent many a blooming girl to an untimely grave. Is it to be put down by transportation for life?" (emphasis in the original) [Mahratta, February 22, 1891 4].

The reformers cited the ancient medical authority Sushruta: "If a man of less than 25 years begets a child to a woman of less than 16 years, it remains in the womb. If it is born, it does not live long, and if it lives at all, it is weak. Therefore the marriage should not be consummated while the girl

is a child." An almost identical verse from Vagbhat was also quoted [Sudharak, May 18 1891-2]

Corroboration also came from modern medical science. Dr Modendralal Sircar emphasised that "while early maternity results in giving birth to short-lived or unhealthy children, it at the same time seriously compromises the health of the mother also. A host of complaints from which our females suffer life-long, or to which they fall early victims, arise from the evils of early marriage—namely, early pubescence and early maternity" [Gidumal, 1889 246]. The reformers quoted several medical doctors to confirm that early pubescence was undoubtedly induced by early marriage and could not be attributed to India's hot climate as was popularly believed [Gidumal, 1889 246 58].

Western medicine entered the fray most strongly through British medical doctors who favoured reform. Dr Peechy Phipson's talk in Bombay on 'The Physiological Effects of Early Marriage' emphasised the distinction between puberty and nubility. She clarified that although the conventional notion of puberty was based on the first menstruation, the 'true' or 'complete' puberty was reached by a girl only by about her 20th year when the body and mind were fully developed and "when alone a woman attains the capacity for maternity" (completion of marriage at any age earlier than this was therefore harmful [Indu Prakash, October 27, 1890 3]).

Perhaps the most sensational and shocking input into the debate was made by a group of 55 British lady doctors through a disclosure of the brutality to which girl wives were subjected. In an appeal sent to government, they adduced as evidence 13 cases which they had received for medical treatment [Sudharak, November 17, 1890 2 also Indu Prakash, April 13, 1891 4]. With the exception of one older girl, all the others were between seven and 12 years of age, and all were examined within a day or two of the completion of marriage. The common physical injuries included severe haemorrhage, lacerated flesh, crushed pelvic bones, temporary or permanent paralysis of the lower limbs, in the case of a seven year old girl the result was death. One of these girls, 10 years old, was unable to stand or walk, and had crawled to the hospital on her hands and knees. In three of these cases, information was added about their husbands: one was 'about forty years of age, weighing not less than 11 stone', another demanded custody of his wife after one day in hospital 'for his lawful use', and the third 'had two other wives and spoke very fine English'.

Harm to Family and Society

When the area of concern was expanded by the reformers from the girl bride to encompass the family and society as a whole, echoes of Malabari's initial arguments became clearly discernible. Thus Ranade stated that "early marriage leads to early

consummation, and thence to the physical deterioration of the race, that it sits as a heavy weight on our rising generation, enchains their aspiration, denies them the romance and freedom of youth, cools their love of study, checks enterprise, and generally dwarfs their growth, and fills the country with pauperism, bred of over population by weaklings and sickly people, and lastly that it leads in many cases to all the horrors of early widowhood" [Gidumal, 1889 14].

Such was added to the fire by the sanitary commissioner's report of 1890 showing that the deaths of children under five years of age formed 43 per cent of the total number of deaths (in Bombay city). This provoked Indu Prakash to admit that such strong condemnation was well deserved in view of "the evils arising from early marriage, aggravated by our defective system of bringing up children. The painful truth was that "early marriages do result in the physical deterioration of our progeny, and render us thereby unfit for various walks of life, where physical activities no less than intellectual ones are necessary for success" [July 7, 1890 3]. This led to anxiety over the alleged condition of the Hindus who were said to be becoming shorter and physically weaker day by day, so that the father's strength was not visible in the son, and the son's not visible in the grandson, one additional result being that Indian scholars died prematurely [Indu Prakash, October 20 1890 3]. Referring to Peechy Phipson's lecture, the same paper commented "The evils which the doctor portrays as resulting from this pernicious custom, viz, sterility and ill health to the mother, puny and sickly, disfigured and deformed children, and degeneration of the race are too grave to be lightly passed on" [October 27, 1890 3].

An extension of this argument with an explicit reference to genetic inferiority was presented by Dr Smyth of the Madras Medical College in an opening address to his students. His appeal was both to the community and to the government to stop the custom of early marriage which was "homicidal in as much as it leads to sickness and early death and which resulted in "degeneracy of offspring". "Many children are non viable and others are mentally and physically incapable. All originality is suppressed. The imitative faculty alone is preserved". Smyth touched a raw point by saying that "a people born out of early marriage are unfit for self government" and that "a respectable type of the human race" could be produced only through adult marriages. "Consideration of the claim for self government on the part of these is, therefore, deferred for five generations. If in the meantime this community takes responsible steps to raise a proper stamp of human beings by marrying only adult females and that too only after the most careful selection, I shall leave it on record that the then secretary of state do seriously consider the advisability of placing the community on an equal footing with the rest of the inhabitants of

the empire", he concluded [Indu-Prakash, October 27, 1890 3].

The picture of a degenerate and unfit Hindu/Indian society described by Peechy Phipson as 'children of children' and by Smyth as 'infant-born' [Indu-Prakash, October 27, 1890 3], and stigmatised further as undeserving of political power, was one that hit both the social and the political reformers alike.¹⁴ Inevitably in its wake came intense soul-searching and introspection among the reformers. The Sudharak expressed shame because "we turn women into 'mothers' while they are still 'girls'; and as a result they, we, and our children have become weak, sickly, unintelligent, and lacking in strength, courage, energy, and longevity. Also, for hundreds of years we have been the slaves of an alien people who are superior to us in physical strength, and follow their wishes like animals under their control" [November 17, 1890 2*].

THE AGENCY FOR INTRODUCING CHANGE

The awareness of political subjugation and humiliated national pride ran as an undercurrent through the entire debate. Initially even the pro reform fiction was cautious about allowing the government to enter into what was essentially a domestic social matter of the Hindus. The fear that this would prove to be the thin end of the wedge and lead to socio religious subjugation as well was ever present. Thus Bhandarkar admitted "I would not avoid the evil [of child marriage], and secure the good, by a legislative measure" [Gidumal, 1889 22]. Similarly, Khaparde opposed legislation on the grounds that "such reforms should spring from the people, and should not be forced on them, for the appearance of force disinclined people to all reform, and this made matters worse" [cited in Chintamani, 1901 143]. This coincided with Tilak's persistent stand that reform which was imposed upon people through law could not be effective because it could neither ease family pressures upon the young couple, nor help the young couple to control its emotions; only education and knowledge could bring about this change [Aesari editorial, September 2 1890, reprinted in Tilak 1976 235]. These were familiar variations of the eternal debate about change imposed from above and change springing voluntarily from the grassroots.

The orthodox (or more accurately 'reactionist') faction retained its staunch belief in the need for self help and in "the efficacy of the force of moral persuasion and personal character of our preaching reformers and the leaders of our society" which would achieve more and permanent benefits for the society than legislation or coercion could. This was regarded as the only true way to work the movement from within [Maharatta, October 12 1890 2]. The three forces of education, persuasion and example are sufficient to destroy superstition, and to place

society on an improved basis" [*Mahratta*, January 18, 1891: 4].

The same sentiments surfaced later in Sir Thomas Munro's deposition before a committee of the House of Commons: "while sympathising strongly with social reform in India I have not seen any way to approve of the recent governmental interference with domestic life. I consider that given education and political freedom, such changes as the Hindu society needs, would be brought about by the communities themselves. England has as much to learn from India as she has to teach that country ..." [*Mahratta*, September 6, 1891: 3]. Sir Charles Bernard was reported to have "deprecated England's action relative to child marriages in India", believing that a remedy should be "attained by the people themselves, and ... that natives of India should be allowed to work out their own social, commercial and political regeneration" [*Mahratta*, February 14, 1891: 4].

Some Indian enthusiasts of self-help, however, quickly discovered that this was easier said than done. A candid admission of disillusionment came from Daji Bhikaji Khare, a Bombay lawyer who had 'defected' from the anti legislation lobby, that the society was incapable of initiating reform, that the protest against government interference was merely an argument to counter the reformers, and that all reforms introduced thus far had been some form of imposition from the government and not the result of voluntary action. The logical conclusion was that the government's leadership role should also be extended into social matters [*Indu-Prakash*, October, 20, 1890: 3]. Predictably, considerable weight was lent to this argument by official British opinion, including, among others, that of Sir William Hunter [*Mahratta*, October 19, 1890: 1]. Some Indian reformers phrased this differently, insisting that 'reform from within' was "a very sweet and tempting phrase, but without any truth in it" and that a 'stimulant from without' was required to activate the dormant society from within [*Indu-Prakash*, March 3, 1891: 3].

The reformers had marshalled an array of arguments in support of legislation. Firstly, they exposed the selectiveness of the anti-reformers' protest—the latter's vocal opposition to the Consent legislation was ill-matched by their willing and even eager acceptance of government assistance in matters of education, vocational training, municipal reforms, control of alcoholism and of prostitution, etc [*Sudharak*, February 17, 1890: 1; February 20, 1890: 1]. Secondly, they insisted that the bill, far from being coercive itself, would remove coercion currently practised on small boys and girls by their parents and guardians. Thus a law which granted freedom could not be regarded as a law of force and injustice [*Sudharak*, February 10, 1890: 1]. Thirdly, to the anti-reformers' argument that cases of early completion of marriage were too rare to warrant legislation, the reformers replied that cases

of suicide were also rare but constituted a legal offence, and although the practice of 'sati' had disappeared, the law abolishing 'sati' had not been deleted. They further claimed that the Age of Consent Act was perhaps even more acutely needed than the Abolition of the Sutte Act, because the former concerned situations of greater coercion as well as sinful and beastly behaviour [*Indu-Prakash*, July 21, 1890: 2]. Finally, the reformers justified the state's right to interfere in family matters, on the ground that marriage was a social matter on par with other social relations. An assault by a husband on his wife causing hurt was a punishable act whether or not it was done in the performance of his marital function. "The act is not self-relating. It has reference to another individual. Therefore a restraint upon it is not an interference with personal liberty, but protection of another person from harm" [*Indu-Prakash*, January 12, 1891: 4]. The bill was seen as 'a protective measure' and "it is the function of the government to afford protection to any of its subjects who may need protection" [*Indu-Prakash*, January 19, 1891: 3].

This ideological approach, raising wives, and women in general, from a subordinate status to that of equality with all other citizens, and therefore entitled to equal protection, was perhaps the most important contribution to the women's cause.

THE PROCLAMATION ARGUMENT, OR RELIGION vs LAW AND MORALITY

The anti-reform argument which the British government itself was most vulnerable to was the Proclamation argument which challenged the very constitutional legitimacy of the bill. Queen Victoria's Proclamation of 1858 had guaranteed non-interference by the British government in the religious and social affairs of its Indian citizens:

We hold ourselves bound to the natives of our Indian territories by the same obligations of duty which bind us to all our other subjects ... Firmly relying ourselves on the truth of Christianity, and acknowledging with gratitude the solace of religion, we disclaim alike the right and the desire to impose our convictions on any of our subjects. We declare it to be our royal will and pleasure that none be in any wise favoured, none molested or disquieted by reason of their religious faith or observance, but that all shall alike enjoy the equal and impartial protection of the law; and we do strictly charge and enjoin all those who may be in authority under us, that they abstain from all interference with the religious belief or worship of any of our subjects on pain of our highest displeasure [cited in *Indu-Prakash*, January 19, 1891: 3].

As a key document in the debate, the Proclamation also, like the Hindu sacred books, was open to a variety of interpretations. Salient among them were the government's conflicting duties to refrain from religious interference but to provide protection. The government resolved the dilemma in favour

of protection by counterpoising the conflict between religion and morality.

The obvious orthodox charge was that the bill amounted to government interference in Hindu social and religious matters in contravention to its own promises. This charge found support from an unexpected British quarter, though rather late in the day. Frederick Pincott, claimed that the new act would inflict an unjustifiable penalty upon "two hundred millions of innocent people, living lives of purity before God and man, in obedience to the precepts of their religion, the commands of their law-givers, and the immemorial custom of their ancestors"; and that it would sweep away in a few weeks "the whole social fabric of one-sixth of the globe" [*Mahratta*, May 17, 1891: 6].

The reformers also accused the British government, of being too cautious and even cowardly about introducing reform through law, due to the constant awareness of its own alien status and fear of causing disaffection. Otherwise, it would have ended such "marital subjugation" long ago as had been done in the western countries [*Sudharak*, February 10, 1890: 2]. In fact, the reformers went further and, seemingly paradoxically, appealed to the government in the name of Christian principles to protect Indian girls of tender age. *Indu-Prakash* found it "a matter of great regret that a government which calls itself Christian and boasts of its ability to protect human freedom should tolerate such cases and not even provide a law to prevent them" [July 21, 1890 *].

Opinion in Britain was also split along the same lines, except that the British interventionists' argument was tinged with the 'white man's burden' ideology. Among the vocal supporters of the legislation were Cardinal Manning and Mrs Fawcett, both members of Malabari's English Committee. Cardinal Manning claimed that the government could not be accused of religious interference because the customs in question were basically social in nature and not religious. "We are dealing with no matter of conscience but with only a social tradition contrary to the law of nature, which is universal and supreme". He envisioned the British government as charged with a mission in India, and entrusted with the righteous duty to use its unlimited power to stop 'barbarous and injurious practices', such as 'sati', female infanticide, and now, child marriage [*Indu-Prakash*, December 22, 1890: 3]. Mrs Fawcett concurred that such practices had been prohibited by earlier legislation which had forced the 'instinctive conscience' of the western civilisation upon the Indians. This had become inevitable again because "we could not sanction in one part of the Queen's dominions what was treated as murder in another part of them. ... [A] government writes itself incompetent and untrustworthy that leaves the weak to be destroyed by the strong, and the future mothers of the race to be sacrificed physically and mentally to one of the most per-

nicious customs that ever affected a nation" [*Indu-Prakash*, December 22, 1890 3]

Legal experts in India also underscored the government's obligations Telang held that it was "the bounden duty of the legislature" to pass the bill "in the interests of humanity and of the worldly progress of the communities committed to its charge, and for such a purpose as the present, to disregard, if need be, the Hindu 'shastras' The Queen's Proclamation neither can get rid of that duty nor does it even profess to do so The 'shastras' too neither can nor profess to stand in the way of the state's doing the duty" [*Indu Prakash*, February 2, 1891 3] Nulkar interpreted the Proclamation only to mean that the Christian religion should not be imposed upon her majesty's subjects, but that the Indian government remained under "the obligation to secure to all her majesty's subjects in India the enjoyment of equal and impartial protection of the law" [*Indu Prakash*, April 13, 1891 4]

The closest scrutiny of the Proclamation argument came during the deliberations in the viceroy's council Lord Lansdowne justified the bill on the grounds that where religious practices were opposed to individual safety and public peace, and were "condemned by every system of law and morality in the world it is religion and not morality which must give way" and that the non essentials of religion could be sacrificed in the interests of morality as long as "the great fundamental principles of the religion concerned were not disturbed" [*Sudharak* March 23 1891 2 emphasis in the original]

LAW ENFORCEMENT AND LAW SUITS

The perspectives on the Age of Consent Bill were so dichotomous that the orthodox insisted upon it being a new British law causing unwarranted intervention in Indian family matters, while the reformers presented it as a British amendment in the existing British law which had already been imposed on Indian society

The ground had been prepared for this reformist argument by Gidumal in a pamphlet [reprinted in Gidumal 1889 281 8] summarising the provisions of the Indian Penal Code regarding the age of consent and comparing them with those of the English Criminal Law According to the Penal Code the offence of rape was committed only when a husband had intercourse with his wife who was under 10 years of age with or without her consent and the offence was punishable with transportation for life according to Section 376 No offence was committed if the wife was 10 years old irrespective of consent (Section 375) A person other than the husband, having intercourse with a girl who was 10 years old with her consent, was not punishable Finally a girl under 12 years of age was not competent to consent to the commission of any offence upon her or in respect of her except that of rape or seduction (Section 90 and 375) According to English law, intercourse with a

girl under 13, with or without her consent, was punishable with penal servitude for life, and intercourse with a girl over 13 and under 16 with or without her consent, was punishable with 10 years' rigorous imprisonment Gidumal called this 'a crying inequality'

The *Mahratta* promptly retorted by saying that Section 90 of the Indian Penal Code may treat a girl under 12 as incapable of giving consent but marriage considerably affects the relations between the parties and alters the moral standpoint altogether, so that the question of rape does not arise Also, a comparison of Indian and British laws was meaningless because the law can not be identical in two countries which differ so much in their physical and moral conditions and because the legal age limit at marriage for girls in Britain was 12 [February 3 1889 12]

The validity of the concept of 'consent within marriage' was a crucial issue The *Mahratta* [March 17 1889 4] cited a case which was decided in November 1888 by the Queen's Bench division of the high court in Britain where Judge Pollock had observed that sexual communication between married persons is 'by virtue of an irrevocable privilege conferred once for all on the husband at the time of the marriage and not at all by virtue of consent given upon each act of communication as is the case between unmarried persons' The paper went on to add that according to the law in Britain

Consent or no consent a husband has a right to the person of his wife and he can be convicted if at all of hurt or grievous hurt It pointed out that the Indian Penal Code was framed on the model of English law with just sufficient alteration to suit Indian society by setting 10 years as the minimum age limit for cohabitation in view of the prevalence of child marriage

A challenge to the husband's total rights over his wife was perceived by the orthodox as a loss of individual (male) freedom Thus according to Kirtikar the new bill amounted to a loss of personal freedom it means the annihilation of the British liberty which I consider is the glory of the British rule [*Mahratta* February 22 1891 4] The *Mahratta* followed this line of thought further The Brahmins we know are fighting for freedom and any measure that places restrictions upon the liberties of anybody cannot be acceptable to them In trying to remove the alleged inequalities the amended bill creates new ones [March 15 1891 2] The reformers disposed of these and similar objections by asking 'What hardship does a husband suffer if he is asked to put his marital rights in abeyance until the subject of his rights becomes physically fit for the enforcement?' [*Indu Prakash* February 16 1891 3]

Another objection was that the bill placed husbands and seducers in the same category The *Mahratta* [February 1 1891 7] cited R Ghosh's letter to the *Statesman* of Calcutta in which he claimed that since there were

rarely any cases of seduction in India, the legislation was "gratuitous and superfluous", while the section applicable to husbands was "obtrusive in the highest degree Then, we are utterly at a loss to understand from what standpoint—national, moral or legal—the lustful seducers of a guileless and yielding virgin, and the passionate husband of a loving wife are to be placed under the same category and alike to be branded as a criminal of the blackest dye"

In sum, this faction was convinced that the bill had created a new offence The *Hindu Patriot* of Calcutta claimed that "The fact is, the marriage sacrament is not complete, unless what is known as the conceptual ceremony is performed The bill, therefore strikes at the very root of the Hindu marriage law by limiting the age of consent to twelve" [*Mahratta*, January 18, 1891 5]

The salient orthodox objections were presented by Mitter during the debate in the legislative council [*Mahratta*, January 18, 1891 6 7] (1) The existing law was adequate for protecting girl brides (2) Puberty was a far more reliable criterion of physical maturity than a numerical age limit (3) The husband whose wife reached puberty before the age of 12 was faced with the dilemma as to whether to go to prison (for breaking the British law) or to go to hell (for violating Hindu sacred law) (4) If the husband was sentenced for breaking the British law and sent to prison or transported for life, it would lead to the almost civil death of a Hindu wife Thus "there is the hardship of the law punishing the wife for the guilt of her husband (5) The law would enable the police to terrorise the people (6) Hostile relatives or neighbours would exploit the law and lodge false complaints

The reformers on their side, presented an entirely new perspective that the marriage ceremony was not an unproblematic observance of sacred laws or age old customs into which British law was interfering On the contrary marriage often led to incidents which called for legal protection because harm unjust harm most fatal harm is occasionally done to Hindu child wives by their husbands prematurely claiming to exercise so called marital rights upon their persons [*Indu Prakash* January 18 1891 3]

At the third social conference (Bombay, 1889) the first resolution centred primarily around the discrepancy in the Penal Code regarding the age limit at which a girl may properly be treated as an adult woman In the Penal Code itself the general age of consent was laid down at 12 (Section 90) the same was true in the case of assault (Section 350) while in the case of certain offences it was as high as 14 or 16 (Sections 361 and 373) Pointing to these contradictions Ranade argued 'I take my stand on the Penal Code of the country, and on the gravity or otherwise of the several classes of offences and on this basis I contend that if the consent of a girl does not avail a man

who assaults her or robs her or cheats her or kidnaps her, if she is below 12 in some cases, and below 14 or 16 years in age in other cases, *pari passu*, it should not equally avail a stranger, or even a husband, when the offence is rape, and the girl is less than 12 years old" [Ranade, 1915 93 4]. He concluded by saying that the reformers did not go out of their way to seek the help of the law, but sought to amend the law which had already interfered detrimentally, and "to establish a desirable harmony between the law and our most approved practice" [Ranade, 1915 95]. In fact, Ranade and other reformers conceded that 12 (the general age of consent in the Penal Code) was considered to be too low a limit outside the Hindu community and even within it, but left the question to the legislative authorities.

Sir Andrew Scoble, in introducing the Age of Consent Bill which was to raise the protected age for married as well as unmarried girls, hastened to state at the outset that the bill created no new offence. He also discussed the argument that the nature of the marital relations rendered it impossible for a man to commit a rape upon his own wife, because the carnal knowledge of the wife could not be unlawful in view of the matrimonial consent which she had given. He stressed that marital intercourse may in fact, be unlawful under certain circumstances, and the Penal Code had therefore made provisions because "the check of the law may be necessary to restrain men from taking advantage of their marital right prematurely." He further maintained that the state had an unquestionable right and duty to interfere, "for the protection of any class of subjects, where a proved necessity exists for such interference" and stated that against this background the object of the bill was two fold: to protect female children from immature prostitution and from premature cohabitation [Maharatta January 18, 1891 5 6].

Ultimately, the bill was enacted in March 1891 and represented the first step towards protecting girl brides from physical assault. The complementary measure to protect girls from becoming girl brides had to wait another four decades when the minimum age at marriage for girls and boys was fixed at 14 and 18, respectively by the Child Marriage Restraint Act (or Sarda Act) of 1929 which came into effect in 1930 [Rathbone, 1934 43].

The enforcement of the Consent Act was another thorny issue. Firstly it was argued that it was difficult to ascertain a girl's age given the faulty system of registration of births and the fact that not all parents maintained their children's horoscopes. Secondly a physical examination of girls by medical doctors was considered distasteful. Thirdly a wife (at any age) was highly unlikely to lodge a complaint or testify against her husband. Fourthly a nightmarish scenario was painted in which the police had the powers to invade the bedroom. Finally it was claimed that hostile relatives or neighbours could

use this chance to make false allegations to settle personal scores. The last two objections were disposed of by the reformers by stressing the possibility of enacting certain provisions, such as making the offence non cognisable, and permitting bail in cases where the offence did not result in serious crimes [Ranade, 1915 102].

The two most highly publicised law suits pertaining to the early completion of marriage occurred in Bengal. The first of these was the 'Calcutta child-wife murder case' of 1889 (prior to the Consent Act), mentioned above. The consistent tendency of the orthodox faction (and of the judiciary) was to exonerate the husband concerned. Thus the *Mahratta*, in its first report of the case, claimed that "It is ignorance that has much more to answer for in such cases than any violent desire to assert conjugal rights" [July 6, 1890 1]. The paper went further and insisted that a "poor innocent child has been literally murdered by her husband" only because her foolish parents "blindly yoked their tender girl to a man of thirty years. The sin of her death will lie on their heads no doubt but it will also lie on the society which sanctions such cruel sacrifice" [July 6, 1890 4]. Everybody except the 'murderer husband' himself seemed to be the culprit.

The husband was ultimately sentenced to only one year's rigorous imprisonment for 'causing grievous hurt by a rash and negligent act' (which, according to the *Mahratta*, proved the adequacy of the existing legal provisions). Admitting that the punishment was lenient, the paper cited the judge's reasoning: "However, it has to be borne in mind that the husband had no intention of hurting his wife. He thought and rightly so that he was entitled to make use of his wife for the gratification of his passion. He belonged to a low class of society and had not the fine sensibilities as well as the chivalrous instincts which generally save better men from such deeds in spite of temptations" [August 3, 1890 4]. The judge further explained that the husband was sentenced for causing grievous hurt, because under the existing law, the husband was not guilty of rape as the wife was over 10 years of age [Maharatta August 10, 1890 2].

In the second well publicised case of June 1891, also in Calcutta, 'the first victim' of the Age of Consent Act was a Muslim man of about 20 charged with having caused the death of his wife, about 10 years old. The husband contrived to be alone in the house with his wife one night assaulted her, and was horrified to see her bruised and disfigured body. In a state of panic, he hanged her from the ceiling in order to stage a suicide. The coroner's jury held that he had injured her and hanged her but at the same time added the rider that he was at that time so inflamed by passion as to be unable to understand that death would probably result from hanging. In the sessions court, the jury found the husband not guilty of murder. The judge disagreed and sent the case to the high court. Here some members

of the court held that the husband was at that time in such a mental state that he might not have realised what he was doing. Out of deference to this opinion, the sentence was reduced to transportation for life [Maharatta, June 14 1891 2].

At the same time, the orthodox faction continued to reiterate the fear of the new act being abused. This fear was realised, according to the *Mahratta*, in the first case filed in Pune under the act in November 1891. It was suspected to be a false allegation by the wife's relatives, motivated by monetary considerations, and the husband concerned was sent to jail allegedly on insufficient evidence [November 8, 1891 3, November 15, 1891 4]. A crop of similar cases continued to be reported in Bengal and elsewhere.

IV

Political Repercussions

In the socio political climate of the closing decade of the 19th century, one sure way of marginalising women's issues was to politicise them. The debate over the relative priority and the guiding principles of social or political reform was already raging, especially between Telang and Tilak in the Bombay Presidency. The opponents of reform appealed to patriotic sentiments for mobilising resistance on grounds of foreign interference in religion, while the reformers delinked the two issues and advised their 'educated countrymen' not to be swayed by such misleading appeals. 'Let no thoughts of pseudo patriotism weigh upon their minds, and induce them to appear to believe a creed which from conviction they have discarded' [Indu Prakash, February 2, 1891 3].

While the equation of political reform with social orthodoxy was in the process of being established, the anti reformers' Proclamation argument was also a thinly veiled threat that government interference—which, moreover, involved a breach of royal promise—would not be passively tolerated. This potentially rebellious threat was buttressed by open allegations that the government itself was, directly or indirectly encouraging its Indian officials to demand the Age of Consent legislation so as to legitimise its own intervention. The *Hindu Patriot* claimed that Telang in Bombay and Satyendranath Tagore in Calcutta had been allowed to take part in the support agitation with impunity, while the 'pandits' of the Calcutta Sanskrit College had been prohibited from joining the protest agitation, and the *Amrit Bazar Patrika* of Calcutta and the *Mahratta* of Pune also echoed the charge of collusion, which was vehemently denied with evidence by the reformers [Indu Prakash, March 30, 1891 3].

The fear that the new legislation would have unforeseen political repercussions was shared also by British opinion in India and in Britain. Pincott's paper opposing reform was favourably received by several news

papers in Britain, and the *Evening News and Post* (April 19, 1891) warned that the "most serious blow to be struck at our rule in the East in the near future" will probably be delivered "by the hands of Englishmen acting under the stimulus of a fraudulently manufactured public opinion. [T]he passage of the Act would be a crime and a blunder of the first magnitude and would give a sharper blow to the stability of our Indian Empire than can be dealt by a dozen small wars" and a hundred petty uprisings [*Mahratta*, July 26, 1891 8].

However, there were clear limits to gestures of rebellion, sedition being a serious offence. At the fifth social conference (held at Nagpur in December 1891), G S Khaparde admitted in his presidential address that he had opposed the bill on the grounds that social reform should originate within the society and not be imposed from without, but also insisted that "now that the bill is law, it is wrong to fight against it. To throw dirt at it now is, in my opinion, little short of—from one point of view—sedition" [Chintamani, 1901 143].

In fact, a few months earlier the Bengal paper the *Bangabasi* had been prosecuted for criticising the Age of Consent Act in articles published in its issues of March 28, May 16 and June 6. According to the report in the *Mahratta* [August 16, 1891 3 5], one of the offending paragraphs in translation as read in court said: "If the English ruler wishes, he can deprive us of our property, insult our families, give them trouble and can obstruct us in the exercise of our religion, usages and observances. The English viceroy, governor general Lansdowne Bahadur, the other day, in the legislative council in outspoken voice loudly with swelling bosom proclaimed this very matter." Other articles were entitled 'The Revealed Form of the English Ruler' and 'An Outspoken Policy Is the Best for Uncivilised Person'. This report in the *Mahratta* itself was an exercise in tight rope walking. Its criticism of the government action as 'unwise and ill advised' was balanced by its commendation for 'the liberal minded and high souled statesman at the head of Government, brought up in the glorious tradition of a free and outspoken press at home'. At the same time, the paper carefully stressed the generally known and intensely bitter anti act reaction in Bengal, and the belief of its people that "the act would interfere with the sacredness of marital relations on which the whole fabric of Indian society" or that of any other society rests [August 16, 1891 4].

On the one hand, the anti reformers claimed that the government had introduced the act under pressure from the British pro reform opinion which had been misled by Indian reformers, and wanted social issues to be kept in abeyance while promoting political reform. On the other hand, the Indian reformers expressed an equal and opposite reaction, making political reform contingent upon social reform. A O Hume, the 'father of the Congress', declared that

he assumed that the large majority of the Congress party supported the bill, "were it otherwise, he would wash his hands off the Congress", and advised the opponents to desist from such discreditable conduct [*Indu Prakash*, February 2, 1891 4]. Prof Selby issued a warning that the protest against the bill by educated people was suicidal and would have adverse political consequences, while according to Rev Evans, "this Age of Consent Bill opposition by so many of the educated people of Bengal will hurl back the Congress movement a century" [*Indu Prakash*, February 16, 1891 3].

While the day was won by the social reformers who rejoiced in the passage of the Age of Consent Act in 1891, the days and years to come were claimed by the champions of political reform who succeeded in stalling further social change. The Consent Act ensured legal protection for girl brides, and the related controversy introduced a more humane perspective on their condition but its fall out was that the cause of women's emancipation was relegated to the background over the next few decades.

Notes

[This article is an off shoot of the research done for a paper presented at the Fourth International Conference on Maharashtra Culture and Society on the theme 'Images of Women and the Feminine in Maharashtra' held at Arizona State University on April 6 8 1991. While the conference paper focused on the perspectives on women and was confined to the Maharashtra region (see Kosambi 1991 in the references below) the present article has a wider scope. It aims at a cross regional coverage of the interrelated social religious legal and political issues.]

- 1 The bill was applicable also to unmarried girls but the controversy disregarded them and concentrated only on married girls. Hence the focus of this essay on girl brides.
- 2 The proposed bill impacted upon the Hindus most strongly although it was to apply to all other religious communities also, many of which had adopted the Hindu practice of early marriage. We have therefore concentrated on the Hindu controversy only.
- 3 What is reviewed here is not the debate regarding child marriage *per se*, but only that portion of it which was intertwined with the question of early consummation of marriage. It may be mentioned at this juncture that predictably strict adherence to these practices on religious grounds was confined mainly to the upper castes.
- 4 For a detailed discussion of the ancient Hindu texts and the nature of Hindu patriarchy, see Mies [1980].
- 5 This concurred with the British view that the wife's consent was implicit in a marriage. The point of divergence between the two perspectives was the fixing of an appropriate minimum age limit for cohabitation and for marriage itself.
- 6 A more elaborate treatment of this aspect in the context of Maharashtra is given in Kosambi [198b].
- 7 By Maharashtra is meant the Marathi

speaking region which was then fragmented into parts of the Bombay presidency, the central provinces and Berar, and the Hyderabad state. The chief reason for concentrating on Maharashtra is the author's familiarity with leadership and the *Sudharak* and the *Indu Prakash* which were socially progressive and politically liberal, associated respectively with Agarkar and Ranade. However all these papers published frequent reports of events in other parts of the country and also cited extracts from other papers either in English original or in translation.

- 8 The Parsis were the descendants of Persian refugees who had settled in Gujarat from the 8th century onward and adopted many local customs while retaining their Zoroastrian religion. They flourished as a successful and progressive community especially from the 17th century onward under British patronage, and migrated in great numbers to Bombay city.
- 9 In the words of the *Mahratta*, the appeal was 'a missile from the Malabar camp, and Mr Ranade is credited to be its author' [October 5 1890 6]. Women themselves remained, by and large, invisible in this entire controversy as they did in debating other measures designed for their emancipation. This aspect has been given attention in Kosambi [1988 and 1991].
- 10 Tilak had presented an advanced reform programme before the Tursabag meeting, but reversed his stand during the meeting. Later, at an informal meeting with the reformers, he recapitulated his position again. Reporting this, the *Indu Prakash* commented: "He is an earnest sincere man, whatever may be said of his consistency" [November 17 1890 4]. Similarly *Indu Prakash* mourned the change in Madhav Rao that "It is not possible to reconcile Sir Madhavrao's present pronouncements with the views he expressed a few years ago except on the grounds of loss of intellectual power" due to 'advancing age' [December 15, 1890 3]. Their paths, however, were to diverge permanently soon thereafter.
- 11 All quotations marked with an asterisk are translated by the present author from the Marathi original.
- 12 This particular debate acquired acrimonious overtones. Bhandarkar, in his final reply to Tilak, commented: "I have been carrying on literary controversies since 1864 but never did I hitherto meet with an opponent who treated me with such studied discourtesy as Mr Tilak has been doing" [*Sudharak*, February 23, 1891 2].
- 13 The general tendency of the Marathi and Anglo Marathi press was to dissociate Maharashtra from this practice which was believed to prevail largely, if not exclusively in Bengal. However, a case had been reported two years earlier in Bombay, involving a 47 year old man charged with assaulting his seven or eight years old wife who made an unsuccessful attempt at suicide. Both were brought before the magistrate who declared his incapacity to protect the child. It was further revealed in court that the girl's father had agreed to this marriage on the promise of receiving a monthly sum of Rs. 20 from the man. The *Indu Prakash* [April 29, 1889 3] published

a public appeal by R Raghunath Rao of Madras, based on this incident, and also wrote a Marathi editorial entitled 'The Slave Trade in India' [May 6, 1889]

- 14 By political reformers are meant those who gave political reform priority over social reform. Tilak who belonged to this category, however, insisted that it was demonstrably not the feeble condition of the Hindus but their divisiveness which facilitated British political expansion [Aesari, February 9, 1892, reprinted in Tilak, 1976: 250]

New Industrial Policy

Questions of Efficient Growth and Social Objectives

J C Sandesara

India's industrial policy and planning have had a mix of economic and social objectives. The economic objective is growth and the social objectives have been located in the sphere of encouragement of small industry, promotion of regional balance, prevention of concentration, etc. What is there in the New Industrial Policy Statement to further these social objectives? Arising out of the response to this question is a supplementary question. How otherwise are the social objectives proposed to be promoted?

THE New Industrial Policy (NIP) was tabled in parliament on July 24, 1991. The NIP purports to raise industrial efficiency to the international level and, mainly through it, accelerate industrial growth. What are the sources of increase in efficiency and production, as could be gleaned from the NIP? This question is answered in Section II.

India's industrial policy and planning has a mix of economic and social objectives. The economic objective is growth and social objectives are in the spheres of small industry, regional balance, concentration, etc. What is there for the latter in the NIP? Arising out of our response to this question is a supplementary question. How otherwise will social objective be promoted? Discussion of two questions is attempted in Section III.

Before, however, we take up these questions, a brief account of the main points of the NIP is in order and is presented in the following section.

I

New Industrial Policy

The NIP relates to industrial licensing policy, foreign investment, foreign technology agreements, public sector policy and Monopolies and Restrictive Trade Practices (MRTP) Act. Since the NIP is very recent and is widely publicised as also because of limited space, we take it that the reader is familiar with the basic objectives of these policies, and the considerations which have necessitated changes in the existing provisions in these areas. So this ground is not covered here. However, in order to enable the reader to appreciate fully our response to these questions, we present here, somewhat tersely, the main features of the NIP.

Industrial licensing is abolished for all projects except for a limited number of industries related to security and strategic concerns, social reasons, hazardous chemicals, environmental reasons and luxury consumption goods. The number of such industries is eighteen.¹ The licensing provisions would not apply to small scale units manufacturing any of the above items reserved for exclusive production in small scale sector.

In projects where imported capital goods are required, automatic clearance will be given in cases where foreign exchange availability is ensured through foreign equity and if value (CIF) of imported capital goods is less than 25 per cent of total value of plant

and equipment subject to a ceiling of Rs 2 crore.

In locations other than cities of more than 1 million population, there will be no requirement of obtaining industrial approvals from the central government except for the industries subject to compulsory licensing. In respect of bigger cities (of more than 1 million) non polluting industries like electronics, printing etc. will be permitted to be located outside 25 kms of the peripherals.

The mandatory convertibility clause will not be applicable for term loans from the financial institutions for new projects.

Broad banding will be permitted to the existing units if it is done without additional investment. Similarly the exemption from licensing will apply to all substantial expansion of existing units.

Approval will be given of direct foreign investment up to 51 per cent foreign equity in high priority industries without any bottleneck. Such finance will be given if foreign equity cover the foreign exchange requirement for imported capital goods. The number of such priority industries is 34. Other foreign equity proposals including proposals involving 51 per cent foreign equity which do not meet this criteria will however require prior clearance. Foreign equity proposals need not necessarily be accompanied by foreign technology agreement.

To provide access to international markets, majority foreign equity holding, up to 51 per cent will be allowed for trading companies primarily in a few exports.

A special empowered board will be constituted to negotiate with a number of large international firms and approve direct foreign investment in select areas.

Automatic permission will be given for foreign technology agreements in the high priority 34 industries referred to above, up to a lump sum payment of Rs 1 crore, 5 per cent royalty on domestic sales and 8 per cent for exports subject to total payments of 8 per cent of sales (over a 10 year period from the date of agreement or seven years from commencement of production). For other industries, automatic permission will be given if no free foreign exchange is required for any payments.

For hiring foreign technicians and for foreign testing of indigenously developed technologies, no permission will be necessary.

The number of industries reserved for public sector is eight.² There is no bar in opening these areas for the private sector.

Government will review the existing portfolio of public investment. Although the industries for this review are not identified by product, the characteristics are specified. They include industries based on low technology, small scale and non strategic areas, inefficient and unproductive areas, areas with low or nil social considerations and areas when private sector is sufficiently developed. Although it is not specified, enterprises from such industries may well be subject to closures, liquidation, rehabilitation or full part privatisation or ownership/management.

Attempts will be made to make the public sector that will then remain more efficient in various ways. There will be greater commitment of the government to make public sector enterprises in the reserve category more growth oriented and dynamic (relative to other public sector enterprises). The sick enterprises will be referred to the Board of Industrial and Financial Reconstruction (BIFR) or some such body to be thought of for formulation of rehabilitation/revival package with due regard to the interests of workers. A part of the government's shareholding will be divested in favour of mutual funds, financial institutions, workers and general public. The boards of public sector enterprises would be made more professional and given greater autonomy. There will be greater thrust on performance improvement through Memoranda of Understanding (MOU) system and to facilitate a fuller monitoring MOUs will be tabled in parliament.

The MRTP act will be amended to remove the threshold limits of assets in respect of MRTP companies and dominant undertakings. This eliminates the requirement of prior approval of the central government for expansion, establishment of new undertaking, merger etc. and for appointment of certain directors. The provisions regarding restrictions on acquisition and transfer of shares will be incorporated in the companies act.

Emphasis will now be placed on controlling and regulating monopolistic, restrictive and unfair trade practices. For this the MRTP act will be suitably amended and the MRTP commission's powers increased.

II Efficiency and Growth

The changes outlined above purport to raise efficiency and accelerate production of industry. What are the sources for the same?

These changes seek to serve this objective in five different ways. First, a number of changes in industrial licensing policy, foreign investment, foreign technology agreements and MRTP act are such as do away with the prior clearance of the government. In such cases, project time and, therefore, project cost will be reduced. This will free the material and human resources for more productive uses than for cultivating contacts with persons with power and influence to get such clearances. Thus, the input cost per unit of output in the proposals which are freed from prior clearance requirements will go down and thus efficiency will be increased.

Second, the changes in respect of foreign investment and foreign technology agreements are also designed to attract capital technology, and marketing and managerial expertise from abroad. This will lead to additions of scarce resources in the Indian economy. Inasmuch as these resources are also more efficient industrial production will increase both through higher productivity of these resources as well as through their additionality.

Third, some changes such as regards public sector may increase the allocative efficiency. Consider for example the proposal to reduce the number of industries reserved for public sector to eight from 17 listed in Schedule A of the Industrial Policy Resolution, 1956 (IPR). The opening of the nine industries for the private sector is in a way an opening for the sector which has given, by and large, a better account of itself. Closures/liquidations or rehabilitation of the sick/weak public sector enterprises that may follow from the recommendations of the BIFR or some such other body to be thought of, would also free the resources for the other, more productive uses. Similarly, privatisation may make for improved efficiency of the public sector, through it being subjected to the stock market discipline.

Fourth, other measures in this area such as purposeful formulation and implementation of MOU and its monitoring, professionalisation and greater autonomy may be expected to improve the performance of the enterprises that will remain in the public sector.

Fifth, greater emphasis on controlling and regulating monopolistic, restrictive and unfair trade practices and the strengthening of the powers of the MRTP commission will curb anti-competitive behaviour of firms in the monopolistic, oligopolistic and ineffectively competitive markets and thus promote competition and through it efficiency.

The question of efficiency and growth may be examined further by referring to two cases—one very recent and the other a bit distant.

The 1991-92 budget of the government of India has proposed reduction in depreciation allowance permissible to the corporate sector from 33% to 25 per cent and an increase in corporate tax from 40 to 45 per cent. It also raised excise duties on a large number of industrial products. And yet, the stock markets have been booming since then. An explanation suggested here is that the bearish tendency of the budget was counter-voiled by the liberalisation policies and procedures of the NIP which also was announced on the day of the budget, yielding to a boom in stock markets.

The second reference relates to the industrial growth experience of the period since the late 1970s which has witnessed a high rate of growth of industrial production of 8 per cent per annum in a sustained way. This period also witnessed a large number of liberalising changes in policies and procedures affecting industry. Thus, for example, the industrial policy of 1973 identified high priority areas where investments from large industrial houses and foreign companies were permitted. The industrial policy of 1980 emphasised the need of promoting competition in domestic market, technological upgradation, exports and foreign investment in high technology areas. In 1985 and 1986, to subserve these and related objectives a number of policy and procedural changes were introduced. Finally, in 1990 the government announced further liberalisation in respect of licensing and foreign investment and in the definition of small industry.

This period also witnessed liberalisation of policies and procedures in other areas as well—trade, finance, fiscal policy etc. Also the share of private investment relative to public investment has increased in our five-year plans.¹

Although these changes of policies and procedures cannot be quantitatively related to the high rate of industrial growth of this period, they surely seem to have played a major role in contributing to that growth. The explanations offered by two perceptive analysts of the growth experience of this period include importantly the liberalisation policies pursued during this period.

Thus, the logic of the NIP, the response of stock markets to it and the experience of liberalisation—all lead us to believe that the NIP along with liberalisations in other areas paved the way for increased efficiency and higher rates of growth in a sustained way, of the order of say, 10 per cent per annum during the medium term. However, in the very short run, as the economic agents will be busy making adjustments to these changes, growth may slow down.

A final point before we turn to the second question in the following section. Change is immanent in growth and development, and it is facilitated if economic agents directly responsible for promoting growth and efficiency have the required flexibility to deal with the emerging challenges and opportunities. While recent liberalisations have

made for considerable flexibility in a number of areas, flexibility in the field of employment and industrial relations, especially in the organised sector of secondary and tertiary activity, hardly exists or exists minimally. If we wish to capitalise further on the gains from flexibility emerging from other areas, some serious thought needs to be given to this area.

Of late, employment growth has slackened. The NIP makes many jobs in government departments/corporations redundant.⁶ This may also happen in industry, and that many workers may not be needed in the same old jobs. These workers cannot be left uncared for.

One way is to provide reasonable compensation to the workers who have lost or are prone to lose their jobs. The other, though not the alternative, way is to rehabilitate such workers by placing them in new jobs in the enterprise industries and locations that are growing. So a programme of rehabilitation for such workers—through transmission of information on expanding activities, retraining them for the new skills that may be required in the expanding enterprises and industries and giving them hardship allowances for moving to new areas—is needed. This programme may be funded by industry workers trade unions, and central/state governments, and may be administered and monitored by a board with membership drawn among others, from the funding agencies. In this connection, the recent experience of some European countries which have had rehabilitation experience of workers who had lost or were prone to lose their jobs in declining industries may be carefully analysed and appropriate lessons drawn for formulating our policies.

III Social Objectives

We now look at the social objectives of industrial policy and planning enunciated in the IPR and the five-year plans in the context of the NIP.

Included in these objectives are greater emphasis on public sector relative to private sector and faster expansion of basic and key good industries than of other industries, prevention of concentration of economic power in private hands, regional balance and promotion of small industry.

It must be confessed that there is precious little in the NIP to subserve these objectives. In fact, in the short run, the NIP will go counter to these objectives. Thus, for example, the reduction in the number of industries reserved for the public sector, and closures/liquidations and proposed privatisation of some public sector enterprises reduce the area of public sector. Moreover, to the extent that the public sector is mostly in the basic and key industries, the lessened importance of the public sector will also slow down the growth of basic and key goods industries.

The amendment of the MRTP act to remove the threshold limits of assets in

respect of MRTP companies runs counter to the objective of prevention of concentration of economic power in private hands.

Also, liberalisation of licensing policies and procedures in regard to the location of projects reinforces the attraction of the already developed regions, and thus goes against the regional balance objective.

Finally, the NIP package unleashes a strong dose of competitive forces as regards licensing, foreign investment, foreign technology agreements, public sector and the MRTP act. All these cannot but affect the existing, mostly less advantageously placed, small scale sector adversely. However, it needs to be added that the NIP has promised that a package for the small and tiny sectors of the industry will be announced shortly. A final view on this sector must therefore be deferred till then.

The short answer to our second question, namely, what is there in the NIPP for social objectives, is, to put it no more strongly, by and large, little.

Arising out of this response is a supplementary question: How otherwise will social objectives be promoted in future? We answer this question leisurely referring to the developments in industrial policy and performance on economic and social objectives since the early days of planning.

It needs to be stated at the outset that our objectives are varied and mutually conflicting, and *inter se* priorities are not specified. One implication of this is that anything can always be defended or justified in terms of one or the other objective. Thus, for example, the location of a large plant in an industrially backward area by a very large private company can be commended on the basis of the objective of reducing disparities in the distribution of industrial activity but can be criticised on the ground of accentuating concentration of economic power in private hands or also on the ground of slackening industrial growth (in view of pre-emption of some resources for investment in infrastructure in the backward area when bereft of it, instead of investing them fully in manufacturing).

It will perhaps not be seriously disputed that on paper while all objectives have received equal emphasis throughout the last 40 years, in practice it is the economic objective of rapid industrial growth (coupled with special emphasis on basic and heavy industries and on their production in public sector, the latter two until recently) which has been pursued more vigorously than other objectives. The implication of this position is that in case of conflict among these objectives, the question of priority has been settled in favour of these objectives. This seems to be specially true for a large part of the planning period except for a brief interlude of four or five years beginning 1969. So at the government level, the objective of rapid industrial growth can be said to have reigned supreme and other objectives to have got low priority. This point is argued in detail elsewhere,⁷ by referring to

the allocation of outlays in plans and to the adoption of various legislative and other measures to promote these objectives and will, therefore, not bear repetition here.

The last 40 years have seen a rate of industrial growth of about 6 per cent per annum. And the performance on other social, low priority objectives during this period has, in general, been in the directions expected of the objectives. Industrial production has been greatly diversified, sector wise and industry wise; modern small industry has emerged as a major sector to reckon with; inter-state disparities as also intra-state disparities in industrially developed states, have narrowed and concentration of economic power in private hands has declined. There is no doubt that the specific policies and measures on behalf of the social objectives have played a role in producing these results. But the more significant role may have been played by high growth itself through its percolation effects. If this interpretation is accepted, the role of industrial growth as a propeller of social objectives comes in its own right.⁸

The message of the above discussion is that inasmuch as the NIP is growth promoting mainly through improvement in efficiency of industrial production, even as it contains little to promote social objectives it may be expected eventually to subserve almost all of the social objectives as well (as the preceding growth promoting policies and measures have done) except in regard to the objective of better expansion of the public sector relative to the private sector.

IV

Conclusion

Finally, the conclusions and some speculation.

It is well known that there is a time-lap between change of policy and its percolation in production. Policies have to be followed by measures and both have to be appreciated in the right spirit and followed up by investment decisions, investments and production by the economic agents to seize the opportunities thrown up by the changes. In view of this during this period of adjustment say of one or two years production may not only not respond positively to the NIP but it may even slow down. But after that period on the topic of the NIP elaborated and in the experience of previous liberalising policies outlined, in this paper industrial growth may be expected to accelerate in a sustained manner outpacing the figure of 8 per cent of the 1980s. And this growth along with policies to promote social objectives will also reinforce the tendencies of improved performance on almost all of the objectives except in the sphere of public sector.

The speculation relates to the role and response of government at the centre and the prime ministers to the economic policy changes especially during the last decade and a half. During this period the economic

policies and procedures have been increasingly liberalised, and simplified, and the country has been governed at the centre by different political parties, and the governments of these parties have been headed by a number of prime ministers. This period witnessed the Congress(I) Party government thrice, and the Janata Party, the National Front and the Samajwadi Party governments once each, and these governments have been headed by seven prime ministers. Which perhaps underline the diminished role of ideologies of parties and governments and of the personal inclinations of prime ministers to these ideologies. One is inclined to guess that these changes were designed on pragmatic considerations to adjust to or accelerate the developments of scale, technology and taste that have been taking place all over the world from which India could not have remained immune. The collapse of faith in the communist system of thought and the adoption of the market oriented policies in almost all communist countries of the world and the desire of these countries to break away from the earlier autarkical policies and to integrate their economies with the economies of the rest of the world especially with the advanced capitalist countries, is also a movement of the same kind as the one seen above in the Indian context.

Notes

[This article was prepared before the announcement of the new policy for the small scale sector which the author proposes to cover in a further note.]

1. The 18 industries for which industrial licensing is compulsory are (1) coal and lignite, (2) petroleum (other than crude) and its distillation products, (3) distillation and brewing of alcoholic drinks, (4) sugar, (5) animal fats and oils, (6) cigars and cigarettes of tobacco and manufactured tobacco substitutes, (7) asbestos and asbestos based products, (8) plywood, decorative veneers and other wood based products such as particle board, medium density fibre board, block board, (9) raw hides and skins, leather, chamois leather and patent leather, (10) tanned or dressed furskins, (11) motor cars, (12) paper and newspapers except bagasse based units, (13) electronic aerospace and defence equipment, all types, (14) industrial explosives including detonating fuse, safety fuse, gun powder, nitrocellulose and matches, (15) hazardous chemicals, (16) drugs and pharmaceuticals (according to drug policy), (17) entertainment electronic (VCRs, colour TVs, CD players, tape recorders), and (18) white goods (domestic refrigerators, domestic dishwashing machines, programmable domestic washing machines, microwave ovens, air conditioners).

As of June 1989, industrial licensing was compulsory for 27 industries. Of these, only 11 remain in the above list, namely, numbers 1, 3, 4, 5, 7, 8, 9, 11, 13, 14 and 15. Seven new industries (which were not there in the

above 27 named against numbers 2, 6, 10, 12, 16, 17 and 18) are added by the present change

On the other hand, 16 of the 27 industries do not figure in new list. These are (1) textiles, (2) milk foods, etc., (3) matches, (4) slitting/confectionery of photo-sensitised material for jumbo rolls, (5) telecommunication equipment, etc., (6) computer peripherals, (7) micro-processor based industrial control instrumentation system, and eight to 16 different types of metal based products relating to nine industries.

- 2 The 34 industries for 51 per cent foreign equity approval and automatic approval of foreign technology agreements are: (1) metallurgical industries, (2) boilers and steam generating plants, (3) prime movers (other than electrical generators), (4) electrical equipment, (5) transportation, (6) industrial machinery, (7) machine tools, etc., (8) agricultural machinery, (9) earth moving machinery, (10) industrial instruments, (11) scientific and electro medical instruments and laboratory equipment, (12) nitrogenous and phosphatic fertilisers, (13) chemicals (other than fertilisers), (14) drugs and pharmaceuticals, (15) paper and pulp including paper products and industrial laminates, (16) automobile tires and tubes, (17) plate glass, (18) ceramics, (19) cement products, (20) high technology reproduction and multiplication equipment, (21) carbon and carbon products, (22) pre-tensioned high pressure RCC pipes, (23) rubber machinery, (24) printing machinery, (25) welding electrodes other than those for welding mild steel, (26) industrial synthetic diamonds, (27) photo-synthesis improvers, (28) extraction and upgrading of minor oils, (29) pre-fabricated building material, (30) soya products, (31) certified high yielding hybrid seeds and synthetic seeds etc., (32) all food processing industries other than milk food related foods and flour, but excluding the items reserved for small scale sector, (33) all items of packaging for food processing industries excluding the items reserved for small scale sector, and (34) hotels and tourism related industry.

A number of products are specified under almost all of the above 34 industries which for want of space are not included here, and the list is restricted to naming the 30 broad industry groups.

- 3 The eight industries reserved for the public sector are: (1) arms and ammunition and allied items of defence equipment, defence aircraft and warships, (2) atomic energy, (3) coal and lignite, (4) mineral oils, (5) mining of iron ore, manganese ore, chrome ore, gypsum, sulphur, gold and diamond, (6) mining of copper, lead, zinc, tin, molybdenum and wolfram, (7) minerals specified in the schedule to the Atomic Energy (control of production and use) Order 1953, and (8) railway transport.

It may be recalled that the Industrial Policy Resolution 1956 had three categories of industry: Schedule A (17 industries reserved for public sector), Schedule B (12 industries where private sector was expected to supplement the effort of the state) and other industries left for the private sector.

Of the 17 industries of Schedule A, only the above eight remain in the reserve category. The nine industries left out are: (1) iron and steel, (2) heavy casting and forging of iron and steel, (3) heavy plant and machinery, (4) heavy electrical plant and machinery, (5) aircraft, (6) air transport, (7) ship building, (8) telephones and telephone cable and related products, and (9) generation and distribution of electricity.

- 4 Consider, for example, these statistics: Private investment as a proportion of total investment in our five year plans has been rising from 36 to 39 and 43 to 48 per cent in the fourth, the fifth, the sixth and the seventh plans. Centre for Monitoring Indian Economy, *The Liberalisation Process*, Bombay 1986, Table 2.2, p 17.

- 5 See Isher Judge Ahluwalia, *Industrial Growth in India: Stagnation since the Mid Sixties* Delhi 1985 and 'The Role of Policy in Industrial Development' in P R Brahmananda and V R Panchamukhi (ed) *The Development Process of the Indian Economy* Delhi 1987. Also, R Nagaraj, 'Industrial Growth: Further Evidence and Towards an Explanation and Issues', *Economic and Political Weekly*, Bombay

October 13, 1990.

- 6 *India Today*, New Delhi, July 31, 1991, has given the following numbers of the persons employed in some government departments/corporations concerned with foreign trade: Chief Controller of Imports and Exports 3,000, Directorate General of Supplies and Disposals 4,500, State Trading Corporation and Metals Trading Corporation 6,000; and Directorate General of Technical Development 1,100. It is clear that with liberalisation of external trade, a very large number of jobs from these organisations become redundant. Similarly, liberalisation of industrial policies and procedures and other liberalisations will also make a number of jobs in other government departments/corporations also redundant.

TAX DEDUCTORS/ TAXPAYERS

With effect from 28.2.91 Form 16B has been prescribed for TDS Certificates in respect of the following:

- Interest other than interest on securities
- Winnings from lotteries, cross word puzzles and horse races
- Payments to contractors or sub-contractors
- Payments to non-resident sportsmen and sports associations
- Other sums U/s 195
- Income of Foreign Companies referred to in Section 196A (2)

For the convenience of the tax deductors/taxpayers use of old **FORM No. 16** in lieu of form 16B has been permitted till **31.12.91**.

Role of Public and Private Sectors in India's Development

Selected Simulations from a Macroeconometric Model

Kalyan Raipuria
Rajesh Mehta

The authors' analysis shows that the present discussion in the country on the role of the public and private sectors in the economy is misplaced. While the public sector needs reforms, the possibilities of substitution by the private sector are extremely limited given the stage and the structure of the economy. The strategy of their complementary roles in promoting the growth of the economy remains valid. While there is scope for improving the production function of both the sectors, the channels and instruments of increasing the role of the private sector in the non agricultural sector need careful consideration if changes are not to lead to crises of growth and balance of payments.

I

Introduction

THE purpose of this paper is to discuss the effects of different options, brought out in terms of specific scenarios of change in the role of public and private sectors, in the light of the past performance and now apparent limits of the public sector discussed in Section II. The emphasis of analysis is on the quantitative framework of the economy at macro level for which specific and feasible scenario need to be considered. Thus Section III covers specific scenarios of change in the roles of the public and private sectors. The macro econometric model adopted and the results of simulation of scenarios with the model are discussed in Section IV. On the basis of the above, certain issues are raised in Section V which are for discussion by the policy makers of both the public and the private sectors and society at large for future perspectives.

II

Emerging Roles of Public and Private Sectors and Approach to Analysis

Public sector in a developing economy like India has a critical role in building up basic infrastructure and the core industrial base. That this sector should always be in the forefront to lead is a necessity given our social and economic structure: that public sector can continue to play a dominant role without generating surpluses for its development is, however, an ideological fixation of mind.

But, at the same time, privatisation in the United Kingdom and other countries, and recent developments in socialist Europe, with oft-quoted *glasnost* and *perestroika* (and now *uskornie* or 'acceleration'), which is a far cry so far) should not lead us to advocate across the board graduation of the role of the public sector and loosening of the planning mechanism. We should not lose sight of the achievements of a welfare state in the UK

and the removal of poverty and assurance of employment and minimum level of living in Socialist Europe compared to the continuing poverty, very low per capita incomes and huge open and disguised unemployment in the country.

The share of the public sector in total GDP (1989-90) at less than 30 per cent means that Indian economy is predominantly private, that its share in investment hovers around 45 per cent means that the public sector is critical for growth.¹

The share of output of state owned (central and sub national government) enterprises in GDP varies widely among countries. The share is higher in total investment and accounted for more than 20 per cent in 13 of the 19 developing countries selected for study. In Burma, Venezuela and Zambia, their share of total investment was more than half in 1984. In case of India, the share in industrial output works out to about 30 per cent while that in total invested capital of industry works out to much higher than half (52.5 per cent).

In respect of sector wise production as Table 1 shows, the public sector remains dominant in sectors like fuel, metals, nitrogenous fertilisers and communication equipment. These are the sectors wherein public ownership is high (more than 50 per cent) in many other countries, developed (e.g. Austria, France, Italy, Portugal and Sweden) and developing (e.g. Brazil, Ghana, Pakistan, Tunisia and Zambia).²

The role of the public sector in achieving import substitution in major sectors/products since the First Plan, shown in Table 2, needs to be recognised.

What is important to note for the present discussion is that public investment is based on significant budgetary support, substantial draft on private household and foreign savings and may not be conducive to an efficient and substantial growth process in the country. The share of the public sector in gross savings at less than 10 per cent and net savings being substantially negative imply critical problem of resource mobilisation for future growth.

While several high level groups within government have gone into the above problem and certain measures have been taken, it is recognised that substantially is already under doubt from both, though related, resource and efficiency angles. As an alternative, what is suggested is not only reform but change in the role of the public sector in favour of the private sector.

But the suggested change could mean different options including partial disinvestment, transfer of ownership to private sector, transfer of management to private professionals and setting new units only in private sector. These may involve crucial choices. Thus the changes need to be discussed in the light of socio economic benefits and cost to the economy as a whole in the medium term, if not in the very long run, keeping in view the basic objectives of the economy. The question can also be raised whether the private sector is prepared to share the increased responsibility in an agreeable operational policy framework. The question also is what would be its sources of financing?

Options, of course, include reform in public sector. Presently, there are 244 central public enterprises with total investment of Rs 99,315 crore (1989-90), but their profits aggregate Rs 3,782 crore only. Out of 244, 131 are profit making (profits Rs 5,741 crore), 98 are loss making (loss Rs 1,959 crore) and 15 are no profit no-loss. It is found that a 5 per cent improvement in the physical performance means increase in profits of Rs 5,000 crore. Furthermore, increased efficiency in loss making enterprises may fetch Rs 1,100 crore. Certain policy measures have been under way in this regard as the issue has been examined by various formal groups set up by the government. These can go on. But what is generally suggested is that public sector needs to be cut in size, exposed to competition and asked to yield returns to sustain its crucial role in future in certain areas including public utilities.³

What are the real possibilities and what are the implications of change in India need careful examination in the macro context. This is attempted in the following sections.

through scenario formulation and their simulation with a macro econometric model to have comparative advantage of consistency and magnitudes in results

III

Selected Scenarios for Simulation

Considering the various suggestions afloat for change in the roles of public/private sectors, in respect of change in ownership, sector of operation and financing, the following scenarios are selected for simulation

(A) Reduced level and share of public investment, i.e. crowding out of public sector (by 25 per cent). This could be done through certain measures including freezing of all borrowings

The reduced level of public sector investment and thus its share in total investment is examined to see how it affects given the observed behavioural relationships of the economy, and the growth process and to check if there is a real possibility of private sector crowding in. This is a major scenario for analysis to see that any reduction in public sector investment does not bring down the momentum of overall growth at the present low levels of per capita income

(B) Increase in the share of private sector in non agricultural economy on the margin, as part of Plan projections of investment and foreign inflows

Given the fact that agriculture is already in the private sector, this scenario aims to check if increased role of private sector leads to distortion in the growth process and, on the margin, in the non agricultural sector, including infrastructure, infeasible level of

imports and other foreign exchange expenditure

(C) Increase in the share of private sector through substantial increase in foreign direct (private) investment (FDI) inflows, in the non agricultural sector

The aim in this scenario building and simulation is to examine the role of increased foreign investment flows in the private sector in the non agricultural sector and its economy wide impact. The level of foreign investment assumed is US \$ 1 billion annually

(D) Privatisation in terms of transfer of substantial assets of public sector in non agricultural sector to the private sector

This scenario examines the effect of disinvestment of equity of the public enterprises in favour of private sector, assuming that the means devised to implement this would be acceptable to the government and the private investors, and that this will absolve the government of the responsibility of increasing budgetary support every year in the face of substantial fiscal deficit, and/or increasing borrowings through bonds normal (13 per cent interest) and tax free (9 per cent interest) by public enterprises, given the problem of not so encouraging growth of internal resources

IV

The Model and Results of Simulation of Scenarios

The results presented in this paper are based on a macro econometric model for India developed by Mehta and Sinha.⁶ The Annexure gives the model specification. The

model has emphasis *inter alia* of three aspects, (i) external trade, (ii) public sector, and (iii) economic liberalisation. The model consists of 44 equations of which 21 are behavioural equations which have been categorised in six sub sets, viz, (a) expenditure (b) production, (c) public sector, (d) trade, (e) money and prices, and (f) foodgrains

The total number of variables in the model is 83. The parameters of each equation have been estimated using data for the period 1951-52 to 1985-86. The figures are at 1970-71 prices. The salient features of the model, which have been incorporated for the first time in macro-econometric modelling for India, are (i) the disaggregation of the public sector by the type of sectors and different categories (administrative, department and non departmental undertakings), (ii) the role of credit, and (iii) the asymmetric impact of custom tariffs on import prices

The credibility of the estimated framework was checked before the simulation results were obtained. Since the parameters of the estimated model might have changed during the *ex post* sample periods, the validity of the model was also checked for the period 1986-88. The simulation results have been carried out by a dynamic inter active simulation procedure

It should be noted that the present model is exploratory in nature and requires further refinement in formulation, estimation and simulation in the context of privatisation. It calls for improvement in its specification by incorporating disaggregate sectors for domestic external demand by public and private sectors for different industrial groups, and labour block

TABLE I. SHARE OF PUBLIC SECTOR IN INDIA'S NATIONAL PRODUCTION OF CORE ITEMS: 1968-69, 1984-85 AND 1989-90

| Item | Unit | National Production | | | Public Sector's Production | | | Per Cent Share of Public Sector in National Production | | |
|--------------------------|-------------|---------------------|--------------------|---------------------|----------------------------|---------------------|---------------------|--|---------|---------|

Notes: a Includes CIL/SCCL/TISCO/HISCO/DVC, b Includes Singareni Collieries, c Includes Gujarat production, d Includes production of ingots/concast billets by electric arc furnace units, e Includes production of secondary producers, i.e. mini-steel plants and re-rollers

Source: Bureau of Public Enterprises, *Public Enterprises Survey*, various issues

Due to this reason, simulation for all the scenarios mentioned in the last section could not be attempted satisfactorily. The results for three scenarios for which the model could be simulated are reported in Table 3 along with the base solution. In what follows these are briefly discussed.

Scenario A: Decline in the level of public sector investment by 25 per cent, from Rs 5,307 crore to Rs 4,027 crore (43.3 per cent of Rs 9,300 crore), leads to decline in private sector investment level by 10 per cent, that is, to reduced crowding-in effect. A 25 per cent decline in the public sector investment leads to decline in the private sector investment by 10 per cent. In the changed scenario the share of public investment in baseline scenario is 43.3 per cent. Hence the decline in total investment is 20 per cent. Similar results have been obtained earlier also in certain studies. The above decline in public sector and thus private sector investment leads to decline in national output by 1.3 per cent which is not an insignificant result. In a developing country like India, any trends of declining rate of investment are not welcome because they would lead to unwelcome recessions in the economy. Furthermore, it was found that this scenario leads to the lowering of deficit financing but a rise in prices by 4 per cent is the result due to demand factors.

Scenario A1: In this scenario the decline in public sector investment is imposed on the non-agriculture sector only. The results of this scenario are not different from that of the last scenario. The decline in investment

and output levels from the base solution is prominent in only non-agriculture sector. What is notable is that the decline in the level of consumption expenditure is not so significant as in the last scenario.

Scenario D: In this scenario the impact of increase in private sector investment due to foreign direct investment (FDI) flows are examined. The major limitations of the model in regard to this scenario need to be noted. Firstly, that the model being short-run does not take into account the impact of profit transfers which may take place over

the period. Secondly, the model does not consider the economic impact of FDI on domestic investment. What the results, given the limitations, show is that this scenario leads to increase in the GDP level by 2 per cent, and increase in per capita personal disposal income by 1.5 per cent. But these are accompanied by increase in the levels of prices as well as amount of trade deficit. Total imports increase by 33 per cent compared to the base level scenario and the increase in exports being negligible, leads to the increase in trade deficit by 25 per cent.

TABLE 3. ROLE OF PUBLIC PRIVATE SECTORS IN INDIAN ECONOMY: ALTERNATE SCENARIOS

A MACROECONOMETRIC MODEL OF INDIA

The estimated model by Mehta and Sinha (1989) including its sub sets of equations along with the definitional identities is given below. The model has been deliberately restricted to a moderate size so that its causal networks can be seen clearly, and simulations can be undertaken with alternative values of exogenous variables. Its general equilibrium impact multipliers, if derived, can be used for evaluating consequences of different policies.

Each equation has been estimated separately using OLS method. The negative numerical subscript in parentheses refers to the order of lag, and figures beneath the co-efficients and within parentheses are *t* values. The sample consists of 34 years' data.

| | | (2.08) | (6.72) | (0.55) | | | (1.16) |

The following is an alphabetical list of the endogenous variables, exogenous variables and dummy variables appearing in the model. Unless otherwise indicated, all monetary variables are crores rupees, and stock variables are at the end of last financial year.

| <i>Endogenous Variables</i> | | | | | |
|-----------------------------|--|----------------------------|--|------------------------------|---|
| CONS | Private final consumption expenditure | P_f | Index number of wholesale price of foodgrains (1970-71 = 100) | INVGNAND | Gross investment in public sector in non-agriculture, non-departmental undertakings. |
| DF | Consumption of foodgrains | P_m | Unit value index of the imports (1970-71 = 100) | LNA | Total labour force in non-agriculture (million) |
| DEFG | Deficit finance of government budget | P_x | Index number of unit value of exports (1970-71 = 100) | MNFSC | Value of imports other than foodgrains from centrally planned economies. |
| GDPA | Gross domestic product in agriculture sector at FC | P_y | Index of implicit price deflator of GDP (1970-71 = 100) | NPOP | Total population (crore) |
| GDPNA | Gross domestic product in non-agriculture sector at FC | QI | Net production of foodgrains (million tonnes) | NIA | Net income from abroad |
| GOVT | Government expenditure on goods and services | REV | Total revenue receipts of government | OEXG | Other government expenditure such as current transfers to other sectors mainly education, calamities, etc. |
| GNPF | Gross national product at FC | SAVG ₁ | Saving of general government (administration + departmental enterprises) | P_{adm} | Administrative price index |
| INV | Gross investment | SF | Total availability of food grains net of imports (mn tonnes) | P_{mi} | Index of import price of foodgrains (1970-71 = 100) |
| INVA | Gross investment in agriculture | SFM | Total availability of foodgrains (million tonnes) | P_{m1} | Procurement price index for wheat (1970-71 = 100) |
| INVNA | Gross investment in non agriculture | TAXD | Direct taxes | P_c | Unit value index of exports of competitive countries (i.e., non oil developing countries) |
| INVGD | Investment in general government (i.e., administration and departmental enterprises) | TAXI | Total indirect taxes | P_v | General price index of customer countries (1970-71 = 100) — weighted average of major importers |
| INVPA | Gross investment in private sector agriculture | XI | Total exports | | |
| INVPNA | Gross investment in private sector non agriculture | XIME | Total exports to the market economy | | |
| INVQAD | Gross investment in public sector in agriculture | YNNP | Net national product at FC | SUBA | Govt subsidies to agriculture sector |
| INVGNA | Gross investment in public sector, non agriculture | YPD | Personal disposable income | SUBNA | Govt subsidies to non agriculture sector |
| INVGNAD | Gross investment in public sector in non agriculture | | | IASS | Total assets inclusive of liquid assets |
| | departmental undertakings | <i>Exogenous Variables</i> | | ID | Time deposits at current prices |
| K | Total capital stock | AIDRS | PI 480 and other aid | IRR | Average tariff rates for imports |
| KA | Capital stock in agriculture | BRC | Net borrowings of the government | NFSC | Total exports to centrally planned economies |
| KNA | Capital stock in non agriculture | CRGB | Credit to the public sector by banks | YIAR | Target value of domestic income |
| MDUI | Total receipt from custom duties (imports) | CRPB | Credit to the private sector by banks | Y | Index of GNP at FC of customer countries at constant prices (1970-71 = 100) — weighted average of major importers |
| MFQ | Quantity of foodgrains imports (million tonnes) | CRPA | Total credit to the agriculture sector | ZI | Irrigation ratio (foodgrains only) |
| MFV | Value of imports of foodgrains | CSF | Change in stocks of foodgrains | | |
| MN-FME | Value of imports other than foodgrains from market economies | DLPA | Depreciation in the agriculture sector Rs per US \$ | | |
| MT | Total imports | EXRI | Foreign aid utilised (net of PI 480) | | |
| MR | Total monetary resources at current prices | FAU | Gross area sown (thousand hectares) | | |
| MS | Total monetary supply at current price | GAS | Gross area sown under foodgrains (thousand hectares) | | |
| OCRG | Other revenues, i.e., income from entrepreneurship and property | GASF | Gross area sown under foodgrains (thousand hectares) | | |
| OTAXI | Other indirect taxes excluding import duties collections | INVGAND | Gross investment in public sector in agriculture, non departmental enterprises | | |
| | | | | <i>Dummy Variables, etc.</i> | |
| | | | | δ | Dummy variables for structural change 1975 onwards |
| | | | | P_{om1} | Average price of the imported foodgrains in the base period, i.e., 1970-71. |

V Certain Issues

Our analysis shows that the present discussion in the country on the relative role of public and private sectors in the economy is misplaced. While the public sector needs reforms, the possibilities of substitution by private sector may be extremely limited given the stage and the structure of the economy. The strategy of their complementary roles in promoting growth of the economy remains valid. There is scope for improving the production function of both the sectors. Furthermore, the channels and instruments of increasing the role of the private sector in the non-agricultural sector need careful consideration as changes must not lead to crises of growth and balance of payments.

The following major issues can be raised. Without substantial change in the relative roles of public and private sectors, what concrete measures need consideration for reform? How to design future development planning which combines their roles for raising efficiency and growth? What should be the changes in the sectoral emphasis to achieve the above objectives, keeping in view that both the sectors need to grow in harmony and at the same time provide support for the accepted objectives of achieving faster growth, maximum employment, generation and long term self reliance.

A number of issues arise in respect of financing. Whether public sector has really crowded out the private sector in the recent past given its observed realisation of capital market financing. Is financial deregulation a pre-requisite for increased role of private enterprises in material sector? Furthermore, given the constrained conventional inflows from abroad, how to combine domestic and foreign financing to minimise future balance of payments liabilities.

The issues raised above based on a macro

level quantitative exercise may be compared with certain non issues being raised in the discussion of the kind based on qualitative and micro level thinking.

Notes

[This paper has been prepared in the authors' personal capacity and the views expressed here may not be those of their organisations.]

1 It may be of interest to note that as much as about 14 per cent of GDP is allocated as public sector outlay, among the ministries/departments and the states, according to sectors by the Planning Commission, given the important ratios of Indian economy (base line scenario) as

- (i) gross domestic savings/GDP: 20 per cent
- (ii) gross investment/GDP: 22 per cent
- (iii) public sector investment/total investment: 48 per cent
- (iv) public sector outlay/total outlay: about 50 per cent and
- (v) public sector outlay/public sector investment: 1.16 accounted by revenue expenditure part included in the Plans incurred by the centre and states.

2 World Bank, *World Development Report 1985*, Figure 4.4, p. 67.

3 Central Statistical Organisation, *Annual Survey of Industries 1986-89*, Summary Results for Factor Sector, Ministry of Planning (1990).

4 World Bank, *World Development Report 1987*, Figure 4.4, p. 6.

5 A discussion on the relative yielding returns and hence the future development is provided in K. D. Raipuria, 'Resource Mobilisation for Public Sector Development', *Economic and Political Weekly*, January 19, 1991. Paper was originally prepared for the conference of chief executives of central public enterprises held in August 1990.

6 R. Mehta and N. Sinha (1989), 'External Trade, Public Sector and Indian Economy: A Macroeconometric Study', Inter-Link

Country Model System organised by RIS and Escap, February 1984, New Delhi.

7 K. Krishnamurthy et al., for example, examined the complementarity as well as crowding-out effects of public sector for different industries. The results indicate that there is complementarity particularly observed in the late seventies. In one of the scenarios, Krishnamurthy concludes: "The increase in public investment, tones up activity all round. It increases growth rate of output of all sectors, private real investment in agriculture and industry and private savings" (emphasis ours). See 'Inflation and Growth: A Model for India', *Indian Economic Review*, XIX/1, January-June, 1984.

Unhelpful Disappointments

Rudolf C Heredia

THERE is perhaps little any one can do about Sujit K Das's disappointment with 'Social Medicine for Holistic Health' (*EPW*, April 6), since it seems to come from a self-confessed "intellectual limitation" that derisively dismisses contrary points of view as "intellectual mumbo-jumbo". Rather I'll try to address the substantive issues he has raised.

Firstly, regarding definitions the WHO definition of health he rejects as western is precisely the basis for a comprehensive health policy as proposed by the study group of the ICSSR and the ICMR in *Health for All* (Indian Institute of Education, Pune, 1981). Residual definitions, i.e. defining something by what it is *not*, are much less helpful for broad policy making. Thus 'poverty' can be defined as the 'absence of wealth', or in terms of exploitative and unjust social structures. The second broadens the concept beyond the mere economic without negating it. However, the development policies that derive from these two understandings of poverty would be radically different. This is what the development debate is all about. What we need now is a medical version of the same.

Moreover, qualitative definitions can be operationalised with very specific indicators. These must be creatively contextualised. It would be more precise to use 'absence of disease' or even its incidence, as one indicator of health, not a comprehensive or even a practical definition, much less a description of it.

Secondly, regarding scientific medicine and the bio medical model, which derives from it and has so completely appropriated modern medicine rather than a rejection in toto, what is being stressed are its limitations. When uncritically accepted this model is counter productive. It needs to be extended and deepened. If health is understood only as a matter of 'biology', then these limitations go unrecognised. But can we reduce human beings to their biology in such a vital matter as health? Are there not other dimensions, e.g. psychological and social? But then again this will depend on how health is defined.

Moreover, faith in modern science, medical or otherwise, has been radically questioned not only in the developed but in the developing world too. Pritish Nandy and Claude Alvares have written eloquently on this. How much of the ecological crisis has been precipitated by blind faith in the omnipotence of science and technology? Medical science too needs a critical review, to uncover more precisely where it helps and where it hinders unless of course one believes

that there can be no such thing as a bad science.

Further, science and the technology foster their own inherent dynamic that impinges on society and culture. This negates the idea of a value neutral science. Even an apparently neutral technology can have unintended effects. Think of the way Galileo's or Descartes' scientific theories have affected renaissance thinking. Or the way computers and media have changed modern politics. Unless we are aware of such influences we will never be able to control them. Energy provides a ready illustration. No amount of political will can decentralise nuclear energy. Its very scale and character demands the contrary for efficiency and safety. Bio gas is the exact opposite. It would be disingenuous to deny the effect of centralised and decentralised sources of energy on a society.

Certainly access to the health care system of a society will also depend on its political structure. Equality of access in one will depend on the equality of empowerment in the other. But to think that this can be brought about by a liberal democracy defined in terms of 'freedom and self-determination' is to be blind to the post independence experience of this country. What is needed is a 'participative democracy', not a 'plebiscitary' one as Rajni Kothari says. And hi tech, capital intensive technology, does not lend itself to this. Medical technology is no exception.

It is precisely the urgency of our situation that demands a theoretical perspective to comprehend in order to respond to it, creatively and constructively. A mere precipitate 'ad hocism' does neither. Practical models are needed and some are already at hand, e.g. with the Medico Friends Circle. But these cannot be sustained without a theory to justify them and inspire a multiplier effect. My article tried to do this. If it fails it will be for reasons other than the one that disappointed Das.

MAKE AN INTELLIGENT MOVE

EXEMPT YOUR CAPITAL GAINS FROM TAX INVEST IN IDBI CAPITAL BONDS

Long term capital gains from the sale of land, buildings, jewellery, shares etc attract Income Tax. But there is a way out. Invest in IDBI CAPITAL BONDS keep your capital intact and earn interest too.

- Bonds available at par throughout the year
- Exemption from tax on Capital Gains under Section 54E of the Income Tax Act 1961
- Income tax benefit under Section 80I
- Exemption upto Rs. 5 lakhs from Wealth Tax under Section 5(1) (xvii) read with Section 5(1A) of the Wealth Tax Act 1957
- Interest at 9% p.a payable half yearly
- At the investor's option, interest for the full period of 3 years can be paid in advance on discounted basis
- No deduction of tax at source
- Outstation cheques accepted and cost of collection borne by IDBI

Sobhagya/IDBI/91

Two Exciting Options!

DEFERRED INCOME UNIT SCHEME

**Dividends
that grow up to 30%.
Plus 2 Bonus Dividends
in 5 years.**

The first option gives you a growing income plus two bonus dividends after an initial waiting period of two years. In the third year, you earn an 18% dividend. In the fourth year, you earn 24%. In the fifth year, your dividend goes up to 30%. What's more, you get two bonus dividends in the 3rd and 4th year, payable on maturity.

The second option gives you high growth. Your money doubles, yes doubles, in just five years.

**Or
double your money
in just
5 years.**

Other details

The cost per Unit is Rs. 10. Available at par.

The minimum investment is Rs. 1000 and thereafter in multiples of Rs. 1000. There is no maximum.

The period of the Scheme is 5 years.

There is capital appreciation on maturity.

Facilities for nomination and transfer are available.

Deferred Income
Unit Scheme '91
is open between 1st August
and 31st August '91.

UNIT TRUST OF INDIA
At the service of One Crore Unit holders.

Capitalism and Caste

While the rise of the political power of kulaks is associated with the development of capitalism in agriculture, there is no one-to-one correspondence between the two. It is only when, after the development of capitalism in agriculture, the kulaks' class interests come into clash with those of the ruling class that the seed of political struggle between the two is sown. In India this process gets complicated because of traditional feudal identities related to caste and religion. An overview of the rise of kulak power and caste struggle in different parts of north India.

1923

Ambedkar's Legacy

Ambedkar's legacy to the Dalits is primarily the constitutional safeguards for the scheduled castes and the celebration of his birth centenary should be the occasion to examine if the nation has really honoured the legacy or reneged on its promises to honour it. An assessment of the performance of various measures undertaken in pursuance of the constitutional safeguards for SCs.

1911

'Right to Work'

Seventy per cent of the people below the poverty line are concentrated in eight states where agriculture is rainfed, where the degradation of the land has reached dismal proportions and where the productivity of farm labour is very low. How will the 'right to work' concept help in this situation?

1893

Whose Say-So?

The Press Council's report on Kashmir has become a convenient tool to pillory human rights groups who are charged with being duped by the say-so of alleged victims and propagandists. But is not the report itself one-sided, based as it is on the say-so of the army?

1899

Marxism's Crisis

Marxism's strength lay in its claim to be a critical theory with practical intent. If this claim is no longer convincing, what is at the root of the crisis?

1934

Not Many Flowers

There are three major obstacles to the realisation of democracy in China today.

1905

Bihar Elections

The 1991 Lok Sabha elections in Bihar will be remembered as a watershed because the people refused to be swayed by non-issues and chose to vote on the real issues which affect their day-to-day lives.

1895

Colonial Science

The production and growth of science in colonial India had the objective of furthering colonial interests. British-sponsored science was, by its very nature, field science and its agenda was decided on grounds of political and commercial gain.

1927

Puzzled Pundits

The stock market is experiencing an unprecedented boom which has confounded not only political and economic pundits but also experienced marketmen.

1887

Communal Politics

The BJP's position on Hindu-Muslim relations has undergone considerable change during the decade of its existence, with the Mandal agitation acting as a spur to the party's current phase of communal politics.

1901

Communists and Demand for Pakistan

THIS refers to the letter of Ajit Roy on 'Communists and Demand for Pakistan' (June 22)

Roy's main contention is that "[Communists] never supported Pakistan but only the demand for the right of self determination of 'the various nationalities, such as Pathans, western Punjabis (dominantly Muslim), Sikhs, Sindhis, Hindustanis, Rajasthanis, Gujaratis, Bengalis, Assamese, Beharis, Oriyas, Andhras, Tamils, Karnatakas, Keralas, etc so that 'free India of tomorrow would be a federation or union of autonomous states' "

But from when did western Punjabis become a separate nationality? Just because they were Muslims? Jinnah's point was exactly that—the Muslims are a separate nation. And what about the Bengalis mentioned above? Are not they then by the same standard two separate nationalities as Jinnah thought? Yes, and the communists thought the same. The above quotation of Ajit Roy is from the resolution passed by the enlarged plenum of the central committee of the Communist Party of India (CPI) on September 19, 1942 and confirmed by the first congress of the CPI in May 1943. In that resolution, it is later also stated that "in the case of the Bengali Muslims of the eastern and northern districts of Bengal where they form an overwhelming majority, they may form themselves into an autonomous region in the state of Bengal or may form a separate state. Such a declaration therefore concedes the just essence of the Pakistan demand. Then it is added that it "has nothing in common with the separatist theory of dividing India into two nations on the basis of religion"

The report by G. Adhikari then, suprema of the CPI before the same plenum was more explicit. In its concluding section the report clearly stated "Our solution concedes to Sind, NW F Province, Punjab and eastern districts of Bengal the right of self determination to the point of secession. This means these states whose exact boundaries would be determined by the people later, can be autonomous and sovereign and form the federation within an Indian Union or they may secede and form their federation without" (emphasis added). I hope it does not need explanation that this "federation

without" means Jinnah's Pakistan.

Though the 1943 resolution maintained the facade of free India as a "federation or union of autonomous states", by 1945 even that facade was no more necessary. In the resolution of the CPI of December 1945 it is clarified "We recognise the freedom urge behind the Pakistan demand. Our stand would guarantee complete self determination to national units with Muslim majority and enable them to form a separate federation if they so desire" (emphasis added).

When the partition scheme was finalised after the Mountbatten Award, the CPI in its political resolution of June 1947 stated, "[British imperialism's] utter weakness has forced it to make important concessions to the urgent demands of the national liberation movement such as for example

(a) Transfer of power to Congress and League governments on dominion status basis by August 15.

The resolution added "the two popular governments and constituent assemblies are the strategic weapons in the hands of national leadership.

So the CPI accepted the formation of two separate governments as a victory for the national movement. And the CPI never

raised its voice for annulment of partition, rather the above mentioned resolution's call for "Indian unity" meant "establishment of friendly relations between Pakistan and India."

After all this, some respected communists will tell us again that they did not support the demand for Pakistan. These dry pages of history, I am sure, will then be interpreted in a more imaginative 'dialectical' way by communist intellectuals to erase their guilt at being a party to the partition of India. But the real human memories would keep alive the truth. My mother residing in a small east Bengal town, Kishoregunj, still remembers 14th of August 1947. On that day communist party workers went from house to house of Hindu families to force them to raise the Pakistani national flag and even bought the flags from their own pockets. The communists to appease Islamic fundamentalists still practise the two nation theory. They created a new Muslim majority district in Kerala. But in communist West Bengal a reference to the right of self determination for Gorkhaland or Jharkhand will put you in the reactionary anti-patriotic camp.

All remittances to Economic and Political Weekly

Losing Battle

THE index of wholesale prices has risen by 2.3 per cent in the fortnight following the presentation of the budget for 1991-92 and the annual rate of inflation, as measured by the price index for the week ended August 3, has gone up to 12.9 per cent. Control of inflationary pressures in the economy is ostensibly a major objective of the government's economic policies and, towards that end, reduction of the budgetary gap, whether denoted by the conventional concept of deficit financing or by the IMF World Bank favoured ideologically weighted concept of the fiscal deficit, was the principal, in fact almost the sole, focus of the budgetary sums unveiled by the finance minister in parliament on July 24. But already the many contradictions in the government's efforts to bring inflation under control are beginning to be exposed.

Monetary expansion in the economy has, it is true, vastly outpaced the growth of real output year after year. It is a fact also that this expansion has been fuelled to a considerable extent by the widening gap in the government's budgetary operations. At the same time, a marked feature of the particular measure, which the government has now chosen to adopt to reduce the budgetary gap and deal with the other economic problems facing it is their potential for imparting a strong cost push impetus to inflation.

The implications of last month's devaluation of the rupee for costs and prices across a wide range of industries and products are already manifest and this process will go on as, under the so called flexible exchange rate policy, the exchange value of the rupee continues to be eroded as has been continually happening for the last so many years. Equally unavoidable will be the consequences of the increases, those already effected as well as those on the anvil, in the administered price of major industrial intermediates such as petroleum products, coal and steel, among others. Having decided at the outset to eschew placing the burden of balancing the budget on the shoulders of the rich and the relatively well off through measures to raise the yields from direct taxes—notwithstanding all the available evidence that what these sections of the population are made to part with in the form of income and other direct taxes has been coming down precipitately as a proportion of their buoyant incomes and wealth—the finance minister has had no option but to resort to increases in administered prices and to persist with the established pattern relying overwhelmingly on indirect taxes for raising additional tax revenue. The expected yield from all the direct taxes as a proportion of the government's total gross tax revenue in 1991-92 is in fact lower at 19.8 per cent compared to 20.7 per cent in 1990-91 as per the revised estimates for the year. And this is inclusive of the receipts of Rs 535 crore expected from the tax on the interest incomes of financial institutions which, though included in direct tax receipts by the finance minister, is being passed on to the borrowers from the

banks and the financial institutions in the form of enhanced interest charges, thereby adding to the trend of rising interest rates which cannot but push up costs across the board.

The finance minister has, in his budget speech, also promised to compensate farmers for the increase in the price of fertilisers through increased procurement prices payable by the government. This was quite a cavalier posture to strike, especially after the experience of last year. The government's *Economic Survey* frankly acknowledges that the substantial increases in procurement prices allowed last year and the consequent increases in issue prices had set the trends for the open market prices. As is well known, the rise in the prices of foodgrains, and of cereals especially, made a major contribution to the overall price rise in 1990-91.

All told, then, on the prices front what the government hopes to gain on the swins by its deficit cutting exercises in the budget it is likely to more than lose on the roundabouts as a result of its other economic policy measures. In fact, the upward pressure on prices exerted by the latter is bound, as the year progresses, to undermine the government's efforts to contain the budgetary gap as well. After all, in 1990-91, according to the revised estimates for the year, the fiscal deficit exceeded the figure provided for in the budget by Rs 6,536 crore and the budgetary deficit overshot the budgetary mark by Rs 3,566

crore. In the current year, given the likelihood of a slowing down of the rate of growth of the economy from 5.4 per cent to around 3.5 per cent, in any case the disjunction between monetary expansion and the growth of output might not be appreciably repaired even if the finance minister's optimism in regard to the containment of the budgetary deficit were to be substantially realised.

Already, in the budget as formulated, it is programmes such as those for employment generation which have borne the brunt of the pruning of government expenditure required to meet the IMF's specifications with regard to fiscal management. But with the budgetary arithmetic thrown into disarray by the growing momentum of the price rise and with the IMF proving intractable on the subject of the level of the fiscal deficit, it is government expenditure on programmes directed at the relatively poorer sections of the population which will take a further beating. Sophisticated advocates of structural adjustment and IMF conditionalities have been apt to point out that what the IMF is asking for is after all only that aggregate government expenditure be contained to restore the fiscal balance, not for particular item of expenditure to be cut, and that if the government is so concerned about social welfare and justice, it is open to it to protect the relevant heads of expenditure at the expense of the others. The trouble is that the rest of the IMF's package of economic policy measures effectively ensures that this just will not happen.

KARNATAKA

Survival Tactics

IF chief minister S Bangarappa has been granted a reprieve, it is certainly not because of any particular political or executive skills on his part. In fact, his manner and actions seem to have been calculated to sharpen the opposition to him providing it with the right kind of ammunition. To begin with he was not a popular choice after the peremptory removal of Veerendra Patil. If the change could be carried through it was only because of Rajiv Gandhi, whose style of functioning brooked no opposition.

Bangarappa began his innings typically by mass transfers of civil servants. This provoked much criticism and many bureaucrats reportedly sought transfers out of the state on the plea that they were not being allowed to carry out their duties properly. By June, after the elections, this began to be held up as an important illustration of Bangarappa's mismanagement, especially when the Mysore police commissioner, who had been investigating the case of the deputy commissioner of police accused of killing a factory worker was transferred together with two other officers who had been assisting him in the investigation.

Bangarappa had by this time chalked up other 'successes'. One such was the granting of leases for granite quarrying to 220 private parties circumventing an earlier high court order. Although the grants were stayed, in the fortnight it took to get the process going, more than 2,000 acres of land had already been taken over by private parties.

July brought the Cauvery issue to the fore and Bangarappa saw an opportunity to redeem his position among certain sections of the electorate. Unfortunately, either he had not reckoned with the repercussions or had miscalculated the centre's inclinations. The Cauvery ordinance, while on the one hand it was seen as a bold step, also became a convenient weapon for the dissident group to use against him. If the central leadership had been embarrassed by the passage of the ordinance, it could hardly have been less so by the dissidents' trek to Delhi to seek the chief minister's dismissal.

Bangarappa sought to soothe ruffled feathers by expanding his cabinet by the addition of 13 members. While it now had a better representation from the vocal and powerful Lingayat and Vokkaliga communities as well as from the Veerendra Patil group, Bangarappa had in fact made imply sure that it was a 'low weight' cabinet. Senior leaders were either left out, not consulted or given marginal and unimportant ministries. For instance, four senior ministers, K H Patil, K S Nagaiahanna, B Basavalingappa and Puttaswamy Gowda who had their portfolios

changed twice in the course of nine months were now shunted off to ministries where they could have little say. The phone-tapping issue, especially the fact that several MPs had also been victims, should really have put the finishing touch to the campaign of the dissidents or the 'save the Congress' group as they call themselves. Why Bangarappa continues to hold office is, therefore, more because of the set of circumstances which the central leadership of the party is having to grapple with from its precarious perch than anything else. Perhaps it may lead the Karnataka leader into some ruminations—that Rajiv Gandhi's style of functioning is ineffective and counter-productive without Rajiv Gandhi at the centre, figuratively and politically.

EXCHANGE EARNINGS

Piecemeal Approach

UNDER the head 'incentives for earning foreign exchange', the memorandum explaining the provisions of the Finance Bill lists three changes in the existing rules covering the treatment of foreign exchange earnings: first, extending to processed minerals and ores the concession of full deductibility of export profits under section 80 HHC; second, granting of full deductibility to export of software; and third, extending the benefit of section 80-O to non-corporate tax payers also of 50 per cent deduction in respect of income received in convertible foreign exchange by way of royalties, commission, fees, etc. This last concession is, as is pointed out by the finance minister in his budget speech, presently available only to the corporate sector.

Let us start with a general observation about the distinction the existing provision on concessions to exports attempts to draw between commodity exports and service exports. While earnings from the former are sought to be fully exempted, those from the latter are selectively given a partial exemption of 50 to 75 per cent. This discrimination against the latter type of exchange earnings has little rationale. In fact, there is a strong case for doing exactly the opposite, namely, extending a higher concession to earnings from service exports because such exports would normally entail minimum of foreign exchange cost. In other words, the import content of such exports would tend to be minimal.

Coming to specific provisions, while the extension of the benefit of full tax exemption to earnings from the export of processed minerals and ores is a step in the right direction, can the question be avoided as to why earnings from the export of minerals and ores should be denied this benefit? One answer that can be anticipated is that by drawing the distinction between processed and unprocessed mine-

erals, the objective is to encourage value addition before the minerals are exported. But then are we at all linking the concession to the extent of processing or value addition? There is no indication to this effect in the memorandum. Isn't there a danger of firms resorting to superficial processing resulting in little value addition to qualify for total tax exemption? That the incentive to resort to some such subterfuge will be quite strong cannot be ruled out.

As regards the extension of full tax exemption to earnings from the export of software, regardless of whether such export was through magnetic media or on paper or through satellite data link or through consultancy even if delivered at the location of the foreign client outside India, this is tantamount to a recognition, however delayed, that there are at least some service exports which can be treated on par with commodity exports.

But this piecemeal approach will have to be abandoned if the objective is to maximise exchange earnings, be they from the export of commodities, processed, partially processed or even unprocessed, or from the export of services. In fact the extension to non-corporate tax payers of the benefit of section 80-O allowing partial tax exemption with respect to income from royalties, commission, technical fees, etc, serves to underline the fragmented approach being followed with respect to service exports. This approach is further exemplified by the provisions of sections 80-R, RR and RRA, which attempt to grant partial exemption to certain categories of professional income derived from foreign sources. These provisions draw highly questionable distinctions between professions and professions and between government servants and other professionals, distinctions that should never have been drawn in the first instance and which ought to be done away with immediately in the name of fairness. More importantly, the case is overwhelming for treating all foreign exchange earnings received within the country on par.

POLITICS

Mock Battle

THE BJP-Congress duel—or is it a duet?—centring on the sudden patriotic outburst of the scion of the Scindia house, collusive or otherwise, may not be so unwelcome to either, whatever the initial embarrassment. Their earlier collaboration in the election of the Lok Sabha speaker had caused raised eye brows, not only among sections of the public, but also in the ranks of both parties as well. Since another round of collaboration—in the election of the deputy speaker—was on the slate, there was an urgent need for at least a partial refurbishing of their fighting images vis-a-vis the other party,

before the BJP's turn came for the cashing in of the IOU from the Congress for getting its candidate in the chair of the deputy speaker. What, however, provoked Madhavrao Scindia's outburst at his Lucknow press conference is not definitively known so far, but he certainly gave the BJP a good opening for demonstrating its righteous indignation in the Lok Sabha for three days running. It relented only on the eve of the deputy speaker's election, seizing upon a rather vague assurance given by the speaker. With the election of the deputy speaker out of the way the BJP relaunches its onslaughts against Scindia, outside parliament this time and with some violence by its musclemen. After this demonstration of its oppositionist role *vis-à-vis* the ruling party, the BJP again cools down—L. K. Advani resuming his practised visage of sweet reasonableness.

The mock heroics on both sides can hardly deceive any discerning observer. Truly, neither is the house of Scindia a paragon of patriotic virtues, historically speaking, nor even particularly committed to secular democratic values, nor are the BJP, *nee* Jana Sangh, leaders very chary in attaching the stigma of treachery to their political adversaries, whose records of patriotic self sacrifice are, at least, more confirmed than theirs. Possibly such mock battles will recur in the coming days while the minority ruling party and the main opposition party in the Lok Sabha collaborate with each other in reinforcing the new economic regime under IMF guardianship.

This, of course, does not mean that either of the two sides is unanimous in pursuing this somewhat subtle, tactics. There are already deep rumblings against this in the Congress ranks. But without strong public opprobrium, the sliding of the Congress leaders into a liaison with the BJP may not be stemmed.

NRI REMITTANCES

Why This Neglect?

THE announcement in his budget speech by finance minister Manmohan Singh of an impending "comprehensive review of policies and procedures bearing on non-resident Indian investments", on the basis of which he intended to make further relaxations "in order to remove all procedural difficulties and impediments to the setting up of industrial and other venture by non-resident Indians" is significant in itself in several respects. In addition, the budget speech also announced the government's intention to establish a chief commissioner for non-resident Indians to serve as a focal point of the government's efforts to attract NRI investment.

The significance of the above announcements lies principally in that (i) the emphasis

is intended clearly to be on NRI investments, including investment in housing and real estate, even though for certain types of investment, as for example in residential housing, the proceeds from sale and rental income may be made non-repatriable, and (ii) direct private transfers made by NRIs in the form of remittances are conspicuous for the lack of any mention, even though it is through direct private transfers that the country has received foreign exchange far, far in excess of the inflow in the form of NRI deposits and investments put together. (Taking the decade of the 80s, the ratio of remittances to NRI deposits and investments works out to 2 to 1.) Furthermore, remittances do not carry the obligation of repatriation at any future date. So there is no danger of reverse flight of funds and that too at the most awkward of times as has reportedly happened in recent weeks and months in the case of NRI deposits.

Of course, a view could be taken that remittances by their very nature are bound to flow in anyway and that therefore there is nothing much that is called for to be done by government to stimulate any further increase in them. To take this view is not only defeatist but also shows utter obliviousness of the reality with respect to the pervasiveness of illegal channels of private transfers of funds.

The ground situation is that for various reasons the transfer of funds through illegal channels has been on the increase and has become very pervasive. The existence of the 'havala' market and the widening gap between the 'havala' rate and the official exchange rate are reflections of this ground situation. On empirical grounds also the stagnation in remittance inflows in recent years, despite the growing stock of overseas workers from India, even though the rate of increase had slowed down considerably in recent years, points to the likelihood of increasing diversion of private transfers to illegal channels.

A view could also be taken that what ever needs to be done in regard to private transfers belongs to the realm of enforcement and policing of regulations. That enforcement alone may have considerable scope for improvement cannot be gainsaid. Still a lot also could be done to improve the facilities for transfer of funds through banks. One reason often given for our NRI workers being drawn to the 'havala' market is that not only do they receive better exchange rates but they also are assured of much prompter and better service—like door to door delivery within three to five days of collection—than what the banks offer. It is not forget that our post offices still deliver money orders from door to door.

Should not the finance minister's proposed review of policies and procedure cover also those concerning NRI remittances? Is it not possible also to consider

extending to NRI remittances the benefit of import entitlement in the form of EXIM scrips, particularly when the entitlement has now been delinked from the import content of exports? Isn't that one way, a tried way at that, of offering a better exchange rate?

JHARKHAND

Little Advance

THOUGH all the major political parties operating in tribal Bihar compete with each other in demanding a separate Jharkhand state the project seems incapable of making any headway. The latest to hop on to the separate state bandwagon is the Congress with the Chhotanagpur and Santhal Pargana Regional Congress Committee (CSPRCC) president I. Mochi Rai Munda announcing the launch of a campaign with a view to achieving this goal. This espousal of Jharkhand statehood from the most unlikely quarters is scarcely a cause for surprise since this is the only cause that accounts for the success of even so opportunistic an outfit as the Jharkhand Mukti Morcha (JMM). The CSPRCC had been set up in 1990 to counter the JMM but found the issue too emotive and was in consequence relegated to insignificance by the latter. Joining the cause is the only available course. The Janata Dal victory in the state in 1991 is largely attributable to an alliance with the JMM while the BJP which performed remarkably well in tribal Bihar in the 1990 assembly elections on the platform of a Vananchal state suffered a setback this time largely because the party unit from the region broke away to form the Sampurna Kranti Dal.

But this rise in the strength of converts seems to be of little consequence. The general political consensus on the issue reveals the significance of the 14 parliamentary constituencies in the region and conceals the endless intrigue of the main protagonists. The source of the latest round of friction is the Jharkhand Area Development Council Bill which empowers the state government to dissolve the Chhotanagpur and Santhal Pargana Development Authority and replace it with a Jharkhand Development Council. Predictably all except the immediate beneficiaries have denounced the bill. The All Jharkhand Students Union's lone representative in the assembly has tendered his resignation on the ground that the council cannot be a substitute for separate statehood. He also added the mandatory allegation of a sellout by JMM leaders Shibu Soren and Suraj Mandal. While both Soren and Mandal have yet to make any public pronouncement on the bill another section of the JMM leadership led by general secretary Shailendra Mahato has denounced the bill vociferously, all but confirming the split in the JMM that its leadership is at pains

It is entirely possible that the bill is a logical fallout of the rivalry within the JMM between the Santhal Pargana-based Soren-Mandal group and the Singhbhum-based Mahato group. Mahato who had opposed the JMM's growing alliance with the Janata Dal had recently retreated from the separate state demand and settled for the Jharkhand Vikas Parishad as a first step on tactical grounds. But he has made it clear that a separate and independent administrative machinery, independent budget, education board, freedom in appointments and direct receipt of central allocation by the council are conditions for accepting a council.

What the bill provides for nowhere approaches these conditions. The bill, which fills in for a similar ordinance promulgated before the elections but which was aborted by the denial of the governor's assent, empowers the chief minister to nominate the chairman and vice chairman of the council. The term of the members of the council, included among whom are the finance minister, the planning minister and the welfare minister, is subject to the pleasure of the government. The plans drafted by the council will be submitted to the government for approval. Grants to the council will be deposited in the Jharkhand Development Council Fund. And finally the council can be dissolved by the government without furnishing reasons.

It is clear that none of these will ensure autonomy for the region even though all the major appointments are reserved exclusively for tribals. The whole seemingly pointless exercise of dismantling an already existing body to be replaced by another body which does not in any way represent a qualitative advance points to the mala fide intentions of the government. By doling out largesse in the form of appointments with duration, determined by the state government, co-opted members of the movement are kept on a short leash. Likewise the JMM or at least that segment of its leadership which is susceptible to the temptations of office can project the council as a significant advance. All the while the deliberately thwarted goal of statehood can continue to form the basis of tribal mobilisation.

BANGLADESH

Return to Parliamentary Politics

WITH the passing of the constitution amendment bill earlier this month, Bangladesh has reinstated the parliamentary form of government after 14 years. The bill, which had a stormy passage, was introduced in June and at times it had seemed that the reform would not go through at all. With this a phase in Bangladesh politics which began with the overthrow

of a state by a popular movement comes to an end.

Although at that time there was a common understanding among all the parties (other than the Jatiya Party) that a change in the form of government would be brought about quickly, the Bangladesh National Party was clearly in two minds about it, so much so that the Awami League attempted to pre-empt the issue by giving notice of presenting a bill to the effect in the recently-concluded session. This it did a week after the BNP had finally got its act together on the issue and tabled a constitution amendment bill. A final push was no doubt delivered by the unscheduled address to the nation by the president justice Shahbuddin Ahmed, just before the start of the session in which he expressed strong disapproval of the inaction on the political reform front which made it impossible to lay down office by October when, according to the constitution, he would need to call for presidential elections.

There were four major differences in the two bills. First, the League while agreeing to the president becoming a titular head elected by the members of parliament insisted that the elections must be conducted by the election commission and not by the speaker as suggested by the BNP. Secondly, while it agreed to the provision whereby non MPs could be inducted into the government, their proportion not exceeding one fifth of the number of MPs, it held that these members must seek election to parliament within a period of six months. Thirdly, it objected to BNP's stringent disqualification measures for MPs who had been dismissed by the party and had resigned from parliament. The BNP bill proposed that the MPs be disqualified from active politics (that is seeking election to parliament) for a period of five years. The League felt that this lowered the status of MPs who were more than just party members and represented a constituency to whom they were responsible. Fourthly, the BNP insisted that the reform must be carried through by a referendum and the League did not think this was necessary.

It is therefore quite significant that the 15 party select committee of parliament could unanimously come up with a consensus bill. In effect, the League has given in on the referendum and the induction of non MPs, but with a reduced proportion. The BNP has conceded the demand that the presidential elections be conducted by the election commission and has given up its insistence on the debarment of dismissed MPs from active politics for five years. The bill will now have to be carried through by a referendum and the presidential elections will have to be held soon so that the president can relinquish office. Clearly, the BNP has been able to turn the tables on the League and has wrested the initiative.

TWENTY YEARS AGO

EPW, August 14, 1971

It is necessary to repeat the tautology that the ruling group in any country sees foreign policy as a means of defending, preserving or extending its own internal—and consequently the country's external—interests. Looked at in that perspective, one of the more important reasons for the government's formalisation of its links with Russia, could perhaps be to reinforce the country's political system and structure. [This] will make it easier for the government to externalise internal political threats by harping on the China bogey.

The treaty with the Soviet Union has, if only temporarily, changed the entire domestic climate of opinion regarding the government's Bangladesh and foreign policies. In parliament, there has been a variety of emphases in welcoming the treaty but hardly any detracting views. Indira Gandhi has again with a good sense of timing disarmed her political opponents, this time through a compact with friends abroad.

To [the Russians] Indira Gandhi and her government are ideal allies: politically stable, temperamentally cautious, ideologically progressive enough and most important, willing to listen to Russian advice. The Soviet Union most probably sees the treaty primarily as a way to cooling the political climate in the subcontinent. From the Russian viewpoint, the treaty is the other side of the coin to American aid to and subsequent influence over Pakistan.

Just like in 1965 there seems to be a convergence of Russo-American interests as far as South Asia is concerned, with the difference that this time the Russians and Americans are jointly working towards the stabilisation of a situation which they consider too fluid and dangerous for their comfort. The US-Soviet reasoning is singularly unwelcome: big powers cannot allow small powers to drag them into confrontations with each other.

The longer term implications for the country's foreign policy are even more unsavoury. We have been drawn further into the unmeshing bondage of the superpowers. The sentiments that were expressed by India at the conference of non-aligned nations at Lusaka about the need for economic and political self-reliance will now be even more remote from reality. Due to the formalisation of links with a superpower, India's attempts to bring about closer commercial and political ties with 'non-aligned' countries in Africa and Latin America will be regarded with some suspicion by those countries. As for Sino-Indian relations, the Russians will insist on saying whether and when India should try to normalise relations with China, assuming that India itself is at all concerned about improving relations with Peking.

Pundits Proved Wrong

D P Sharma

THE stock market is experiencing an unprecedented boom. Few could have imagined that a market, which had got badly mauled by the nasty fall from its October peak and had been convalescing for over five months in an environment fouled by grave political uncertainties and the rapidly deteriorating balance of payments position, could make the kind of dash it has—moving well beyond its previous all-time high mark. The way the stock market balloon has been soaring of late has confounded not only political and economic pundits but also experienced marketmen.

The fall from the October 9 high had indeed been staggering. By January 25 the BSE sensitive index had come down from 1602.6 to 947.14, retracing almost two thirds of the preceding spectacular rise from 659.3 to 1602.6. And Dalal Street has had to live through the worst ever payments crisis precipitated in no small measure by the gross inadequacies of the stock exchange infrastructure to monitor the enormous increase in the volume of business (official and unofficial) and ensure completion of settlements, work relating to specified as well as non-specified scrips according to the stipulated schedule. The recovery from the January low was slow and halting. The BSE sensitive index registered a rise of 34 per cent till the end of June and the national index rose 12.8 per cent.

The market scene underwent a dramatic transformation during July with the BSE sensitive index recording a rise of 32.2 per cent and the national index moving up by 28.2 per cent. The accompanying tables bring out the changes in equity price indices since January 25 when the market stood at its lowest after the fall from the October 9 peak.

The phenomenal upsurge in equity price indices in spite of substantial institutional selling, especially by the Unit Trust of India and the sustained buoyancy in the volume of business despite curbs on trading reflects the stock market's endorsement of the unqualified welcome accorded by industry and trade to the series of initiatives taken by the government in respect of policies relating to exchange rates, industrial licensing, foreign investment, foreign technology agreements, public sector policy MRTP Act, fiscal strategy and import export trade.

The business community has every reason to feel jubilant over the government's decision to minimise bureaucratic control and remove several bottlenecks coming in the way of exports, industrial expansion and competition. Entrepreneurs will now enjoy considerable freedom to take investment decisions on the basis of their commercial

judgment.

Very briefly stated, the main ingredients of the policy package include (a) abolition of industrial licensing for all projects, except those in specified industries, irrespective of levels of investment; (b) allowing private sector investment in as many as 10 areas so far reserved for the public sector; (c) scrapping of assets limits in respect of MRTP companies; (d) automatic approval of foreign technology agreement as well as foreign equity participation up to 51 per cent in high priority industries; (e) automatic clearance for import of capital goods where foreign exchange is covered by foreign equity; (f) scrapping of convertibility clause which enabled financial institutions to convert loan into equity; (g) disinvestment of government equity in public sector undertakings to mutual fund and financial institutions; and (h) permitting flotation of mutual funds in the private sector. All this implies a basic change in the premises of economic regulation.

There are quite a number of proposals which are of direct relevance for the stock market. These include additional facility for transfer of funds by banks, tax concessions to off shore funds, increase in tax exemption for capital gains, increase in fertiliser prices, withdrawal of sugar subsidy and a radical trade policy aimed at boosting exports.

Political pundits and economists have seldom enjoyed much respect for their market judgment. But they can scarcely be faulted for watching with amazement the flight of the stock market balloon. The political scenario has many worrisome aspects. The minority Congress government at the centre with wrangles within the ruling party is unlikely to find it easy to combat forces of disintegration and disorder as also to steer clear of pressures from vested interests so as to be able to effectively implement the package of economic reforms. To what extent devaluation, liberal trade and industrial policies and the fiscal strategy spelt out by the union finance minister will help achieve macro economic adjustment, lure adequate foreign investment and bring about the much desired improvement in the balance of payments position, only time will tell. To cite from the finance minister's budget speech, the crisis in the economy is both acute and deep. We have not experienced anything similar in the history of independent India.

The spectacular rise in equity prices can not be dismissed as the doing of a few professional speculators commanding vast resources. The widely varying performance of industry group indices compiled by *The Economic Times* suggests that

speculators/investors keep a close watch over the changing fortunes of different industries and industrial units. The spurt in the shares of cement, shipping and fertiliser companies reflects the market's assessment of the implications of the various budget proposals and devaluation.

The country's premier stock exchange, Bombay, is said to be dominated by speculative elements. It might come as a surprise to many that among the regional equity price indices the sharpest rise has occurred in Delhi (91.7 per cent) followed by Madras (61.6 per cent), Ahmedabad (58.5 per cent), Bombay (54.6 per cent) and Calcutta (44.8 per cent).

While one might not like to question the market's collective judgment in pushing up equity prices to the prevailing high levels—the BSE sensitive index stands 6.5 per cent above its October high—it is quite likely that once the market takes a pause to do some serious introspection it may feel compelled to give due attention to the uncongenial political climate, hike in the lending rates by the financial institutions and the impact of the hike in the corporate tax and reduction in the depreciation rate. The recent rise in prices has indeed been very sharp. Going by the high bid/ask rates the technical position of the market is becoming increasingly suspect. When the market will pause to allow technical forces have their full play is anybody's guess.

TABLE 1
(Per cent)

| | BSE Sensitive | National |
|---|---------------|----------|
| Rise from January low till June end | 34.0 | 28.0 |
| Rise during July | 32.2 | 28.2 |
| Rise between July 22 and 29 | 15.4 | 13.1 |
| Rise between July 22 and August 14 | 20.0 | 16.2 |
| August 14 high compared with October 9 high | +6.5 | 5.2 |

**AT ONE END IS A
32 BILLION DOLLAR
GLOBAL MARKET.***

**AT THE OTHER IS
ALSA'S WINNING
STRATEGY TO REAP IT.**

Alsa Marine And Harvester Limited, is a part of the Alsa group, that has explored non-traditional areas in construction and marine products. And has a good track record in both fields

Alsa Marine and Harvester Limited - exploiting the vast potential, the right way

In 1989, the global exports of seafoods was valued at US\$ 32 billion. As exports from India constitute less than 2% of global consumption, there's a huge market waiting to be tapped

An immense potential that Alsa Marine is all geared to exploit successfully. By using the right technological inputs, backed by meticulous planning and quality standards

Government incentive - the right backing

Marine products has been identified as a thrust area to accelerate foreign exchange earnings. The MPEDA and other allied Agencies are geared to help realise this inherent potential

Achieving quality - the right way

The result of state-of-the-art equipment, trained personnel, and value addition that underlines the emphasis on quality at Alsa has been remarkable. Alsa is firmly entrenched in the export market, with marketing tie-ups with some of the leading names in hard currency countries in Europe

Steady growth - the right way

With the modernisation and expansion programme in progress being the main objective of the issue, the benefits of improved sales and profitability will be almost immediate

Tax benefits

Under Sections 80B(1) for companies and under 80I and 80M to the shareholders

Easy liquidity

Listing at Madras and Bombay Stock Exchanges

Get a share of the golden harvest with a company that is moving in only one direction. Upwards.

ISSUE HIGHLIGHTS

- An existing profit making Company, engaged in processing and export of marine products and in aquaculture
- Established brand image in growing international markets and sustained customer support
- Operations are export oriented. Sales of Rs 2,184 Lakhs during 1990-91 expected to improve substantially in the near future
- Projects underway for modernisation and expansion with emphasis on value addition, with very short gestation
- Risk factors pertaining to raw material and foreign markets will have bearing on profitability
- Income tax benefits under Section 80B(1) to the Company and under Sections 80I and 80M to the shareholders as well as Wealth Tax Benefits to the shareholders
- Listing at Madras and Bombay Stock Exchanges

EXPLOITING THE WEALTH OF THE SEA. THE RIGHT WAY

**Issue opens on
5th Sept. '91**

Accent on Modernisation

TATA IRON AND STEEL (TISCO), the biggest private sector company in terms of assets and the second biggest in terms of turnover, suffered a setback in saleable steel production in the year ended March 1991. The adverse factors affecting production included disturbances disrupting the flow of raw materials to the steel works and the movement of finished steel from the plant and erratic power supply. Production of saleable steel at 1.9 million tonnes was lower compared to 1.913 million tonnes achieved in the previous year. The higher internal construction requirements for continuing large modernisation programme resulted in a decline in sales by 4,800 tonnes at 1.64 million tonnes as against 1.688 million tonnes in the previous year.

However, in value terms, the company's net turnover achieved a record figure of Rs 1991.54 crore, registering an increase of 8 per cent over the previous year. This was

mainly due to partial full year impact of steel price increases. Better product mix and production of value added items through conversion arrangements with rerollers also contributed to the increased turnover. Export earnings at Rs 207 crore showed a substantial improvement of 41 per cent over Rs 147 crore in the previous year in spite of a loss of Rs 65 crore worth of business due to the Gulf crisis. Steel and engineering exports witnessed an improvement of 67 per cent.

With an increase of 35 per cent, profits before tax scaled a new high at Rs 235 crore. Lower interest charges in 1990-91 were mainly due to the one time substantial interest payment on the fully and partly convertible debentures in 1989-90 as also on the total application money received on these debentures. The increase in profits after tax was only nominal at 8 per cent due to a phenomenal increase of 186 per cent in tax provision arising out

of restriction of depreciation allowance to 75 per cent of that claimable. Dividend on equity shares was raised to 31 per cent from 30 per cent in the previous year.

The company has undertaken a Rs 2,000 crore expansion cum modernisation programme. It includes a new one million tonnes per annum capacity blast furnace, one million tonnes capacity hot strip mill, power facilities to generate nearly 100 MW and a 1.73 million tonnes per annum cement unit. The blast furnace is expected to be commissioned during the first half of 1992. The cement plants which will be located at Sonadih in Madhya Pradesh and Jehobra in Bihar are expected to be commissioned by the end of 1992. The Steel Development Fund Committee recently auctioned a Rs 680 crore loan to partly finance the expansion scheme. With a view of providing additional working capital, the company extended the date of maturity of its 15 per cent secured non-convertible debentures aggregating to Rs 75 crore for a period of seven years beginning from September 17.

The funds flow during 1990-91 amounted to Rs 693 crore of which cash generated from operations formed 43 per cent. Of the remaining sale of investments accounted for 32 per cent and borrowing formed 24 per cent and the rest came by way of share capital issued on conversion. Nearly 94 per cent of the funds were utilised towards capital expenditure.

The company's effort towards conservation of energy yielded good results. Improvements in coke quality accompanied by higher sinter proportion in the blast furnace burden and increased blast humidification resulted in energy efficiency in blast furnace operation. Further, coal injection introduced in one blast furnace enabled replacement of scarce and expensive coke.

IISCO

Record Turnover

TATA ENGINEERING AND LOCOMOTIVE (IISCO) which emerged as the biggest company in terms of turnover in the private corporate sector in 1990-91 continued to maintain its market leadership in medium commercial vehicles (MCV) and light commercial vehicles (LCV). With a 17 per cent increase of 15 per cent in sales the market share in MCV rose to 71 per cent. Similarly with an increase of 62 per cent in the sales of LCV, IISCO achieved a market share of 35 per cent. Tata Mobile production also increased. Sales of spare parts for commercial vehicles registered an increase of 17 per cent. The

excavator division sold 217 machines against the production of 206 machines, resulting in a zero inventory at the end of the year

In value terms, net sales of the company showed a significant improvement of 30 per cent. Although there was a substantial increase in the cost of new materials (36.3 per cent), power and fuel (45 per cent) and labour (27.4 per cent) the company was able to maintain the overall expenses to sale ratio at 0.92:1.

Export earnings of the company including deemed exports, registered an increase of 28 per cent to Rs 131 crore in 1990-91. The company exported 4,420 vehicles against 3,529 vehicles in 1989-90. The company plans to export steel castings for excavators to its foreign collaborators Hitachi Construction Machinery, Japan from 1991-92. The company is a net foreign exchange earner.

Operating profits of the company increased by 37 per cent and profits before tax spurred by 58 per cent over the previous year. However, profits after tax moved up by only 38 per cent due to increase in tax provision. Improvement in operating profits enabled a higher interest coverage ratio of 4.54 in 1990-91 as compared to 3.68 in 1989-90. The company distributed a higher dividend of Rs 4 per share compared to Rs 3 per share in the previous year. However, the pay-out ratio, i.e., dividend as percentage of profits after tax, remained lower at 29.2 per cent compared to 30.5 per cent in the previous year, resulting in higher retention during the year under review.

The company continued its efforts to make improvements in the range of vehicles. The hydraulic excavator was upgraded with the introduction of the new 'FX' series with know-how from Hitachi. The range of earth moving equipment was widened with the launching of TWE 3036 Tata front end wheel loader. The company plans to rationalise its product mix of commercial vehicles to improve safety and fuel efficiency and lower emission levels. According to the company, modernisation and upgradation of technology was continuing to improve productivity and reduce cost through design and material optimisation. The launch of the new Tata Sport and Tata Estate is planned during the current financial year. The manufacturing facilities at Lucknow are expected to be commissioned by March 1992.

Funds flow during 1990-91 was estimated at Rs 391.21 crore. Funds generated from operations formed 50 per cent of the total, while the remaining were raised through sale of investments. As much as 63 per cent of the funds was utilised for working capital requirements while 25 per cent was used for capital expenditure.

BELLARY STEELS AND ALLOYS Towards Self-reliance

BELLARY STEELS AND ALLOYS, a mini steel manufacturing company, achieved significant growth in production and sales in the year ended March 1991. Production of billets reached 36,187 tonnes as against 28,110 tonnes in the previous year, indicating a growth of 29 per cent. Capacity utilisation increased from 59 per cent in 1989-90 to 75 per cent in 1990-91. Net sales registered an increase of 36 per cent. Despite an increase in the cost of raw materials (30 per cent), power and fuel (24 per cent) and labour (41 per cent), operating profits registered a significant improvement of 62 per cent. The company was able to reduce its expenses to sales ratio from 1.04:1 to 1.01:1 in 1990-91. Profits before tax and after tax grew phenomenally by 149 per cent and 191 per cent respectively over the previous year. The improvement in profits enabled the company to pay a maiden dividend at the rate of 10 per cent on equity shares.

There was a rise in the major profitability ratios. Gross return on investment increased from 4.88 per cent to 5.39 per cent while gross return on turnover improved to 5.27 per cent from 7.57 per cent. Turnover ratio remained almost steady at 0.65:1. Return on shareholders' capital was marked up from 14.04 per cent to 24.35 per cent.

The company depended heavily on imports for its raw materials. Of the total raw material consumption of Rs 19.92 crore, as much as 79 per cent was imported. According to the company, efforts are being made to maximise use of indigenously available sponge iron as a substitute for imported raw materials. The company expects to achieve 85-90 per cent capacity utilisation in 1991-92 and also to introduce high value added alloy steel.

The company plans to implement a coal-based sponge iron project with a capacity of 60,000 tonnes per annum with two kilns at an estimated capital outlay of Rs 45 crore. The project will not only ensure adequate supply of sponge iron but also save foreign exchange. The plant is scheduled to start production in October 1992. With the ladle refining facilities and the installation of the captive sponge iron projects, the company expects to show further improvements.

To augment long term resources for financing the sponge iron project and to meet working capital requirements and strengthen the capital base, the company proposes to enter the capital market during September-December with 14 per cent secured fully convertible debentures aggregating Rs 550.50 lakh on rights basis to

existing shareholders and also issue 14 per cent secured partly convertible debentures of the value of Rs 550.50 lakh.

Funds flow during the year was estimated at Rs 10.49 crore. External sources formed 80 per cent of this total. Interest coverage rates remained lower at 2.37 compared to 2.70 in the previous year.

IG Petrochemicals

IG PETROCHEMICALS (IGPL), a 100 per cent export-oriented unit promoted by Mysore Petro Chemicals, is coming out with a public issue of 1,06,10,000 equity shares of Rs 10 each at par aggregating Rs 1,061 lakh. The issue will open on September 9. The company is setting up India's largest phthalic anhydride (PAN) plant at Jalga in Maharashtra. With a licensed capacity of 45,000 tpa, IGPL will be the only international scale PAN plant in the country. IGPL has a technical and financial collaboration with Lurgi GmbH of Germany. Under the agreement, apart from participating in the equity of IGPL, Lurgi will also assure the export of IGPL's production for five years at prevailing international prices through an associate company Metallgesellschaft (Hong Kong). This five year arrangement is to the extent of 100 per cent in the first year and 75 per cent in the next four years with an option to extend it by another five years. IGPL plant will use the process developed by Wacker Chemie GmbH and licensed by Lurgi for the production of PAN. This is a low energy process for which Lurgi will supply a special catalyst developed by Wacker Chemie and which guarantees the purity of PAN at 99.85 per cent and a yield of 106 to 107 per cent of the feedstock. For the IGPL project, Lurgi has supplied the plant and equipment and provided the know how and basic engineering. The detailed engineering project management including supervision of construction is being provided at the site by Humphreys and Glasgow Consultants. Mysore Petro Chemicals (MPCI), a well established profit making company with its plant at Raichur in Karnataka is a leading producer of PAN in the country. In 1990, MPCI paid a dividend of 40 per cent. The company has a substantial share of the domestic market in the various application industries such as PVC, paints, varnishes, coating inks, dye intermediates etc. Since 1986, MPCI has made pioneering inroads into the export market too. The IGPL plant compares favourably with the average international plant size of 35,000 tpa. The size of the plant is important for economics of scale in the manufacture of PAN and has a direct bearing on its competitive strength in the world market. PAN is an essential industrial chemical used in the manufacture of plasticizers for PVC, cables, leather, cloth, flooring, tiles and

footwear etc. It is also used for manufacturing alkyds in the paint industry and the production of certain varieties of dyes and pigments. The international demand for PAN is growing steadily and IGPL does not expect any difficulty in marketing its product. The project implementation is in full swing and installation is expected to be completed by December. Allowing one month for commissioning and trial runs, commercial production is expected to commence in the first quarter of 1992. The total project cost is Rs 618.5 lakh with Rs 900 lakh as the promoters' contribution in the equity share capital. The present share issue is to meet a part of the project cost. Out of the issue, IGPL is making three preferential offers: Rs 98.05 lakh to the employees of IGPL and MPCI, Rs 106.10 lakh to the shareholders of MPCI and Rs 200 lakh to NRIs. The balance of Rs 618.5 lakh is being offered to the Indian public.

Chembur Patalganga Pipelines

CHIMBUR PATALGANGA PIPELINES (CPPL), a new company is entering the capital market on August 19 with a public issue of 1,48,151 lakh equity shares of Rs 10 each for Rs 481.50 lakh. The total issue worth Rs 870 lakh including shares worth Rs 388.50 lakh reserved for preferential allotment. The company proposes to undertake a project involving the laying of a pipeline from the refinery of Bharat Petroleum Corporation at Chembur for transporting naphtha to the petrochemical complex of Reliance Industries at Patalganga and another pipeline for transporting its turn stream. The pipeline route would cover a distance of approximately 5 km (each way) including a brief stretch of four kms. The total project is estimated at Rs 870 crore. This will be financed by the present issue of Rs 870 crore, contribution from financial institutions Rs 3500 crore from banks Rs 12 crore and uncured advances from Reliance Industries Rs 10 crore. The laying of the pipelines is in progress and the pipelines are expected to be completed by October. The company has entered into a charter hire agreement with RIL for transporting the feedstock through pipelines which is more cost effective. This agreement provides for the company to receive transportation charges per

tonne of feedstock through the pipelines. The company would also have an assured minimum revenue from RIL in case RIL is unable to make available adequate material for transportation.

Alsa Marine and Harvests

ALSA MARINE AND HARVESTS, an existing profit making company engaged in processing and export of marine products and in aquaculture, owns a processing plant near Visakhapatnam which is equipped for production of value added products. The farm near Nellore in Andhra Pradesh on 32 hectares of land is designed for semi intensive culture and its feed is captive produced, conserving a substantial amount of foreign exchange. The company operates leased processing plants at Calcutta, Madras and Cochin. It has captive back up power sources, insulated vans and quality control facilities. The company now proposes to take up an integrated expansion and modernisation programme in two stages with the accent on consolidation and value addition. The first phase of the programme comprises modernisation of the processing facilities near Visakhapatnam, expansion of the aquaculture farm near Nellore and setting up of a new processing plant in Calcutta while under the second phase the company proposes to expand the area under aquaculture by about 150 hectares with a captive hatchery and feed plant. The projects covered by phase one have a very short gestation period inasmuch as they are expected to be completed by the end of this month. That under phase two is scheduled to be completed in January 1992. The estimated project cost is Rs 662 lakh. To finance in part this programme, the company is entering the capital market with a public issue of 20,70,000 equity shares of Rs 10 each at par aggregating Rs 207 lakh. Of this equity shares of Rs 20.69 lakh are earmarked for employees. According to Aliya Pasha chairman, the company was the first to export IQF (individual quick freezing) shrimp and cooked shrimp from the east coast and for the year ended March 1991 the value added exports accounted for about 20 per cent of the total sales of Rs 2184 lakh and this is targeted at more than 50 per cent for the current year. The subscription list will open on September 5.

Students' Rights

A G Noorani

A recent Supreme Court disposition clarifies some legal issues regarding the rights and duties of students and educational institutions and is an addition to the growing corpus of case law on the subject.

THE steady march of case law has resulted in a solid corpus of case law on the rights and duties of students and educational authorities. The Supreme Court's judgment on March 12, 1991 in Maharashtra State Board of Secondary and Higher Secondary Education versus K S Gandhi and others is the latest pronouncement of the court which explains the legal position clearly.

It concerned the secondary exams in March 1990. After the valuation of the answer sheets by examiners, random counter-check by moderators and recounting at the board, the moderators' mark sheets were sent to Pune for feeding the computer to declare the results. It was discovered that the moderators' mark sheets relating to 238 examinees, including 53 respondents in the appeal decided by the Supreme Court, had been tampered with. In consequence 214 examinees who were otherwise to fail would pass while 69 would improve their ranking. The results were withheld. An inquiry followed. Show cause notices were issued to the students in which the facts were fully recited and inspection of the papers was also offered. They were also offered an opportunity of being heard which included the rights of cross examination and of adducing evidence in defence. The candidates appeared before the inquiry officers.

The inquiry was a detailed and thorough one with questionnaires and the rest. The officers submitted their reports to the board whose standing committee decided to withhold the declaration of the results of the students concerned and to debar the 238 students from appearing in the supplementary exams in October 1990 and March 1991 as a measure of punishment. The Bombay High Court, on a writ petition, quashed the notification which announced this decision.

On appeal, a division bench of the Supreme Court consisting of justice N M Kashiwal and K Ramaswamy, set aside the Bombay High Court judgment and order. The key question in the case was the nature of the enquiry that was necessary in law in such a case. It was argued that the students were minors and had no assis-

tance in their defence from their parents or advocates. However, all the students had admitted that there was tampering and its benefit accrued to them. Only, they denied their own or their parents' complicity. The Supreme Court held that circumstantial evidence proved the guilt and the enquiry was adequate. The courts' jurisdiction in such cases is purely supervisory to see that the inquiry was fair and the rules of natural justice were observed. But the courts cannot sit in appeal on the facts and evaluate the evidence for themselves as the Bombay High Court had done.

This exposition of the law applies to all domestic or private or departmental inquiries. The court's exposition therefore deserves to be quoted in full.

It is well settled law that strict rules of the Evidence Act, and the standard of proof envisaged therein do not apply to departmental proceedings or domestic tribunal. It is open to the authorities to receive and place on record all the necessary, relevant, cogent and acceptable material facts though not proved strictly in conformity with the Evidence

Act. The material must be germane and relevant to the facts in issue. In grave cases like forgery, fraud, conspiracy, misappropriation, etc, seldom direct evidence would be available. Only the circumstantial evidence would furnish the proof. In our considered view inference from the evidence and circumstances must be carefully distinguished from conjectures or speculation. The mind is prone to take pleasure to adapt circumstances to one another and even in straining them a little to force them to form parts of one connected whole. There must be evidence direct or circumstantial to deduce necessary inferences in proof of the facts in issue. There can be no inferences unless there are objective facts, direct or circumstantial from which to infer the other fact which it is sought to establish. In some cases the other facts can be inferred, as much as is practical, as if they had been actually observed. In other cases the inferences do not go beyond reasonable probability. If there are no positive proved facts, oral, documentary or circumstantial from which the inferences can be made the method of inference fails and what is left is mere speculation or conjecture. Therefore, when an inference of proof that a fact in dispute has been held established there must be some material facts or circumstances on record from which such an inference could be drawn. The standard of proof is not proof beyond reasonable doubt 'but' the preponderance of probabilities tending to draw an inference that the fact must be more probable. Standard of proof cannot be put in a straitjacket formula. No mathematical formula could be laid on degree of proof. The probative value could be gauged from facts and circumstances in a given case. The standard of proof is the same both in civil cases and domestic enquiries.

Right to Work: The Why and the Wheretofore

Arun Ghosh

'Right to work' is not a laughable concept. It can and must be implemented. But it calls for certain pre-conditions, the most vital of which is democratic decentralisation, introduction of panchayati raj and the devolution of socio-economic development authority to democratically-elected local bodies.

THE other day, I ran into a distinguished economist—in fact, one of the most distinguished in the country—for whom I have high regard. I felt flattered when he said he had read the pieces on the Eighth Plan—spread over January 19 May 11—in these columns, and I was pleased when he told me that he generally agreed with the Eighth Plan approach and proposals outlined therein. But there was a snag. He did not believe in the recommendation regarding the right to work. In fact, he was totally opposed to the concept in principle. And where we met, there was no opportunity for discussion.

Essentially, the right to work implies that every adult citizen should have the right to do physical labour for eight hours per day at the minimum wage. In that sense, it is akin to the Maharashtra's Employment Guarantee Scheme (EGS). It does not mean that every citizen would be entitled to demand government employment nor employment of his choice. It does imply though that throughout the country, every citizen should have the right to earn the minimum wage by providing eight hours physical labour within a reasonable distance from where he lives.

Why do we need the right to work? Apart from the considerable underemployment that exists today, there is also increasing unemployment of the overt type. According to the 1987-88 NSS, visible unemployment was roughly 6 per cent of the workforce in rural areas and as much as 9 per cent in urban areas. In the latter case, much of this unemployment pertains to the educated unemployed, and the unemployed in this instance may not necessarily qualify for assistance under the scheme. For them, one has to think of alternatives, for the growth of the educated unemployed is a grave potential threat to the harmonious working of the economic system. However, a section of the urban unemployed also consists of landless rural labour flocking to neighbouring towns in search of employment.

Apart from overt 'unemployment', there is also considerable underemployment/low productivity employment. In part, this is a result of the inadequacy of

organisational support for traditional crafts for the artisan, the handloom weaver. This class of producers is denied credit, has little access to raw materials, and has now to face competition of mill output where the latter has the facility of subsidised credit, infrastructural support, and other advantages—all provided at the cost of the taxpayer. To digress for a moment, the volatilities of the 'modernisation' of the economy must be reminded that they should be made to pay for 'social security', which means a straightforward dole to the unemployed. On the other hand, certain shifts in policy can provide employment opportunities to the artisans in their traditional crafts and enable them to compete. But we would never bother to even consider these shifts in policy unless we are faced with the reality that in the absence of worthwhile self employment, these millions of craftsmen would, under the right to work, be knocking at our doors and demanding work at the minimum wage. So the right to work is necessary even to force us to change some of our policies, and such right has to be accompanied by measures which will help a vast majority of self-employed people to continue with their vocations at a higher level of productivity and income. But this is to anticipate the discussion that will follow. There are other pre-conditions to the successful implementation of the right to work.

It is important to go back to the need for a guarantee to the right to work. As per a detailed state-wise study based on consumption expenditure in the rural areas as obtained from the NSS, B. S. Minhas has found that in 1987-88, some 43 per cent of the rural population was below the poverty line (nailing the error in the Planning Commission estimates—based on a scalar up gradation of the consumption of all categories of households, using the quotient of the difference between the NSS estimates of household consumption and the CSO estimates of private consumption wherein the break-up of the urban, rural distribution of output is also highly arbitrary). Indeed, Minhas has written extensively on the er-

roneous methodology used in framing the Planning Commission estimates, and this point need not delay us here.

The brief point is that the extent of poverty in rural areas, even as late as 1987-88 (40 years after independence) should be unacceptable to any society. The other stark reality is that 70 per cent of the people below the poverty line are concentrated in eight states, where agriculture is rain fed, where the degradation of the land—arising from a variety of reasons—has reached dismal proportions, and where the productivity of farm labour therefore is quite poor.

How will the right to work help in the above situation? There is need for massive investment in infrastructure for the rural areas, for land levelling, for contour bunding, for tree planting for small (or minor) irrigation works depending on the topography of each area—a small check dam or weir here, a pond there, the restoration of past works which have fallen into disuse, the planting of grasses on the slopes to prevent soil erosion and the formation of gullies, and to generally improve the moisture retention capacity of the soil where the rain gods oblige by a downpour lasting only over two or three months. There are so many other types of rural infrastructure that we need: all-weather roads to every village, school buildings, buildings for health care, et al. We urbanites, especially those living in New Delhi or Bombay, seem to forget that now, with television reaching out to distant parts of the country, the social awareness and the resentment of large sections of the population are beginning to create tensions which are now a threat to our very survival as a nation state. No forces of 'internal security' can keep this upsurge down; in fact, we are wasting our resources on both defence and internal security, when the real problem lies with the distorted development, the increasing inequality of income, the social inequities, in fact, the abysmal conditions under which large sections of the population live.

We keep talking of the need to raise the productivity of labour. How can one expect eight hours of hard physical work from people suffering from malnutrition, and probably also some wasting disease because of the dirty, polluted water they have to drink? How can we expect skills to develop when most of the deprived sections of the population are uneducated? We talk of low labour productivity, but never about poor management of our factories. Indeed, the management of the economy leaves much to be desired, because our policies tend to neglect the welfare of the majority of the population.

The upper crust of Indian society has ensured its welfare—no matter what the

rate of inflation—through the Fourth Pay Commission. The cost to the nation by way of increases in pay and dearness allowances of the civil servants, employees of public enterprises and universities, colleges, and officially-aided schools, exceeds by a fair margin, the likely cost of a nation-wide employment guarantee scheme. And if one were to consider the 'covert' subsidies enjoyed by the affluent sections of the population (see, in this context, Mundle and Rao in *EPW*, May 11), the total amount of such subsidies would be several times the amount required for the implementation of an employment guarantee scheme. For us, the beneficiaries of the development programme initiated in the country in the fifties, opposition to the Employment Guarantee Scheme smacks of:

The simple plan,

That they shall have who have the power,

And they shall keep who can

And, it is not as if we need to create infrastructure only in the rural areas. Apart from a very few towns—New Delhi, Bombay, Bangalore, Hyderabad, and maybe a few other cities—the urban amenities available are pitiable. Even in these metropolitan areas, there are large sections of slum- and pavement-dwellers. What we need is a 'continuum' of prosperous villages, vibrant smaller (mandi) towns processing the agricultural produce of the neighbouring villages, and prosperous industrial townships. This would again require a lot of labour.

There is need for the deployment of labour for the improvement of both rural and urban infrastructure. And with a large population of unemployed and under-employed persons, if we cannot deploy this labour force to change the face of the country, we are poor managers of the economy, no matter how reputed we are in the international community in neo-classical economics.

And therein lies the problem. For too long we have tried to manage everything from Delhi. We have never considered the need to decentralise. But New Delhi cannot operate an all-India employment guarantee scheme. Even the bold initiative taken by Maharashtra indicates that we cannot take on such responsibilities, with full success, even at the state level. We need to decentralise further. We need to entrust the task of local development to the people. This means, we must firmly establish and strengthen the process of democratisation through the panchayat system (in rural areas) and municipalities (in urban areas). There must be some ground rules for the democratisation of the system. There must be regular elections to the panchayats; there must be periodic meetings of the gram sabha wherein all adults in the village (or cluster of villages) will be members; all major decisions shall be ratified by the gram

sabha; all decisions taken by the panchayat samitis (at all levels) must be displayed prominently on the notice boards of the panchayat offices; and the panchayats must be assisted by all the scientific inputs that we have at our command.

The only way the right to work can be translated into reality (in the rural areas) would be to take up local 'watershed area planning', which in most parts of the country would require considerable input of physical labour. The planning effort would require the help of civil engineers, land use experts, geologists, agronomists, maybe other experts. Such effort can be considerably aided by satellite imagery and aerial photographs. In 1990, it was estimated that an expenditure of Rs 100 crore would be enough to provide for the 'mapping' of the entire country through satellite imagery and aerial photographs. We already have a number of central government agencies doing this work; and the results are invariably demonstrated in New Delhi, to diverse groups of officials. What we need is to reach these maps to the local authorities, to help them plan better (In fact, satellite imagery pinpoints even the areas where subsoil water is available, or where shoals are emerging in rivers/oceans.)

So, the first pre-requisite to operating an employment guarantee scheme is decentralisation. And the only way to have democratic decentralisation is to foster the panchayat system. Rajiv Gandhi talked about it. V P Singh talked about it. Somewhere down the line, both Chandra Shekhar and P V Narasimha Rao appear to have given the go-by to the concept, even though, the Congress ostensibly swears by Rajiv Gandhi's policies. The current priorities are different. We have to have an IMF loan to continue 'business as usual' for the next few years. And the reduction of the fiscal deficit and fundamental trade reform are two of the main planks of IMF 'conditionality'.

Kirit Parikh, in an article in *The Economic Times* recently suggested that we give a try to trade reform, but that such a policy must be accompanied by an employment guarantee scheme. And, in his view, the EGS can be implemented by cutting down the many implicit subsidies we today extend to the affluent sections of the people.

The present discussion is not on all the policies that the government of India should pursue. It is limited to the issue of the 'right to work'. The brief point that is, that the right to work (or its variant, the EGS) can and should be implemented. But it calls for certain pre-conditions. The first is democratic decentralisation, introduction of the panchayat raj, and the devolution of socio-economic development authority to democratically-elected local bodies. There would arise the need

to also devolve the funds required by the local authorities to implement the EGS, and to use the EGS as a means of local area development. In two or three years, as the effects of such area planning begin to bear fruit, there will arise opportunities of productive employment on the farm, processing of farm produce, dairying, poultry keeping, sericulture, handloom weaving, and a hundred other vocations.

In 1990, it was estimated that on an all-India level, the cost of the EGS may be around Rs 13,000 crore per annum (at 1989-90 prices). Over the Eighth Plan period, a sum of Rs 65,000 crore would have sufficed. In fact, gradually, the pressure on the EGS should come down. Today, the amount required—at current prices—may well be much higher, may be some Rs 16,000 crore or more per annum.

But what is the amount we are spending on covert subsidies for the affluent? On defence? On internal security? And what is the total amount we are spending on centrally-sponsored schemes? The latter alone is close to Rs 5,000 crore per annum. That amount, if devolved to the local panchayats, would lead to more efficient use of the funds. It is a commonplace about public finance that taxes are best collected centrally; the delivery of social services is best organised in a decentralised manner.

So, part of the funds required for implementing the right to work can come merely by rearranging some of the present transfers. What we need to do is to convert such transfers/subsidies (like JRY, IRDP) into investments. For the rest, the balance of the funds can come from cuts in the covert subsidies to the affluent sections of the population. And the reduction in the fiscal deficit can come from the tempering of outlays on defence and internal security, together with improved tax collection and higher taxation of elitist consumption goods.

The right to work is not a laughable concept. It is a concept which needs to be set out as one of the major tasks of the government. It is a concept which, if implemented properly, can change the face of the country. It is a concept which requires both courage to implement, and sagacity in regard to the manner of its implementation. After all, the NREP and the RLDP, and latter the JRY and the NRY, were all intended to partially solve the problem of rural/urban unemployment. But (a) half-hearted measures would not do; and (b) the scheme cannot succeed if it remains a centrally-sponsored scheme. We need to decentralise.

And since India is essentially a federal entity, the unity and integrity of the country—a pet catchword of all politicians—can be maintained only by democratic decentralisation of the body politic, of the devolution of the requisite funds for local area development planning, to be implemented through the EGS.

Lok Sabha Elections: Message from Bihar

Indu Bharti

Though the country may be suffering from a fractured polity characterised by cynicism, confusion and a tendency for the voters to get swayed by non-issues, the people of Bihar chose in the recent Lok Sabha elections to vote on real issues which affect their day-to-day lives and accordingly gave a clear mandate to the NF-Left combine

THE 1991 Lok Sabha elections in Bihar will be remembered as a watershed. Not because of the countrywide headlines about the highly exaggerated allegations of electoral malpractices and violence. And certainly not for the headlines concerning the Election Commission's (dubious) activism in the state. But for the crucial message hidden in the election results which was not headlined: indeed was ignored by the media. The crucial message is that even though the country may be suffering from a fractured polity characterised by cynicism, confusion and a tendency for the people to get swayed by non-issues, the people of Bihar have chosen to vote on real issues which affect their day-to-day lives and accordingly have given a clear cut mandate to the NF-Left combine. The results show that not only did the pro Congress(I) and pro BJP wave sweeping northern and southern India stop at the borders of Bihar, but also that the people of the state, though suffering from economic deprivation and social backwardness for long, are more mature than those in other parts of the country when it comes to politics. For not only did the electorate in Bihar reject the communal appeals of the BJP and the Congress(I)'s notion of stability but it was also not swayed by the latter's attempts to make electoral capital out of the assassination of its leader. This is evidenced by the voting pattern in Bihar as shown in Table 1.

Only 17.6 per cent of the voters who cast their votes preferred the BJP and thus the party which had increased its share of the votes by 9.7 per cent at the all India level could register in Bihar an increase of 5.9 per cent only over its share of the votes in the 1989 polls. The Congress(I) suffered a 5.5 per cent erosion in its share of the votes as compared to a decline of only 1.8 per cent at the all India level.

The NF-Left combine polled 47.4 per cent of the votes and was thus well ahead of even the combined vote share (40.2 per cent) of the Congress(I) and BJP. The NF-Left combine suffered an erosion of 3.6 per cent in its share of votes in Bihar but this was markedly lower than the all

India erosion of 5.5 per cent. The combine suffered. But since the 1991 figures concern only 47 constituencies and the electoral process for seven more, involving around 13 per cent of the electorates, six of which happen to be NF-Left strongholds, the share of NF-Left votes is bound to go up.

The rejection of the Congress(I) and the BJP was also reflected in the fewer number of seats won. The NF-Left combine has already won 42 out of 48 seats for which results have been declared, while at Munger also the CPI candidate has emerged on top at the end of counting though the Election Commission has not yet declared the result. The BJP has won only five seats and came second in 15 others. The Congress(I) has just managed to open its account with one seat and came second in 23 others. The party wise tally is given in Table 2.

The NF-Left combine lost three of the seats won in 1989 but gained four new seats in this election. The Congress(I) lost all the four seats it had won in 1989 but gained one seat. Buxisarai where repolling was held in as many as 56 booths in the second round of polling. The BJP lost as many as six of the nine seats it had won in 1989 and as and when elections for two other seats won by it i.e. Patna and Gaya are held it may turn out to have lost as many as eight. The IPI lost the lone Arrah seat it had won in 1989 and gained none (Table 3).

The debacle of the non NF-Left parties is reflected in the larger number of security deposits forfeited as well. The Congress(I) forfeited its security deposits in over 30 seats while the BJP had to suffer this ignominy in around 40 seats. The Samajwadi Janata Party (SJP), which had fielded some of its stalwarts from Bihar, ended up losing the security deposits of 50 of the 52 candidates fielded by it.

This kind of results cannot be explained away by allegations of booth capturing, misuse of state machinery or caste politics as has been sought to be done in the popular media. These election results in fact provide a clue to an understanding of the complexities of a polity in transi-

tion. Bihar is a state where caste and class are almost synonymous and class-caste divisions have been sharpening due to a variety of factors. The economy and society of the state are largely agrarian and are characterised by wide inequalities, exploitation and oppression. More than one-third of the workforce here does not get even what is needed to keep body and soul together and around 50 per cent of the people survive below the poverty line. At the time of independence Bihar was fourth in terms of per capita income, but today it is at the bottom, below even Arunachal Pradesh, and its per capita income is not even half the national average. The dominance of the upper castes in every walk of life is complete. The fight of the underprivileged to undo the wrongs done to them by the ruling classes has been waged at two levels. While the middle peasantry/middle castes have been fighting the upper caste landlords, the dalit agricultural labourers have been fighting both since they are exploited by both.

During the 1989-90 elections the people fed up with the long spell of Congress(I) misrule had elected the non Congress(I) parties. But after the NF government's fall over the question of reservation for central government jobs and its firm stand on the question of secularism, the NF-Left parties decided to make the question of social justice the main plank of their election strategy. To avoid any split of the non Congress(I), non BJP votes they arrived at a complete seat adjustment: the Janata Dal got 37, the CPI 8, CPI(M) 2, the MCC 1 and JMM 6.

The NF-Left combine's slogan of social justice, though painted in the media as the Janata Dal's attempt at dividing the state on caste lines, proved to be a hit with the people for a variety of reasons. In Bihar the middle and backward castes have been fighting against their oppression and exploitation from the days of the Triveni Sanstha in the 1920s and 30s and a section of the middle castes which by the 60s had emerged as the new rich class has been striving since then to replace the upper caste feudal lords as the ruling class. In the late 60s they had a taste of power with the formation of a non Congress coalition government in the state. But the upper caste dominated bureaucracy did not let it function for the full term. When they again got a government of their choice in late 70s they fought for a larger share in the bureaucracy and, after a protracted battle, the karpoori formula was devised which provided reservation in state government jobs to these caste groups and to women and economically backward upper castes. The next step for them was to increase their share in central govern-

ment jobs and for this they have been fighting ever since the Mandal Commission recommended reservation in central government jobs for the backward castes. The Congress(I) and the BJP, supported by the media, tried their best to create an impression among the Kurmis and Koeries, the two middle castes which, like the Yadavs have become prosperous in some parts of the state, that the Janata Dal was basically a Yadav party and that their interests could not be protected by it. To woo the non-Yadav backward votes they even gave a larger share of party tickets to these castes. While the JD had given about one-fourth of its tickets to Yadavs, the Congress(I) gave only 9.3 per cent to Yadavs, and 16.6 per cent to non-Yadavs, the BJP gave 14.8 per cent to Yadavs, and 16.7 per cent to non-Yadavs (see *EPW*, June 1-8, 1991, p 1377). But these attempts to split the middle caste votes and woo the non-Yadav castes failed and the polarisation of the backward classes in favour of the NF-Left combine was complete.

Equally sharp was the drift of the forward castes away from the NF-Left. The urban middle class, consisting of government employees, intellectuals and professionals, has tended to change its loyalties depending upon immediate issues. In 1989, as in 1977, it had overwhelmingly voted for Janata Dal and BJP candidates. But this time the majority of them turned away from the JD due to what it perceived as the 'mandalisation' attempts of the JD. Only the liberals among the upper castes, who have been steadfast supporters of non-Congress, non-BJP parties and secular elements, remained with the NF-Left combine.

The beneficiary of this drift away from the NF-Left was the BJP which has given as many as 45 per cent of its tickets, the largest share among all the parties, to the forward castes and which has emerged as the new darling of the middle class. The remote chances of Congress(I) forming the government at the centre and the Hinduisation campaign of the BJP convinced the caste Hindus that their interests could be better protected by the BJP. And so the caste Hindu voters of Congress(I) also drifted away from it and adopted the BJP, while the forward caste supporters of JD, enraged at the NF government's decision to implement the Mandal Commission's recommendations, had already adopted the BJP. And so the share of BJP votes increased while that of Congress(I)

declined as seen above.

But despite an almost 6 per cent increase in votes it lost six of the nine seats it had won in 1989 and could retain only one, Khunti, while elections in two others, Patna and Gaya, have been countermanded. In this election the BJP in Bihar has been confined to south Bihar, winning Dhanbad, Ranchi, Khunti, Lohardaga and Palamu. Out of these, it could wrest the Dhanbad seat, from where it had fielded Rita Verma, wife of the slain S P Randhir Verma, defeating the MCC candidate, A K Roy, only because the JMM had also put up a candidate, violating the seat adjustment under which the Dhanbad seat had been given to Roy. Similarly, the BJP could win the Palamu seat because the IPF, which was left out of the NF-Left combine, also had a candidate there so that the entire Left votes did not go to the NF-Left combine's candidate. BJP's success from three other seats, namely, Ranchi, Khunti and Lohardaga was largely because of the poor organisation of the JMM which worked to the disadvantage of the NF-Left combine's candidate and it is entirely baseless to say that the BJP owes its success in south Bihar to the slogan of Vananchal which has proved to be a hit with the tribals.

Tribal votes, however, did play a crucial role in the success of the NF-Left combine. The slogan of social justice not only promised the end of brazen exploitation and oppression of the tribals but also the fulfilment of their long-cherished desire of having a state of their own, since all the constituents of the NF-Left combine, barring the CPI(M), which in any case does not have any presence in tribal Bihar, had endorsed the demand for a Jharkhand state. The result was that the JMM, fighting this election as an NF partner, achieved complete success and all its six candidates won by handsome margins. It wrested the Singhbhum seat from the Congress(I). The biggest success of the JD-JMM-CPI alliance was, however, seen in Hazaribagh from where the BJP MP, Yadunath Pandey, notorious for his role in communal riots, was defeated by the CPI candidate. This was possible only because of the backward, Muslim and secular upper caste votes together with the tribal votes.

The issue before the Muslims in this election was clear. On the one hand was the chimera of stability promised by the Congress(I), a party which though it pro-

fesses secularism has a communal record no better than that of the BJP, and the spectre of being relegated to the status of second rate citizens in the Hindu nation of the BJP. On the other was the NF-Left combine the secular credentials of which were truly unblemished and which had given 15 per cent of its tickets to Muslims against 11 per cent by the Congress(I). And its slogan of social justice promised a continuance of the secular structure of the polity and society in which Muslims would have a status on par with the majority community. The fact that the Janata Dal government in the state took a firm stand on the communal question and prevented any major communal flare-up even as neighbouring UP was being ravaged by communal violence and the courage it showed last October in arresting L K Advani and thus stopping his campaign for Hinduisation of the polity had further strengthened the secular credentials of the NF-Left combine in the eyes of the Muslims. So they voted *en masse* for NF-Left candidates.

In the Janata Dal's scheme of social justice, however, there is apparently no place for crucial issues like land reforms and payment of minimum wages—issues which concern the most underprivileged, exploited and oppressed sections of the society, i.e., agricultural labourers who belong to the dalit castes. Nowhere in the election campaign were these issues or for that matter that of massacres by landlords raised by JD candidates and leaders. In fact the Janata Dal and Left parties did the opposite. Ramakhan Singh Yadav, the man behind the Tiskhora carnage, was given a JD ticket from Arrah by chief

TABLE 2: FINAL TALLY

| Parties | 1989 | 1991 |
|-------------|------|------|
| Janata Dal | 31 | 28 |
| JMM | 3 | 6 |
| CPI | 4 | 8* |
| CPI(M) | 1 | 1 |
| MCC | 1 | — |
| IPF | 1 | — |
| BJP | 9 | 5 |
| Congress(I) | 4 | 1 |
| Total | 54 | 49** |

Notes: * Includes Munger where at the end of counting, the CPI candidate stood much ahead of his nearest rival. The Election Commission is yet to officially declare the result.

** Election to five constituencies countermanded.

TABLE 1: PERCENTAGE SHARE OF VOTES POLLED

| State | NF-Left | | | BJP | | | Congress(I) | | | Others | | |
|-----------|---------|------|--------------|------|------|--------------|-------------|------|--------------|--------|------|--------------|
| | 1989 | 1991 | Change (+/-) | 1989 | 1991 | Change (+/-) | 1989 | 1991 | Change (+/-) | 1989 | 1991 | Change (+/-) |
| Bihar | 51.0 | 47.4 | -3.6 | 11.7 | 17.6 | +5.9 | 28.1 | 22.6 | -5.5 | 9.2 | 12.3 | +3.1 |
| All-India | 34.2 | 28.7 | -5.5 | 11.5 | 21.2 | +9.7 | 41.6 | 39.8 | -1.8 | 12.7 | 10.3 | -2.4 |

Note: 1991 figures for Bihar are based on figures for 47 constituencies.

minister Laloo Prasad who also solicited the assistance of Jwala Prasad, the notorious Rajput landlord of Bihta who is the main accused in a number of cases of massacres of poor labourers

The IPF and various factions of the CPI(ML) have done considerable work among the dalits. The benefits of their work, however, appear to have gone to Janata Dal candidates this time. And in many areas, where the dalits stood behind the IPF candidates, they were not allowed to vote. This was particularly so in the villages of central Bihar where IPF had put up a commendable performance in the 1989-90 elections. Previously it used to be the upper caste landlords who used to snatch the dalits' right to vote. This time it was the new landlords from the middle castes, the kulak lobby, which did this.

And this brings us to another message of the election results: the kulaks have finally replaced the feudal landlords as the ruling class in Bihar. In spite of the popular base of the NF-Left combine's victory, it is the richer sections of the middle castes, Yadavs, Kurmis, Koeries, etc., who are the dominant force in the Janata Dal and who with the slogan of social justice have been able to form an alliance with the middle peasantry, the overwhelming majority of whom happen to be their fellow caste men. A section of the erstwhile ruling class, the landowning class belonging to Rajput caste, has also allied with these sections. Since this alliance is secular in its outlook, it has been able to get the support of the minorities and the secular minded upper castes as well. And since the Janata Dal government in Bihar appeared to hold out the prospect of championing the cause of Bihar's neglect by the centre more effectively, a section of the upper caste intelligentsia also supported it.

The traditional Left parties, the CPI and CPI(M), may have gone for a common front with the NF at the national level due to other factors, but the complete seat adjustment that they forged with the Janata Dal in Bihar, even though it required the CPI to leave the prestigious and politically significant seat of Patna where its candidate had already filed his nomination papers and started campaigning, was influenced by the striving of the middle peasantry, which dominates the CPI, to ally with the richer peasantry in order to

further its own class interests. This is corroborated by the contrast in the CPI's stand over seat adjustment in two seats, Patna and Jehanabad. The CPI chose to leave Patna, where it lost by only about 25,000 votes in 1989 but which it had won as many as three times in the past, to the Janata Dal which had come fifth, even behind the IPF, and had not been able to even save its security deposit in the 1989 election. In sharp contrast, the CPI rejected the IPF's offer of forming a Left front first and then going for an alliance with the JD and JMM to form a broad Left democratic front. In the process, the CPI refused to leave the Jehanabad seat for the IPF. During the last Lok Sabha election the IPF had polled more than 1.5 lakh votes at Jehanabad and stood third behind the CPI, which had won the seat, and Congress(I). In the subsequent elections for the vidhan sabha, the IPF's share of votes increased further and its candidate won from one of the six vidhan sabha segments and stood second in four others while the CPI was relegated to third position. Had the CPI left the Jehanabad seat for the IPF and supported the IPF candidate from Arrah who had won the seat in 1989, the latter would have withdrawn its candidates from 14 other Lok Sabha constituencies. What is more, this would have led to the formation of a Left front in Bihar which not only would have been favourable for further growth of Left forces in the state but which would have been in a better bargaining position while negotiating for seat adjustment with the Janata Dal.

What prevented the CPI from doing so was the fact that the IPF champions the cause of the poorest sections of society whose interests in the immediate context are in contradiction with those of the middle peasantry which the CPI has come to represent and it was in the common interest of the CPI and Janata Dal to undermine the IPF. The election results however confirm that the IPF is a force to reckon with in Bihar. Though it lost the Arrah seat it had won in 1989, it was able to poll 1.16 lakh votes in Arrah and 1.13 lakh votes in Jehanabad. In three other Lok Sabha constituencies also, its candidates secured between 50,000 and one lakh votes.

The elections also showed that class consciousness has further developed and sharpened among the people in Bihar and

caste consciousness has taken a back seat. Contrary to the allegations that the Laloo Prasad government has divided the state on caste lines, people in constituency after constituency walked out of the caste barriers while exercising their franchise. For instance, in Sitamarhi all the Bania voters voted for the JD candidate belonging to the Yadav caste despite the fact that the Congress(I) had fielded a Bania candidate. At Godda the BJP had a Yadav candidate in Janardan Yadav, but all the Yadav voters voted for Suraj Mandal, a Bania by caste, of JMM. In central Bihar where Yadavs and Kurmis often fight violently while competing for supremacy, the Kurmis voted for Yadav candidates—for instance, in Nalanda. In Darbhanga the Yadavs voted for the NF-Left candidate, a Muslim, even though then central minister Hukumdeo Narayan Yadav was the candidate of the BJP. At Chhapra the JD as well as BJP and Congress(I) had Yadav candidates, but the Yadavs voted for the JD candidate.

Clearly, despite all the pre-poll forecasts of a split in the backward caste votes, there was complete polarisation of the middle and backward castes in favour of the NF-Left candidates, regardless of their caste affiliations. This does not however mean that voters of a particular middle caste necessarily voted for a fellow middle caste candidate. At many places they voted for upper caste candidates. For instance, the BJP had fielded a Yadav candidate at Banka, but the Yadavs voted for the Rajput candidate of Janata Dal. At Madhubani also the BJP had a backward caste candidate, but the backward votes went to the Brahmin candidate of CPI. Similarly in Shivahar, Maharajganj, Vaishali, Balia and Aurangabad, the middle and backward castes voted for NF-Left candidates belonging to the upper castes. In fact barring Rita Verma from Dhanbad, only those upper caste candidates won who were NF-Left candidates. Middle and backward castes voted for dalit candidates in the reserved constituencies in the same manner.

Voters also walked out of community barriers to vote for the NF-Left candidates. The classic cases are the Bettiah and Katihar constituencies. In these constituencies both the NF-Left and Congress(I) had fielded Muslim candidates and it was widely believed that the Muslim votes will split while there would be consolidation of Hindu votes in favour of the BJP so that its candidates would win. But neither such a split nor such consolidation took place and the Muslims, the middle and backward castes, the dalits and the secular upper caste voters voted *en bloc* for the NF-Left which won both these seats. Obviously the voters broke out of their caste affiliations and rallied behind JD-Left candidates because the combine, by espousing the cause of social justice, was expressing their class aspirations.

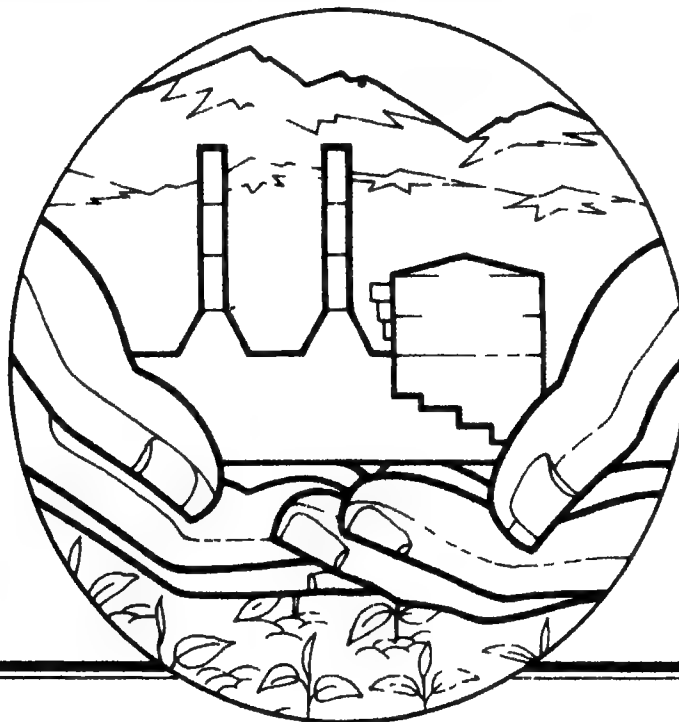

TABLE 3 SEATS GAINED OR LOST BY PARTIES

| Parties | Won in 1989 | Loss | 1991 Gain | Total Won |
|-------------|-------------|------|-----------|-----------|
| NF-Left | 40 | 1 | 4 | 43 |
| BJP | 9 | 6 | 4 | 5 |
| Congress(I) | 4 | 4 | 1 | 1 |
| IPF | 1 | | | — |

Note: Seats held in 1989 added to loss/gain in 1991 does not equal total seats won in 1991 because of the countermanded seats

Here is a plant
that promises prosperity

Invest in **SUNDERBAN FERTILIZERS LTD.**

SUNDERBAN FERTILIZERS LTD is setting up the largest and the most sophisticated Single Super Phosphate Plant in North Bengal

The plant will be the largest of its kind in the region with a production capacity of 66,000 tpa. There will be facilities for the granulation of 40% of the total production of SSP

The project is promoted by Shri Hardev Singh and Shri Narayan Chakraborty who have experience in relevant areas. The former MD of Fertilizer Corporation of India, Dr. K. R. Chakraborty is the technical advisor

The plant has an ideal location adjacent to the State highway at Kismet Sukharia Mouja, Dist. Jalpaiguri (A category backward district) in West Bengal. A ready market awaits in the entire North Bengal, North-Eastern region, Sikkim and North Bihar

Dharamsi Morari Chemical Co. Ltd., are the technical consultants and CMDC Design Pvt. Ltd., are the project consultants

The countdown begins for a green revolution

Public issue of 20,00,000 Equity Shares of Rs. 10/- each for cash at par aggregating Rs. 2 crores.

If the company does not raise the entire amount of Rs. 20 crores within 180 days of the date of the prospectus, the entire subscription will be refunded to the applicants within 30 days from the closure of the subscription. If there is any delay in refund of such amount by more than 10 days, the Company will pay interest at the rate of 15% per annum to the delayed period.

Issue opens on 29th August, 1991

ISSUE HIGHLIGHTS

- The only Single Super Phosphate Fertiliser Plant within a radius of 400 Kms
- Commercial production to commence soon
- Ready local market
- Tax Benefits - 80L, 80M, 88A (if applicable) and Wealth Tax Benefits to Investors
- Easy liquidity—Listing at Calcutta, Bombay and Ludhiana Stock Exchanges
- Risks perceived
 - Changes in Govt. policies on imports and subsidy
 - Adverse climatic conditions

Press Council Report on Army in Kashmir

Rita Manchanda

Even if the Kunan-Poshpara rape incident had been concocted and the "women tutored and coerced into making statements derogatory to their own honour and dignity", the Verghese Committee, which arrived at this conclusion, would have lent its investigation more weight had it displayed less of an overt bias towards the army version

THE army has effected a virtual coup in the latest Press Council report 'Crisis and Credibility' on Kashmir. They have got the country's ace liberal B G Verghese to give a clean chit to the army and in passing, to the paramilitary forces in the valley. Editorial writers have hailed it for exposing as a 'massive hoax' reports of army excesses and atrocities in the valley. The Bharatiya Janata Party has demanded an apology from the doyen of the civil libertarians justice V M Tarkunde for supporting anti-national elements in maligning the security forces in Kashmir.

Human rights groups are supposedly in the dock. And the adjudicator in this curious trial of human rights groups vs the army is B G Verghese. On the invitation of the army a three member committee was appointed by the Press Council to look into reports of army excesses. One member, the elderly journalist Jamna Akhtar Das was unable to travel to the valley and is not a signatory of the report. K Vikram Rao is cited as co-author of the report but as he is better known for his trade union proclivities rather than his journalistic activities it is evident that the report rests on the credentials of Verghese.

Most human rights groups would have described him as a sympathiser if not an activist. And Verghese now admonishes these groups for being duped by 'the say so of alleged victims and propagandists' masterminded by Pakistan. But as a far from demoralised V M Tarkunde retorted "is the report not also based on the say so of the army? Is it not equally one-sided?"

The report spans the period March 1990 to May 1991 and examines some half a dozen incidents of reported excesses. Verghese acknowledged that in the selection of the incidents he was influenced by the news clippings sent to the committee last winter. In addition the committee included the alleged Kunan Poshpara gang rape and the killings of infiltrators at Dudhi as they were seen as the most heinous examples of army excesses. Moreover, these had been given the maximum publicity, Verghese explained. Both were found to be without foundation.

Human rights groups are, however, a little sceptical about the choice of incidents. Why does Verghese or rather the army show no interest in such alleged incidents

of army excess as in Panzgam in Pulwama district on June 9 1990 or the rape and molestation of women in Kupwara town during a search and cordon operation on June 11 or the Trehgam incident on June 10, asks Dinesh Mohan of the Committee for Initiative on Kashmir. These have been well documented in the all women's committee report Kashmir Imprisoned published by CIK.

As for the killings of 73 'militants' at Dudhi near the line of control last May reports in the press had alleged that the youths had been massacred in a mass encounter or that these infiltrators had been killed when they could have been arrested. Suspicion was further fuelled by the fact that the bodies were not brought back to the valley. In an effort to defuse tension the high court asked the administration to publish their photographs in the local press. Modifying the order, the Supreme Court ordered that the photographs be displayed at offices of the district magistrate and police stations in the valley for inspection of relatives and friends from June 10 to 18.

Verghese unhesitatingly concludes on the basis of what the authorities disclose to him that the allegations were unfounded. Would he have been so certain if he knew that the advertisement alerting people about the photographs appeared in the popular Urdu daily *41 safa* only on June 14. Moreover according to a letter sent to the *TOI* (which was not published) and humoured by two residents of Srinagar the majority of the names of the dead listed indicated that they were from the Doda Kishtwar area of Jammu division a day's journey from Srinagar where 11 photographs were displayed. While night curfew is continuous on June 12 there was day curfew and on June 13 and 14 the civil curfew of the militants. June 15 strike by the state employees and June 16 was a Sunday. On June 18 the photographs were withdrawn. The people of Doda Kishtwar therefore, never had a chance to identify the photographs.

In the Kunan Poshpara incident 23 to 100 women were reported to have been raped by the army during a search and cordon operation last February. Verghese committee, however, found the charge of rape 'completely untrue'. Why? Because

of the delay in reporting the incident; the villagers having signed the NOC (no objection certificate) after the raid; the fluctuating number of rape victims, the inconsistencies in the testimonies of some of the villagers interviewed by the committee and finally, "would troops on a hazardous search and cordon operation in a village known to be harbouring militants nonchalantly spend the night carousing and raping?"

It is quite possible that the Kunan-Poshpara rape incident was concocted and the "women tutored and coerced into making statements derogatory to their own honour and dignity". But the Verghese Committee might have lent its own investigation more weight had it displayed less of an overt bias towards the army version.

Verghese chooses to dismiss the account of the JK police constable who accompanied the army party and that of the block medical officer who examined 32 women. He found injuries like abrasion on the chest and abdomen which however were attributed to the village folk hugging 'kangris'. Did the men have similar abrasions? Verghese says he never thought to inquire. The medical report says that in the case of the three unmarried girls their hymen was torn. But Verghese in a statement reminiscent of standard police style defence states,—"it could be the result of natural factors, injury or premarital sex".

In the report Verghese refers to a group of four to five young girls who were pointed out to the visiting committee as victims of rape. "They stood in full gaze of some young men idling nearby. They seemed quite unashamed to be lined up in public." Verghese stressed as if it clinched the lie of rape. They were very young girls victims of an incident that took place more than three months before. Does Verghese want to suggest that they the victims should not come out in public?

A massive hoax orchestrated by the militant groups and their mentors abroad is how the committee described the Kunan Poshpara rape. It is part of the sustained strategy by Pakistan to get the Kashmir issue inscribed on the international agenda when it has failed to do so on a politico-legal basis. "Otherwise why should the Srinagar based newspaper, *41 safa* in its May issue reprint an English report filed much earlier by UPI correspondent Ghulam Nabi Khayal along with a human rights group report also in English about an incident that took place in February." Verghese said waving the copy of *41 safa*. What the authorities forgot to tell Verghese was that *41 safa* regularly carries English language articles and editorials once a week.

It is no one's argument that there is not a propaganda war afoot in which human rights violations prominently figure. And clearly for Verghese the driving force behind his determination to counter

reports of human rights excesses is the "human rights conditionalities" the USA seeks to impose on India. "As a result of these reports the US Congress now dares to suggest that training in human rights must be made a part of the advanced training programme for visiting Indian defence personnel. At a recent seminar on Kashmir in Washington one English participant spoke about Kashmir being a colony of India," he said in an outraged tone.

But Verghese by jumbling together human rights groups of all hues, local, national and international does serious injustice. After all as Tarkunde at a recent press conference explained, on behalf of the Co-ordination Committee on Kashmir he had called for a judicial inquiry into Kunan-Poshpara rape and had himself not pronounced any judgment on it.

There is no denying that separating fact from propaganda in the valley is a daunting task for any journalist or human rights groups as was highlighted last month when militants of the Muslim Janbaz Force holding the two Swedish hostages staged an elaborate drama complete with photographs of one Swede wounded in the leg by the security forces.

As Srinagar-based correspondent Ghulam Nabi Khayal readily admitted, "there are only two ways in which you can go to the affected area, either the militants take you or the security forces". And reports appropriately reflect the bias of who escorts you. Besides, any local journalist who challenges the militants does so at enormous personal risk. *Al Safa* editor Shaban Vakil dared to criticise the militants and was executed.

Tarkunde too readily spoke of the limitations under which human rights groups operate. "Very often the other side refuses to talk to us," he said. He had no quarrel with the need for greater rigour in investigating human rights violations, especially in a situation where they are grist to the propaganda mill. But the press council report would have earned more credibility had it demonstrated a similar rigour in its own investigation into army excesses.

Other than Kunan-Poshpara, the committee did not bother to personally visit the scene of the other incidents of alleged excesses though its blanket judgment about the charges being concocted or grossly exaggerated remained unqualified.

Regarding the Pazipora rape incident of August 1990, the committee did not find the time during its two day visit to the valley to go to the area. Instead it juxtaposed the army's defence with a pastiche of news clippings, reports from national and international human rights organisations. Apparently the committee did not consider it necessary to read the integral text of these reports, relying upon the army's potted version.

Sukhmani Singh's report on the Pazipora rape in *The Illustrated Weekly* entitled, 'Protectors or Predators' is dismissed by the committee as many of the women

cited by her in the rape story did not exist. The alleged rape of Saba (26) described in the report is challenged because according to the army Saba is 45 years, denies being raped and her husband Ghulam Ahmed Bhat is alive. Had Verghese read the original story he might have seen that there were two Sabas, one a woman of 50 who was hit by the police but not raped and another Saba (26) whose husband was shot dead by the army before she was raped.

Sukhmani quotes a doctor in the Kupwara district saying that the five women brought to her from Pazipora "were all definitely victims of rape" and the cases registered with the police. But the doctor's evidence is held worthless because she had not prepared their medical reports even a couple of weeks later. Verghese who finds no difficulty in showing empathy towards the overstrained security forces, apparently did not think the doctor's comments quoted in Singh's article about feeling intimidated by the security forces was worth considering.

Verghese Committee made no effort to contact Sukhmani Singh. Quite inexplicably the committee refused to look at the reports of the human rights groups which it was so ready to castigate. "We offered him our reports but he ignored them", Tarkunde complained.

Overawed by the army opening up its barricaded archives, the committee was apparently prepared to accept without any crosschecking the army's version whether it was the Jengpora incident or the alleged firing by the army on demonstrators at Zakura in March 1990.

Although the committee refers to the account of the two incidents in the CIK's 'India's Kashmir War' Verghese does not appear to have read them otherwise he would be aware that despite the army's court of inquiry justifying the Jengpora incident as one in which an escort party fired in self defence upon a mob to ensure the safety of children in a school bus, "the government ordered registration of cases against the erring military personnel involved."

On the strength of eyewitnesses the CIK had charged that the army had fired on demonstrators who had been returning home in buses. The report of the army inquiry was described as false since all schools were closed in the valley and in any case there was no school near the spot of the firing. Since the school was open the Verghese Committee dismissed the report of alleged excesses. Verghese did not think it necessary to call upon the CIK and ask it to present its evidence.

Had he done so he might have found that the school had been opened in the morning to enable senior students to take their exams. According to the army version the two army vehicles were carrying 37 children of class I to X. The firing took place in the afternoon after 3 pm when the children would have all been back

home. Also people travelling from the topography of Srinagar argue that it is highly improbable that an army school bus bound for the Badami Bagh school would be moving towards Jengpora on the national highway leading to Baramulla.

Moreover, Radio Kashmir in its 745 news bulletin of March 1, 1990 made no mention of an army school vehicle or of a firing in self defence. Instead it refers to the army firing on a 'passenger bus'.

As for Zakura firing, the Verghese Committee claims that there is no police record of deaths whereas the CIK report cites an FIR Zakura police station made in the presence of M A Abbas, deputy commissioner, Srinagar (ARC-police no 89, 899204-Register No 2 Roznamcha, March 1, 1990, Thana Police Chowki, Zakura).

The press council report concludes that excesses where they have taken place have been inquired into and action taken. Yet its own annexure shows that court martials have been held in only seven cases and even in these 'severe displeasure' is the punishment even if it involves deaths in police custody. In an incident where rape is proven the JC (J) is severely reprimanded (i.e. loses three promotions) and the NC (N) and jawan dismissed.

The committee insists that its brief was limited to army excesses but as the 'faux' fighting a terrorist insurgency is indivisible, it briefly touched upon the paramilitary forces and pronounced "overreaction on occasion" towards or groups of men who go berserk under the strain. But what is the value of an assessment which relies exclusively on the version of the DCI, or DIG CRPI and BSI?

"The real excesses are committed by the paramilitary forces not the army", Tarkunde insists. But the Verghese Committee would have us believe that the reports are gross exaggerations. As an example he cites:

"In early 1990 when a certain incident that stirred great excitement was alleged in Srinagar, the governor Jagmohan issued a public notice asking for the names of those killed so that compensation might be paid to the bereaved families. There was no response. The alleged deaths were concoctions."

Surely we should be informed which incident is being referred to especially as it bears the burden of the judgment of gross exaggeration about excesses by the paramilitary forces. Was it the one in which the people of the valley publicly vowed not to accept any compensation from the state as a show of protest?

The report has become a convenient tool to pillory the human rights groups and columnists are full of righteous indignation at the "dirty tricks against the army". Would they be so strident had they actually read the rather bulky report? Who indeed has fallen victim to the 'say so' of the people or the army, the human rights groups or the Verghese Committee?

BJP's Changing View of Hindu-Muslim Relations

Kameshwar Choudhary

The BJP's position on Hindu-Muslim relations has undergone considerable metamorphosis in the decade of its existence with the Mandal agitation acting as a spur to its current phase of communal politics

WITH its inception in 1980 the Bharatiya Janata Party strove to distance itself from its progenitor, the Bharatiya Jan Sangh which was popularly known as a Brahmin Bania based political party. The BJP wished to spread its wings to cover all sections of the population and emerge as an alternative force in Indian politics. For this, it was essential to befriend the Muslims as well.

In the beginning the BJP laid some emphasis on fostering communal harmony and social cohesion. While elaborating its concept of 'positive secularism' in 1980 the party stood for "full protection of the life and property of the minorities" [1]. In his presidential address to the National Council (NC) of the party in 1982 Atal Behari Vajpayee advised the opposition parties to "resist the temptation of compromising with religious and communal fanaticism simply to get power. He asserted,

Only to the extent that we are able to insulate administration, politics and election from the corrosive influence of caste, community and creed would we be able to strengthen national unity.

Further, taking note of the communal violence in Baroda, Invadrum and Delhi the National Executive (NE) of the BJP passed a resolution on Communal Harmony and Social Cohesion in 1983. The NE stated that it was "seriously exercised over the growing communal and caste tensions in different parts of the country often leading to violence both against person and property. It held

No religion encourages or condones hatred or violence against one's fellow beings. A Hindu, Muslim, Christian or whoever maimed or killed is an Indian disabled or lost. Life and property lost is not just Hindu loss or Muslim loss but a national loss.

It was asserted that promotion of communal and social cohesion and harmony and protection of the weaker sections was to a member of the party, an article of faith. Moreover, the NE called upon every member of the party to strive, in particular, to

- (1) Keep a watchful eye on tensions building up or situations which were likely to endanger communal peace and harmony,
- (2) Take immediate and appropriate steps to defuse the tension and neutralise

the situation and
(3) Plunge courageously into the defence of the life and property of innocent people and make utmost personal sacrifice to this end [2].

In his presidential address to the NC session at Pune in 1984, Vajpayee noted the increasing number, frequency and intensity of communal riots in the country. He suggested that if communal riots were to be checked the present set up which is the root cause of politicisation of police and criminals' influence in politics would have to be changed. He added that strengthening the feeling of Indian nationalism in order to defeat communalism would also be possible only then.

Further in its Lok Sabha election manifesto of 1984 the party held

Unity in diversity has been the hallmark of Indian culture, which is a *unique multi-hued synthesis* of the cultural contributions made over the centuries by different peoples and religions (emphasis added).

It also asserted that "the very idea of a theocratic state is alien to Indian political history. It observed that in the Indian tradition the state has made no distinction between one citizen and another on the basis of his religion. Hence when India became independent in 1947 it was declared a secular state. Moreover the party made a pledge to guarantee all minorities linguistic and religious peace and security and full opportunities for progress and development.

With the Shah Bano case in 1985 the BJP started stiffening its stand towards the Muslims. In its resolution in January 1986 the NE of the party strongly condemned the virulent campaign launched against the Supreme Court by the Muslim League and the Jamaat-e-Islami following the court's judgment in the Shah Bano case. It affirmed that the verdict of the court was pre-eminently just and sensible. The NE rejected the Muslim League view that this judgment was an interference in the religious affairs of the Muslims. Moreover it held that the move to amend the law by the Rajiv Gandhi government to placate the Muslims was "retrograde, anti woman and a surrender to obscurantism and bigotry". Hence, the party demanded "the amendment pro-

posal be abandoned forthwith".

In his presidential address to the plenary session of the party in May 1986, I. K. Advani said that the Rajiv government had capitulated to "the vicious campaign unleashed by the Muslim League and Jamaat-e-Islami against the judgment" by introducing a bill in parliament to nullify the Supreme Court judgment in the Shah Bano case. He observed that the Muslim Women Bill ran counter to the Directive Principle of the Constitution (Article 44) enjoining the state to develop a uniform civil code, violated Articles 14 and 15 of the Constitution, and disrupted the existing uniformity in the field of criminal law. Moreover, Advani reiterated the earlier position of the party that "theocracy is alien to Indian political history". He stated that in the Indian tradition the state respected all religions equally (*sarva dharma sambhav*) and made no distinction between one citizen and another on the ground of religion. According to him the BJP subscribed to this positive concept of secularism. He added "communalism is bad, whether of the majority or of the minority".

DUAL STRANDS

In his presidential address to the NC session of the party in January 1987, Advani took pains to (mis)interpret Jawaharlal Nehru's idea of national unity and observed that the latter considered ancient (Hindu) culture as the 'substratum' for national unity without using the word Hindu [3]. As earlier he proclaimed that theocracy was alien to traditional Hindu polity. Moreover, he stated that

indifference to India's common culture on the one hand and a conscious pampering and promotion of a minority complex (by the Congress I) in the minorities on the other, had led to dangerous strains in society (emphasis added) [3].

Further Advani elaborated on the concept of 'minorityism' and hinted at its dangers. In this context he cited Gopal Singh who defined minorityism in broad terms in his work *India, My India* (1986). According to Singh

One would hate to live and participate in a society where one is condemned to the status of a permanent statutory minority for reasons only of birth and all that goes with it: religion, sex, caste, colour or place of birth within the same national home [3]. He proceeds

If the minorities start thinking and acting in communal terms the majority of necessity will also begin to think and act likewise. And the minorities in such a context will suffer the most, not the majority [3].

Advani summed up minorityism as 'promoting minority complex among the minorities serving neither national interest nor even minority interest'. Moreover, he charged that "for many politicians and intellectuals, secularism is

only a euphemism to cloak their allergy to Hinduism" Hence, he gave a call to reject (such) 'pseudo-secularism'

Thus, we find dual strands in Advani's (read BJP) thinking. He makes just a symbolic reference to India's common culture. In reality, he identifies the Indian nation with the ancient Hindu culture to the exclusion of the medieval composite culture. Moreover, he exudes pride in India's constitutional version of secularism, but, at the same time, raises the bogey of 'minorityism' and vehemently attacks the so-called pseudo-secularism.

FROM BABRI MASJID TO TEMPLE

The early party documents reveal that it recognised the existence of the Babri masjid at Ayodhya without any reservations. In the opening remarks at the NE meeting of the party in December 1986/January 1987, Advani strongly condemned the call given by the All-India Muslim Majlis e Mushawarat to "boycott republic day celebrations in protest against the Babri masjid issue".

Moreover, in the report on election strategy presented to the NE in April 1987 at Rohtak, Y Rajpal noted the need of preparing "a detailed pamphlet on scandals during Congress(I) regime" which included *inter alia* "the Babri masjid issue".

Hence, on the question of the Ayodhya dispute the BJP referred only to the Babri masjid in 1986 and 1987. It made no mention of any temple or 'janmabhoomi' in its party documents then.

In June 1989 the NE of the BJP adopted at Palampur (HP) its first detailed resolution on the Ayodhya dispute when the main point of reference in the dispute changed from the Babri masjid to the Ram Janmabhoomi temple. The party commented that the ongoing debate on the 'Ram Janmabhoomi issue' highlighted "the callous unconcern which the Congress party in particular, and the other political parties in general, betray towards the sentiments of the overwhelming majority in this country—the Hindus". Moreover, it was claimed that the BJP and the Vishwa Hindu Parishad (VHP) represented "the Hindu point of view" in the negotiations with the government. Further, the BJP categorically held Babar responsible for destroying the temple at Ayodhya and constructing a mosque in its place. The Palampur resolution asserted,

According to all available records the Moghul emperor Babar visited Ayodhya in 1528, destroyed the temple situated at the site believed to be Ram Janmasthan, and constructed a mosque in its place (emphasis added).

But this firm conviction of the BJP regarding Babar's direct involvement is controverted in the same resolution of the party which states,

it [a court of law] cannot adjudicate as to whether Babar did actually invade Ayodhya, destroyed a temple and built a mosque in its place.

It was also noted that the Muslim League lobby in the country had acquired "a new militancy and aggressiveness". This lobby had launched a campaign against the Supreme Court judgment in the Shah Bano case which had led the government to annul the verdict through legislation. "Having thus tasted blood", the party resolution commented, "this lobby set up the Babri Masjid Action Committee, mounted a vicious assault on the decisions of the Faizabad court, gave a call to boycott the republic day celebrations and organised a rally in front of parliament house giving threats of violence".

The Palampur resolution expressed its appreciation for the type of secularism practised by Jawaharlal Nehru, Vallabhbhai Patel and Rajendra Prasad. The party admired them for extending support to the restoration of the 'great Somnath Temple' at Prabhas Ratan in Gujarat with the blessings of Gandhiji. In this context, the party cited particularly the opinions expressed by the then home minister Patel who noted "both strong and widespread" sentiments of the Hindus for restoration of the Somnath temple and the idol therein.

Moreover, the party reiterated that theocracy was alien to our history and tradition. It observed,

Secularism, according to our constitution makers, meant *sarva dharma sama bhava*. It did not connote an irreligious state. It certainly did not mean rejection of our history and cultural heritage (emphasis in original).

The party put its demands before the government thus:

The sentiments of the people must be respected, and *Rama Janmasthan handed over to the Hindus*—if possible through a negotiated settlement, or else by legislation. Litigation certainly is no answer (emphasis added).

With the Palampur resolution of the BJP the point of reference over the Ayodhya dispute changed from the Babri masjid to the Ram temple. The party proclaimed itself to be the champion of the Hindu point of view on the issue. By demanding the handing over of Ram Janmasthan to the Hindus it took over the leadership of the campaign, at least in principle, from the VHP for temple construction at Ayodhya. But with regard to its demand that the government follow the Nehru line in the case of the Ayodhya dispute, the party, in reality, stood on shaky ground. It was the Nehru administration which locked the gates of the disputed structure at Ayodhya in 1951 on the grounds of maintaining law and order. Had the government pursued the Nehru line on the Ayodhya tangle it would not even have opened the gates of the disputed

structure, leave alone talk of construction of temple at the site. Thus, BJP's position in this respect is self-defeating.

SPIKING MUSLIM AGGRESSIVENESS

In his speech delivered in the Rajya Sabha in August 1989 while participating in a debate on communalism, Advani narrated three essential attributes of secularism/secular state: (i) A secular state rejects theocracy. There is no official religion. (ii) A secular state does not discriminate between one citizen and another on grounds of religion. It guarantees equality to all. (iii) A secular state guarantees full freedom of faith and worship. [4]

According to Advani the Indian constitution embodied all these features. He observed that what was done in 1950 was "the only right Constitution that could be created". He said,

We could not have theocracy. We could not think in terms of the minorities being second class citizens. In India, every single citizen, irrespective of whether he is a Hindu, whether he is a Muslim, whether he is a Christian, whether he is a Parsi, is equal, they are all equal.

Moreover, he pointed out that (i) A secular state was not an irreligious state. At least, as far as the constituent assembly was concerned, it did not think of secularism as denoting something like irreligion or anti religion. (ii) Religiosity was not communalism. A person could be ardently religious but not communal. For example, Gandhiji was a man of religion essentially, but beyond communalism, and (iii) Secularism did not mean disowning our past history or heritage or culture. This was a brilliant exposition of the liberal view of secularism.

In the same breath, however, he took an exclusivist and circumscribed view of Indian culture and heritage. By our heritage and culture he meant only the ancient Hindu heritage and culture to the exclusion of the culture and heritage of other religious communities in India, e.g., Muslims, Sikhs, Christians, Jains and Buddhists. He stated,

When I refer to heritage and culture, it certainly comprehends the *Vedas*, the *Mahabharat* and the *Ramayana*, and all that ancient literature. Whenever one talks about these there are reactions as to why he is talking of what is essentially Hindu. Yes, it may be essentially Hindu but it is Indian history, Indian culture and Indian heritage (emphasis added).

Advani also erroneously drew a parallel between the Somnath issue and the Ayodhya dispute just as had been done in the Palampur resolution. He expected the Rajiv government to adopt "the same positive approach to the problem of Ayodhya that the Nehru government and the Sardar Patel government had to the problem of Somnath". Moreover, regar-

ding the Ayodhya dispute, he said that it was "not a controversy merely between a temple and a mosque" and that it was "wrong for anyone to try to pitch Ram against Babar". He asserted, "There is nothing sacred about Babar. He was an invader. He came from outside."

Advani tactfully skirted the question of the court verdict on Ayodhya dispute while remaining firm on its non-acceptance by his party. According to him, his party had never said that it would not accept a court verdict. What it had said was that "the nature of the controversy is such that a court verdict will not solve the problem." He added that it was only a negotiated settlement that could solve this problem, not litigation. "Litigation is no solution", he averred. Moreover, he assured the Rajya Sabha that on the question of maintaining harmony and peace he was "entirely with the government".

However, Advani blamed the Rajiv government for succumbing to the campaign launched by the Muslim fundamentalists against the Supreme Court judgment on the Shah Bano case. He cited it as an illustration of the practice of appeasing the minorities and promoting a minority complex in them and warned against such acts of 'minorityism'.

Further, the BJP held that "today secularism means a premium on minorityism". In his presidential address to the NC session of the party in Bombay in September 1989, Advani observed that for most politicians in the country "secularism has become just a device for garnering bloc minority votes". This involved, he continued, their desire to appease minorities and flaunt their "allergy to Hinduism and every thing associated with the word Hindu". He noted that the utterances and activities of some elements among the minorities were becoming "increasingly aggressive" and were "ominously reminiscent of the pre-1947 years". He considered their growth "extremely dangerous for national unity". Hence, he exhorted, "These threats have to be met head-on, and squarely spiked". In response to the charge of playing a Hindu communal card he asserted at the NE meeting of the party in Bombay in September 1989 that "Let not such accusations ever put us on the defensive". Thus, we find that the BJP held, in theory, a liberal view of secularism. But at the same time it took an exclusivist view of Indian culture and heritage and adopted an aggressive stance towards the Muslims.

LOK SABHA ELECTIONS, 1989

But the aggressive posture of the BJP towards the Muslims was dampened during the Lok Sabha elections which was held towards the end of 1989. This was done by the party as a tactical step to defeat the Congress(I) and facilitate an understanding with the National Front so as to enhance its electoral prospects

simultaneously.

In its 1989 election manifesto, the BJP criticised the Congress(I). Reversal of the court verdict on the Shah Bano case was seen as an act putting a premium on communalism and obscurantism. The Congress(I) government's keenness to recognise Urdu as second official language in Uttar Pradesh was thought to be more for cornering Muslim votes than promoting the Urdu language. Moreover, it was observed that by not allowing "the rebuilding of the Ram Janma Mandir in Ayodhya" the government had allowed tensions to rise and gravely strained social harmony.

Moreover, the party reiterated in the manifesto its commitment to the concept of 'positive secularism'. It stuck to the motto of "justice for all and appeasement of none". It restated the idea of a theocratic state being anathema to the Indian mind. It held that the state had the duty to guarantee 'justice and security' to all minorities. However, the party vaguely referred to its idea of 'minorityism' by saying that it was imperative that minorities do not develop a minority complex.

The year 1990 witnessed further shifts in the position of the BJP on the Ayodhya tangle, particularly after the Mandal declaration. The BJP found its social base, both actual and potential, threatened. It saw that the Hindus were getting polarised into two warring groups of forward and backward castes on the Mandal issue. This was going to foil the gameplan of the BJP to emerge as the only alternative to the Congress(I) and assume power at the centre sometime in the near future.

To counter this Mandal mobilisation of the OBCs by the Janata Dal, the BJP acquired full leadership of the campaign for temple construction at Ayodhya. Advani flouted his own earlier assurance given to the Rajya Sabha of maintaining communal peace and harmony. He undertook the Toyota 'rathayatra' for mobilising and homogenising the whole Hindu community behind the banner of the BJP by using the issue of Ram temple construction at the disputed site at Ayodhya. His main motive was clearly political and electoral rather than religious. While speaking at a convention in New Delhi after the 'rathayatra' Advani is reported to have declared,

I am a political leader. People think I have become Advani baba. But, I am not a religious person. Our workers should know we have not converted into a religious organisation. We are a political organisation, fighting pseudo secularism (emphasis added) (The Times of India, December 25, 1990).

Moreover, during his 'rathayatra', Advani made scathing reference to the havoc caused by the Mandal report which drew cheers from the crowds. While talking to Swapna Dasgupta, he said that the 'rathayatra' had "taken away the cynicism" of the middle class (read upper caste)

students that had been fostered by the Mandal Commission[5].

Further, the resolution passed in October 1990 by the NE of the BJP observed that the issue of temple construction at the site of the Babri mosque was "not a communal issue" but "a matter of national honour calculated to promote national reconciliation". The party considered the 'rathayatra' "a great act of national integration". Though, as is well known, the 'rathayatra' left behind a trail of communal conflagrations and generated unprecedented communal tension all over the country. Instead, the BJP charged the Janata Dal government of communalising the issue. It blamed some leaders of the ruling JD-NF for whipping up communal passions leading to rioting. Finally, irrespective of the consequences of the Ayodhya campaign, it was painfully apparent during the 'rathayatra' itself, according to Swapna Dasgupta that "it is Mr Advani who has come to be identified as the real leader of the movement", although the BJP leader continued to insist that it was the VHP that was leading the Ram Janmabhoomi movement[5].

The October resolution (1990) of the BJP for the first time came up with the novel idea of 'non-masjid'. It held that the Ayodhya dispute is "between a mandir and a non-masjid" and by implication not between a masjid and a mandir and, thus, it now refused to recognise the existing Babri mosque at Ayodhya. The party advanced strange logic in this regard. It was argued that "the mosque built by Babar [sic]" was abandoned in 1936 and after which no 'namaz' was offered there. Hence, there was no more a mosque at the site. Moreover, it was added that since at least 1949, 'poojas' and 'parikramas' have been regularly going on near the site, hence, the 'mandir'.

The resolution (October 1990) also noted VHP's offer to the Muslims to "relocate the 'masjid' structure elsewhere" for building of Ram temple at the place. Moreover, it called upon the V P Singh government to "honour the sentiment of the people and allow a temple to be built at the 'janmasthan'". The BJP warned the government that if it failed to do so or it disrupted the 'rathayatra', the party would withdraw its support to government.

Further, after the arrest of Advani in Bihar the NE of the BJP adopted a resolution in November 1990 regarding the Ram mandir at Ayodhya. Contrary to the actual facts, it held that the 'rathayatra' was evidence of "national unity and national regeneration". It demanded facilities for early construction of Ram Janma Mandir at Ram Janmasthan to defuse the tension and redeem national honour. Moreover, the party rededicated itself to "the sacred task of rebuilding the Ram Janma Mandir at Ram Janmasthan". The party asked the Muslims to "come out of their isolation and join the national mainstream and find security and honour in peace with

Hindus" (emphasis added) Thus, 1990 marks a big shift in the posture adopted by the BJP with regard to the Ayodhya dispute

HINDU NATIONALISM AND HISTORICAL ANIMOSITY

In his presidential address to the Fifth National Convention of the party at Jaipur in February 1991 Murli Manohar Joshi reiterated the party's adherence to its Palampur resolution of 1989. He affirmed that "either the issue (the Ayodhya dispute) could be settled by mutual discussion or the government could make a law to hand over the site to the Ram Janmabhoomi Mukti Nyas". The party rigidly stuck to its position of constructing the temple at the disputed site. Hence, all its talk of a need for mutual discussion and debate on the issue was merely an insincere ritualistic exercise to erect a secular facade and hide its militant Hindu face. Moreover, Joshi expressed his party's big brotherly approach when he called the Muslims 'brethren' and at the same time advised them to "give up their claim of the Babri masjid and extend willing co-operation in the construction of the temple".

Joshi made a small change in the party's stand on who was to blame for the Babri mosque issue. Earlier the party held that Babar visited Ayodhya in 1528, destroyed the temple situated at the Ram Janmasthan and constructed a mosque at the place. But, now, Joshi stated that it was Babar "on whose orders the temple standing at the birth place was destroyed and replaced by a mosque structure" (emphasis added). This change was probably made to partially rectify the party's position in line with the incontrovertible historical fact mentioned in the epitaph at the disputed mosque that "this descending place of the angels was built by the fortunate noble Mir Baqi". Joshi hailed the 'rathayatra' undertaken by Advani as "the second historic 'vatra' after Mahatma Gandhi's Dandi March".

Further Joshi acknowledged that the BJP suggested the "respectful shifting of the (mosque) structure to another site" for temple construction. Earlier this offer was said to have been made by the VHP to camouflage the essentially uncompromising and aggressive posture of the party on the Ayodhya issue. Joshi made a ritualistic reference to India's constitutional secularism. As earlier he claimed that India was never a theocratic state. He regarded secularism as a fundamental feature of the Indian constitution and polity which treated all modes of worship with equal respect. However, while adorning the broad vision of the Indian mind he equated it only with the Hindu culture in a circuitous manner. He said

The Indian mind never accepted the theocratic form of state. The truth of the matter is that Hindu culture is synonymous with the co-existence of various spiritual and

intellectual experience (emphasis added)

This idea of spiritual co-existence, in reality, asserted the dominance of Hindu culture over others, including a coercive and confrontationalist attitude towards the Muslims as is evident from party's insistence on the relocation of the mosque.

The BJP has also made an important shift with regard to Nehru's secular credentials. Earlier documents of the party appreciated the secular policy of the Nehru government. Nehru, Patel and Prasad were admired particularly for the approach they adopted on the issue of the Somnath temple. But in his 1991 presidential speech Joshi charged all governments after independence with "appeasement of minorities" and practising 'minorityism'. He stated,

Unfortunately during the last forty five years secularism has come to mean appeasement of minorities. This has led to 'minorityism' (emphasis added). Hence, now, even Nehru and his colleagues were not spared the criticism of having practised minorityism.

Further, the BJP's Lok Sabha election manifesto of 1991 shows its continuing commitments to the construction of the temple and Hindu nationalism and extension of Hindu-Muslim divide. The party reasserted its determination to build Ram mandir at Janmasthan by "relocating superimposed Babri structure with due respect". It is intriguing to note the kind of 'due respect' the party wants to show to the Babri masjid through its relocation.

In the manifesto, the BJP upheld that construction of *Shri Ram mandir* at Janmasthan is a symbol of the vindication of *our cultural heritage and national self respect* (emphasis added).

This clearly implies that the party identifies Indian nationalism only with the Hindu heritage to the exclusion of that of other religious communities living in India since ages.

The manifesto also reveals the supercilious attitude of the party, particularly towards the Muslim minorities. Against the backdrop of extensive communal riots the manifesto refers only in general terms to ensuring justice for all citizens and for all sections of society, whereas in earlier manifestos the party stood for ensuring both "justice and security" especially to the minorities [6].

Finally, in the 1991 manifesto, the BJP has come out with a new hypothesis with regard to the historical relations of Hindus and Muslims in India. It observes that Hindus and Muslims are "blood brothers" but "on account of historical reasons their relationship has not been harmonious" and, thus, turns the present communalisation of politics into an historical animosity between the two communities.

In the history of over one decade of the BJP there have been significant departures in its position on the question of Hindu-Muslim relations in India. In the begin-

ning (i.e., the period, 1980-89), the party laid some emphasis on fostering communal comity and cohesion. But with the Shah Bano case in 1985 the BJP started stiffening its attitude towards the Muslims. While it proclaimed pride in India's constitutional secularism, it also raised bogey of 'minorityism' and 'pseudo-secularism'. In 1986 and 1987, the BJP documents referred only to the Babri 'masjid'. But with the Palampur resolution of the party adopted in 1989, the mandir became the main point of reference. Appreciating the Nehruvian secularism, particularly on the issue of the Somnath temple, the party demanded that the government hand over Ram Janmasthan to the Hindus. After the declaration of implementation of the Mandal recommendations by the V P Singh government, the BJP realised that its gameplan of emerging as the alternative to the Congress(I) was going to be foiled. It adopted a strident posture on the question of temple construction at the disputed site at Ayodhya to homogenise and mobilise all the Hindus under its banner. The party also refused to recognise even the existence of the Babri mosque and called it 'non masjid'. Moreover, it adopted a paternalistic attitude to the Muslims and asked them to find security by accepting Hindu domination. In 1991 it asked them to give up their claims to the Babri masjid and co-operate in the construction of the Ram temple at the site. Moreover, the Indian constitution was showered with praise for its secular principles to camouflage the uncompromising, militant and confrontational attitude of the party towards the Muslims. Now, even the Nehru administration was included in the list of the practitioners of 'minorityism'. Lastly in the elections of 1991 the party stuck to its commitment to build the Ram temple at the disputed site. It kept harping on Hindu nationalism. Moreover, it extended the current communal tension and conflict into an historical animosity between the communities through misinterpretation of history. It is indeed ironical that the BJP now proposes to work "to make all Indians fraternal and friendly once again".

Democracy and China

J Bruce Jacobs

Before the Beijing massacre many felt that China had no democratic tradition and its national conditions did not suit democracy. Now that the Chinese people have clearly expressed their desire for democracy, it is necessary to re-examine these notions

THE question of democracy in China has great importance for the world today. This article cannot provide a detailed analysis of 'democracy' but most readers will agree with two propositions. First, China's so-called 'socialist democracy' is not a form of genuine democracy, and second, 'democracy' and 'dictatorship' are two opposing concepts. Even Mao Zedong's so-called 'democratic dictatorship' actually separated the concepts of 'democracy' and 'dictatorship', providing the 'people' with 'democratic centralism' and the 'enemy' with 'dictatorship'.

Deng Xiaoping has clearly stated that the Chinese mainland cannot establish democracy. In late December 1986 he said:

When we talk about democracy we cannot mechanically copy bourgeois democracy. If China does not have the leadership of the Chinese Communist Party and if China does not engage in socialism China has no future. With respect to dictatorial methods, we must not only talk about them we must also use them when necessary (Deng Xiaoping, December 30, 1986).

Before the Beijing massacre of June 4, 1989, many Chinese and some foreign scholars felt that China had no democratic tradition and that its national conditions did not suit democracy. Now that the Chinese people including workers and peasants have expressed their desire for freedom, democracy and participation in the process of government policy formulation, etc, these notions must be re-examined.

Western democratic theory has two main currents. The first stresses 'equality', while the second emphasises 'freedom' or 'human rights'. Persons accentuating 'equality' attach importance to majorities determining the choice of leaders and the policies to be implemented. Those emphasising 'freedom' or 'human rights' highlight the importance of protecting minority rights. These two western democratic currents contain a contradiction: if a majority decide to eliminate the basic human rights of a minority, what happens? Different democratic systems give different answers, but a genuine democratic system must guarantee human rights in order to avoid becoming a dictatorship. Hitler and Mussolini both used

democratic electoral methods to win elections, but then both established dreadful dictatorships. The failure of many German and Italian citizens to attach sufficient importance to the human rights of their compatriots contributed greatly, among other reasons, to the establishment of these fascist regimes. Similarly in the establishment of the Soviet and Chinese communist dictatorships, many who supported the revolution allowed the revolution to use illegal methods to swallow the enemy. Later they discovered that the revolution used the same methods to swallow themselves.

Since the American and French revolutions of the late 18th century, 'equality' has become a basic, widely accepted concept in world political theory. But, in the history of world thought, the concept of 'equality' developed only in the modern era; it is *not* a natural concept. On the contrary, before the American and French revolutions, all complex societies accepted *inequality* as a basic principle. Obvious examples include the feudal societies of Europe and Japan and the caste system of India.

'Everyone is equal' does not mean 'everyone is the same'. Clearly each individual has his or her own talents. A may run quickly, B can lift a heavy load, C can bear children and breast feed, while D can calculate sums both quickly and accurately. Because each individual is different, we cannot create a society in which every person is absolutely equal. But we can seek to implement two extremely important types of equality. First, everyone must be equal before the law and politically. Second, each individual must be given 'equal opportunity' to develop fully his or her own abilities and aspirations. Although we often consider 'equal opportunity' an important part of American democratic tradition, in the world's history of ideas the concept originally came from China.

In discussing the democratisation of a society, we must clearly distinguish between two related but different concepts: 'liberalisation' and 'democratisation'. By 'liberalisation' I mean expanding the scope of freedom of speech, freedom of expression, 'freedom of assembly, etc.

(This 'liberalisation' differs significantly from Deng Xiaoping's 'bourgeois liberalisation', a term the communist leadership in China uses to attack western ideas and to perpetuate the dictatorial communist system.) From the Third Plenum of the Eleventh Central Committee in December 1978, which set China on its post-Mao road of reform, until the Beijing Massacre of June 4, 1989, China undeniably underwent a considerable amount of 'liberalisation'. Since 1969 Taiwan too has had substantial 'liberalisation'. 'Democracy' naturally encompasses the expansion of freedoms but it must also incorporate another necessary condition: if the majority of voters support an opposition party, the ruling party must peacefully relinquish power to its opponents. The Beijing Massacre verified the frequent statement of the Chinese Communist Party leadership that it will not relinquish power to other people or parties. Although Taiwan underwent considerable liberalisation under the leadership of the late Jiang Jingguo (Chiang Chung-kuo), the Nationalist Party (Kuomintang) also clearly would not relinquish power to an opposition. Taiwan is now entering a new political era, but we must wait and see if the Nationalist Party allows the majority of citizens to choose the ruling party before deciding whether or not this new political era is democratic.

Those afraid of democracy generally fear lack of stability. In 1986 Deng Xiaoping said:

Ever one can recall, when the National People's Congress in 1980 passed the resolution rescinding the article concerning 'the four great freedoms of speaking out freely, airing views fully, holding arena debates, and writing big character posters'. Why did we do this? Because there was a tide of liberalising thought. If we engage in liberalisation it will destroy our stable and unified political situation. If we lack a stable and unified political situation, we cannot enact our con-

struction (Speech at Sixth Plenum of Twelfth Central Committee).

In reality, those criticising democracy underestimate its strength. In a democratic system, the citizens give 'feedback' about the government's policies and the performance of officials. This 'feedback' gives a democracy considerable strength. Mao Zedong's theory of the 'mass line' recognised this fact, but in reality he did not implement it. This resulted in tragedies, horrendous in world history, such as the Great Leap Forward during which 20 million people died.

Democracy has another prerequisite. In sport, teams must accept the rules of the game. Similarly, when implementing democracy, citizens and leaders must accept the rules of the political system—its constitution, laws and conventions. A democratic political system requires a large majority of citizens and leaders to accept the system's 'legitimacy'; otherwise, there is little hope.

DEMOCRATIC ELEMENTS IN CHINESE TRADITION

Although many people assert that China lacks a democratic tradition, Chinese culture clearly has democratic elements. The thought of Confucius contains elements of equality. Confucius said that everyone was similar when born and became differentiated owing to diverse habits and education. Confucius did not consider the class origin of applicants when choosing students.

Mencius, second only to Confucius in Chinese intellectual history, also had many democratic ideas. According to Mencius, the people were the most important component of a nation. The land and grain spirits came next, while the leaders were the least important. (*Mengzi*, Book Jinxi VII-B, Chapter 14). At the time of Mencius, the 4th century BC, many people said that the state was the most important element of the world, but Mencius believed the individual was the most important element (*Mengzi*, Book Lilou IV—A, Chapter 5). Historically, many Chinese leaders have claimed the 'mandate of heaven'. Mencius clearly stated that 'heaven' first listens to the people before appointing a leader (*Mengzi*, Book Wanzhang V-A, Chapter 5). He also said the common people could rebel to overthrow a ruler lacking virtue because a ruler lacking virtue lacks the qualifications to be a ruler and hence is not a ruler (*Mengzi*, Book Lianghuiwang I-B, chapter 8). An important critic and intellectual opponent of Mencius, Mo Zi, also had important elements of democratic thought. His concept of 'universal love' ('*jian'ai*') is quite similar to 'equality'.

China not only had many democratic elements in its history of ideas, in prac-

tice the imperial Chinese system also encompassed substantial 'equal opportunity'. In pre-modern history, Chinese society led the world in institutionalised vertical social mobility. During the Ming Dynasty (1368-1644), almost one half of those obtaining the highest imperial 'jinshi' degree had no degree holder of any kind among their ancestors in the three previous generations. In other words, these people rose to the pinnacle of power from fairly modest circumstances. During the Qing Dynasty (1644-1911), almost one-fifth of 'jinshi' degree holders had no degree holder among their ancestors for three generations (*The Ladder of Success in Imperial China: Aspects of Social Mobility, 1368-1911* by Ping-ti Ho, Columbia University Press, 1962). These statistics demonstrate that considerable 'equal opportunity' existed historically in China in practice as well as in theory.

Why then is it impossible for China to institute democracy now? Three important obstacles exist. First, the dictatorial machine of the Chinese Communist Party will not allow democracy to develop. The machine, which readily uses violence to protect itself, is not easy to oppose. The low level of education among the Chinese people and their lack of democratic habits presents a second obstacle. Sun Yat-sen, the founder of the Nationalist Party, generally has a reputation for unrealistic schemes, but he did have one sensible political theory. He argued that before establishing 'constitutional government', one must first unify the nation and then institute 'political tutelage'. Although the Nationalist Party used 'political tutelage' to justify dictatorship during the Nanjing (Nanking) Decade (1927-1937), Sun Yat-sen's basic theory was correct. In the past 30 years, as the educational levels in Taiwan have risen, the demands for democracy have increased.

The third obstacle is Chinese intellectuals. This may surprise readers who know that most leaders of the democracy movement in Tiananmen Square were intellectuals. Earlier, I noted that a certain 'equal opportunity' existed in imperial Chinese society. However, imperial China emphatically did not have an egalitarian society and after receiving an imperial degree, a person obtained very high social status as part of the 'gentry'. Many contemporary Chinese intellectuals retain this type of thinking and still have a sense of superiority with respect to workers and peasants. They believe they have 'ability' and ought to govern. Although these intellectuals say they support 'democracy', actually they look down on workers and peasants and do not respect the peasants' and workers' opinions. In a genuine democracy, each person must have an equal vote. The desire of many Chinese

intellectuals to decide the interests of workers and peasants on behalf of the workers and peasants is not true democracy and, in essence, does not differ from the present dictatorial regime. I have lived with Chinese peasants for extended periods of time and discovered they clearly understand policies which affect them and are often more practical than intellectuals.

Notes

- 1 See Mao Zedong, 'On the People's Democratic Dictatorship' (June 30, 1949): "We take away the right of the reactionaries to speak and only allow the people to have the right to speak." See also Mao Zedong, 'On the Correct Handling of Contradictions among the People' (February 27, 1957): "The first function of dictatorship is to repress the nation's domestic reactionary class... the system of dictatorship is not suitable for use among the people... among the people we must implement the system of democratic-centralism". (All quotations are translated from the original Chinese.)
- 2 The Chinese Constitution contains this concept. "All citizens of the People's Republic of China are equal before the law" (Constitution dated December 4, 1982, Art 33, paragraph 2). The Chinese Election Law, in making urban votes four, five, and eight times the value of rural votes, actually conflicts with the Chinese Constitution. See J Bruce Jacobs, 'Elections in China', *The Australian Journal of Chinese Affairs*, No 25 (January 1991), 171-199, especially pp 176-181.

ON WORLD POPULATION DAY

D. K. P. D. PUBLISHING CORPORATION

announces the release of books by
Two Eminent Population Experts

India's Population: Heading Towards a Billion (An Analysis of 1991 Census Provisional Results)/

Nation, Community and Naipaul's India

Akeel Bilgrami

India: A Million Mutinies Now by V S Naipaul; Viking 1991.

THE obscurities and passions surrounding the concept of a nation afflict some populations more than others for reasons that are so complex and so entrenched that it seems almost too much to ask for diagnosis, leave alone cure. V S Naipaul, pondering contemporary India in his new book *India: A Million Mutinies Now*, is not depressed by this fact. And, as one has come to expect from him, does not much bother to make an effort at diagnosis. Instead he offers a series of detailed interviews with persons chosen as typical of some aspiring community or interest group (Muslims, Hindus, Sikhs, Kashmiris, Punjabis, Tamils, women, communists, 'untouchables' ...) and by the end of a long book he expresses a tentative optimism about his ancestral homeland on the ground that at least these passions and these ill-understood issues are being harnessed into political and social momentum—even if often in the form of sectarian hatred and violence.

This is Naipaul's third book on India. The first, *An Area of Darkness* written in 1962 on his first visit, is a somewhat hysterical response to the pervasive poverty and superstition and cruelty he encountered. Writing now almost 30 years later, he admits, with disarming candour, to a neurosis underlying that initial perception: "... my ancestors had left as indentured servants for the sugar estates of Guyana and Trinidad. I had carried in my bones that idea of abjectness and defeat and shame. It was the idea I had taken to India on that slow journey by train and ship in 1962; it was the source of my nerves." The second book, *India: A Wounded Civilisation* written in 1975 during Indira Gandhi's reign, sedates the earlier pessimism, but having sedated it, nurses it devotedly through the book. The people he meets are still defeated and backward, they have not yet found their wills and their national identity.

These books succeeded in annoying many Indians. They annoyed a large class of readers because Indians have always been a little defensive about criticism from outsiders, and Naipaul undoubtedly did speak with the prose and the mentality of a floundering foreigner. But it also annoyed some because his cultural commentary typically combines an effortless contemptuousness with an almost deliberately cultivated but, all the same, monumental ignorance of the historical and institutional sources of a culture's surface presentation. The present book will appease the first kind of reader because it is much more generous than the earlier books, and it is no longer in the shrill voice of a high-strung, reactive, alien sensibility. The second kind of reader will still stamp about in exasperation. The contempt has been withdrawn but the indif-

ference to explanation pervades the book.

Naipaul's theme is recognisably the theme that dominates India's public life. It is, in his own words: "A million mutinies, supported by twenty kinds of group excess, sectarian excess, religious excess, regional excess ..." contrasted with "a central will, a central intellect, a national idea."

The book concludes with a comment on this theme of contrast. "The Indian Union was greater than the sum of its parts; and many of these movements of excess strengthened the Indian state, defining it as a source of law and civility and reasonableness. ... And—strange irony—the mutinies were not to be wished away. They were part of the beginning of a new way for millions, part of India's growth, part of its restoration."

Naipaul's instinctive conclusion may be sound. But there is nothing in this book which gives him the right to the conclusion.

In independent nation-states, nationalist sentiment against existing governments has taken two opposing forms: the demand for secession (as, for example, in various regions of India, Pakistan and the Soviet Union) and the demand for unification (as in Germany and, from time to time, in west Asia). The former is often due to a perception by particular ethnic communities of central government domination, especially when the central government is itself dominated by a single ethnic community (more true of the Soviet Union and Pakistan than India). The latter is usually a response to a perception of an external imposition of boundaries as in Germany, or, among other things, to a perceived threat from an external enemy in their midst such as Israel in the Arab world.

Writers on India make a ritualistic observation of India's diversity. But the reason why India presents a particularly difficult and complex picture is that these two forms of nationalist sentiment co-exist and criss-cross in a complex dialectic, which needs study and analysis.

The demand for secession in India is hard to assess because any impartial and sober observer must acknowledge both the dubious workability of break-away regional nations as well as acknowledge the undeniable source of grievance in the regions against obsessively meddlesome and short-sighted central governments, which persistently ignore considerations of regional autonomy and self-governance in favour of immediate political and electoral gains. This pattern is particularly vivid, for instance, in Punjab where the extremist Sikh element was actually initially encouraged by Indira Gandhi's government so as to undermine the popularity of the moderate Sikh party, the Akali Dal and, in turn, to promote the influence of her

own regional Congress Party. When the extremists grew in strength as a result of this tired and cynical 'divide and conquer' policy, she cracked down on them with a ferocity and ineptitude which led directly to the incendiary situation which we have been witnessing for the last several years. For similar reasons, successive central governments are much to blame for why regional movements in Kashmir and Assam have turned from demanding greater autonomy to demanding wholesale independence.

The movement towards unification in India is found in religious rather than ethnic communities, most particularly the Hindus who comprise 80 per cent of the population. The issue has nothing to do with boundaries but with the claims to a unified Hinduism which has begun to define itself as a monolith with a view to seeking protection against what is perceived to be an increasing loss of identity and power in the face of the rights won by the Muslims as a minority in a secular nation. Here too the electoral ambitions of Indira Gandhi's Congress Party have initiated the problem as we see it today. Communal tension between Hindus and Muslims has existed ever since the British first introduced separate electorates in the provinces. It came to a head in the partition of India due to the manipulation of the Muslim masses by the Muslim League under Mohammad Ali Jinnah, and to the inability of the (officially) secular-minded Congress Party leadership to convince the Muslims that they had a secure place in a post-independent India. Though communal tensions and riots have persisted through the period of independence, the present threat to secularism within India began to take shape in the 1980s.

Indira Gandhi, who had long claimed popular support for her party with the empty electoral slogan 'remove poverty' (as if one could contest on the platform 'retain poverty!'), was fast losing that support not least because poverty was manifestly not being removed. In the facet of this loss of a populist secular base, she and her son Sanjay Gandhi decided to cultivate the support of the majority religious community, first against the Sikhs and then more carefully and subtly against the Muslims. After her assassination, her other son and prime minister, Rajiv Gandhi continued with this electoral strategy, playing into Hindu revivalist sentiments over the issue of the mosque at Ayodhya during the last national polls. This has created a political atmosphere in which the blatantly Hindu and anti-secular Bharatiya Janata Party can now flex its muscles and demand Hindu raj. In the last elections the Congress Party and the BJP more or less openly appealed to the idea

of an India under Hindu rule in order to win seats and offices

The idea of a monolithic and majoritarian Hinduism is a wholly mythical construct. As myths will, it goes back a long way into the recesses of Indian history and has helped to perpetuate the most remarkably resilient inegalitarian social formation in the world. It is the product of a sustained effort over centuries on the part of the upper castes to sustain their hold not only on the bases of political power but on the Hindu psyche.

This Brahmanical ascendancy had its ancient origins in a priesthood which made its alliances with kings and their officials as well as with the landed gentry. Through the control of religious ritual and the language of ritual—Sanskrit—and with the force of the Kshatriyas (the predominantly military caste) behind them it gradually created a nation-wide hegemony for the upper castes. Under both the feudal rulers during the period of Muslim rule and later in the colonial state, upper caste Hindus flourished in the state apparatus, and today they by and large dominate the executive and economic governance of the country both at the centre and in many regions—especially in the so called 'cow belt'—where they occupy most of the offices and positions in the bureaucracy, industry and the academy.

What is remarkable about this abiding control over the centres of power is that through the centuries it gave rise to a Brahmanical ideological tradition which co-opted all efforts at the reform of Hinduism from the Arya Samaj movement in the north to the Brahmo Samaj movement in Bengal, even intellectual and social movements which started with the avowed intention to raise the status and the political consciousness of the lower castes deteriorated into either elitist or anti-Muslim organisations. In the process of such a pan-Indian ideological construction, not only were the lower castes silenced, but there was also a deliberate obscuring of the highly differentiated local histories and diverse vernacular religious traditions in which caste divisions played no significant religious and social role.

The construction steadily erased the legacy and the roots of heterodox religious and populist movements from the ancient Bhakti cults to more recent syncretic movements such as the cults of Kabir and Guru Nanak. (A similar process of elitist construction and erasure of local heterodox traditions—though of course without the specific caste orientation of Hinduism—informed the rise of the urban professional classes in the Muslim community, a process which culminated in the anti-secular developments within the Muslim League and led to the creation of Pakistan.)

There is, then, a double dissimulation. The pan-Indian Brahmanical ideological tradition, which pretends to speak for a unified Hinduism and which to a large extent defines itself today against the secular concessions to religious minorities, is based on a denial of two quite different things. On the one hand, it refuses to acknowledge the

deeply inegalitarian caste divisions which characterise the Hindu society which it has come to represent and, on the other hand, it denies a historical place to the multifarious local Hinduisms which it has slowly erased and which flourished through Indian history without any particular hostility to secular conceptions nor any place for the hierarchy of caste.

The frenzied communal passion of the Hindus and the Muslims that have been unleashed in the last year can only be understood against the background of this construction of a false unity.

India adopted a secular national polity after independence and has maintained it with hazard over the last 44 years. There have been eruptions of Hindu-Muslim violence from time to time in different parts of the country in which the Muslims who are the overwhelming minority, have tended to suffer the greater destruction. In the last year or more, however, there has been sustained communal extremity unlike anything since the days just before and after partition. Things have now veered to a crisis because it is this conflict which provides the most readily available sustained distraction from recent efforts to expose the myth of a unified majoritarian Hindu society.

Towards the end of his brief tenancy as prime minister V. P. Singh declared his intention to implement the suggestions of the Mandal Commission Report which concluded that 27 per cent of central and local government jobs should be reserved for these disadvantaged Hindus. The decision to implement this was a bold move to strike an initial blow to upper caste domination, especially in the states of the cow belt. It finally went beyond the empty legislative devices which have formally outcast casteism and it gave substance to the hitherto hypocritical rhetoric of social equality which all parties produce before each election. In a word, it exposed and attacked the myth of a monolithic Hinduism by acknowledging in deed rather than word that caste inequalities exist at the very heart of the nation's centres of power.

Middle and upper class Hindus in these states who, not surprisingly, coincide with the privileged castes, responded to Singh's decision with such hysteria and public violence that it gave rise to a panic within his own ruling party. There were substantial defections from it in parliament and he was forced out of government. But toppling the government did not by itself make the issue that the Mandal Commission addressed go away. So the Bharatiya Janata Party which represents the more or less prosperous Hindus of these regions is making every effort to make it go away by campaigning, with greater vehemence than any party has dared to do at any prior period, on the revivalist platform of a Hindu raj. It claims that the glorious period of a pre-Islamic Hindu India must be revived, and argues that the morale and united strength of Hindus is being daily undermined by the secular concessions granted to the minorities by the leaders of post-independent India. The fact that the unity never really existed is being covered

over once again by pointing to a longstanding external enemy within, which if only it was suppressed, the distant and glorious past of a robust Hinduism would be India's again.

The immediate symbolic ploy in this devious strategy fastens on the wretched question of a mosque in the town of Ayodhya. The Bharatiya Janata Party vows that, if elected, it will correct a historical injustice against the Hindus by destroying the mosque and building a temple in its place.

India's most distinguished historians have categorically denied that there is a shred of evidence for these historical claims and cited the Archaeological Survey of India's reports of excavations in this area. In a letter to *The Times of India*, they concluded "It is a debasement of history to distort these events for present day communal propaganda."

Ayodhya has become the symbol of India's struggle for a secular future. By asking that Hindus recognise the strength of their majority status and vote them in on the mandate of Hinduising India, the BJP is trying to enact one of democracy's most elementary paradoxes: that one can exploit democratic institutions and civil liberties to subvert those very things. If the BJP is successful and sticks to its word, the minorities will rightly see this as the end of secular citizenship and will begin to think the unthinkable: a second partition!

Here is a good question. For 17 initial years the leadership of independent India fell into the hands of India's greatest public figure, arguably greater (on the questions being discussed) than Mahatma Gandhi. At any rate his vision of a modern, secular India was conceded by even his most vocal critics to be a genuine and honourable commitment. A comparison with Pakistan after the untimely death of Jinnah (who perversely had much the same vision as Nehru for the newly created Muslim nation), and a comparison with what might have happened if other leaders such as Vallabhbhai Patel had been at the helm in India, must allow the conclusion that to a considerable extent Nehru did succeed. But if we look around us today we can only judge the secular success of his long rule as, at best, a holding process.

The question then, is why did Nehru's vision fail to take hold? This is a large and complicated question. But a simple and central fact upon which a fuller answer must build is simply that Nehru was the leader of a party which from the very beginning despite all its secular and egalitarian pronouncements, did not make any serious effort to destroy the consolidations of Brahmanical power and ideology that I sketched earlier. Though it would be unfair to compare the Congress Party with the communally oriented nationalist campaign of the Muslim League, the fact is that from the earliest phases of the independence movement it appealed to the symbolism of a Brahmanical Hindu culture to mobilise the masses and often when it made gestures of support to Muslims in order to recruit them, it did so in ways that encouraged the most retrograde element in the Muslim com-

community, as in Gandhi's support of the Khilafat movement—a move echoed by Rajiv Gandhi's recent self-seeking support of the thoroughly reactionary Muslim Women's Bill—thus encouraging a communal ethos among the minorities as well.

Since Nehru's passing, his familial heirs not only gave up the holding process, they began to reassert the importance of that mythical Hindu construction in order to win votes.

Just as the Islamisation programme is a desperate appeal to a spurious unifying ideology by the Punjabi community to retain its hegemony in Pakistan against increasing demands by the other ethnic communities, the present reassertion of a unified Hinduism and the extreme communal feeling it has generated in the country's heartland is the desperate counter by middle-class Hindus against any popular feeling that might develop for a more socially egalitarian and casteless society. Islam, being a doctrinal religion, makes it easier for the rulers of Pakistan to make this move. They can distract from the urgent needs and demands of their people by appealing directly to the political pretensions of portions of the *Koran* and its medieval interpretation in the Sharia. But Hinduism is not a doctrinal religion and for Hindus to make the same claims, its leaders must appeal to history, the pre-Islamic 'golden age', which, as I said, has been carefully constructed upon a deliberate falsification of diverse religious traditions.

The only party which holds out hope for India's secular ideals is V P Singh's Janata Dal and its scatter of smaller and more left-wing partners. India is stuck with coalition politics for a while to come. But Singh has not defected from his promise to pursue the aspirations voiced in the Mandal Commission. There is, no doubt, much that is problematic about his position. He has been accused of having adopted these ideals to build a popular base among the lower castes against rivals in his party. That may well have been so. There is also the worry that what he has opened up is more caste-oriented politics and more communal hatred. But this is a worry that accompanies all such aspirations and should not detract from the genuine initial achievement, however small and however preliminary, of the stand he has taken. The fact is that he has directly called into question the infinite survival of one of the most fantastic forms of social evil in the history of the world, the Hindu caste system. He has, whatever his motives, opened up the possibility of a Muslim/lower caste axis and, in doing so, has revived the possibility of many cultured, grassroots political alliances which would unsettle the myth that India's national unity *can only* be imposed from the top by an upper-caste, middle-class, pan-Indian ruling elite.

The idea of the Indian nation, which has never been as precarious as it is now, needs such a redefinition of the process by which unity can be retained. The federal unity that comes from diverse co-existing cultural traditions without inequalities in social formations

is far more likely to pull India out of the present crisis of nationhood than a mythical unity with caste inequalities at its very core. Such a redefinition of unity alone will remove the neurotic obsession of governments with centrist power. It alone will allow for a framework of central government which readily concedes cultural and political autonomy to the regions. In the dialectic of secessionist and unificationist nationalist sentiments with which I began, such a redefinition of unity alone will pre-empt the secessionist threat.

If the forces that Singh's stand have released can eventually shape such a transformation in the very ideal of an Indian union, then, on his central theme, Naipaul may be right to find heart in the recent rise of multifarious aspirations and mutinies among the people of India. But to say this is to say something much more nuanced and much more guarded than what Naipaul himself concludes. Since his book offers no understanding of how these aspirations are caught up in an entrenched institutional and ideological framework, the optimism he actually sounds will be heard as something indiscriminate and perverse.

Indiscriminate, because his wide-ranging conversations with aspiring individuals, by themselves, reveal nothing of what is needed for the optimism to be borne out, nor, therefore, how fragile and conditional it ought to be. Perverse, because, it will seem to many that after two excoriating accounts written in periods of relative stability in India, he is now applauding from the sidelines just when India is terrifyingly on the verge of a breakdown of governance and of a surrender of the values of modernity that have so far defined its self-conception.

He says: "What the minorities were helping to define was the strength of the general intellectual life, and the wholeness and humanism of the values to which all Indians could appeal." Even at first sight—and the book only gives us a first sight, even if from different angles this is a numbing falsehood. The antics of the BJP and the reactionary and defensive response of the Muslims are as far from the "wholeness and humanism of values" as any political movement can be. The demands of the Sikhs for an independent Khalistan are the demands of a minority in Punjab which have been artificially created by the electoral ambitions of political parties. It is a shallow political sensibility that rests with the thought that demands induced by these means are a sign of "intellectual strength."

Naipaul's method in the study of a culture has a simple dialectic in this book. Time and again he begins with some brief observation of what some community seems like from the outside; then proceeds to step inside by letting one or two of its members speak to him of their lives, their political and personal triumphs and tribulations. The conversations are clearly meant both to redeem and revise the initial observation by adding a very specific kind of phenomenology—a personal voice telling a personal but representative history—which Naipaul then sums up in

another brief concluding description.

About the Sikhs, for example, he says initially: "To most people what had happened in the Punjab was a pure tragedy, and not easy to understand. From the outside, it seemed that the Sikhs had brought this tragedy on themselves, manufacturing grievances out of their great success in India. It was as if there was some intellectual or emotional flaw in the community, as if in their fast, unbroken rise over the last century there had developed a lack of balance between their material achievement and their internal life, so that, though in one way so adventurous and forward-looking, in another way they remained close to their tribal and country origins." Or, after chatting with one of his Muslim protagonists, he concludes with the comment: "His orthodox faith was the one pure thing he had to hold on to. He couldn't imagine life without it. It was a stringent faith. It shut out television; it had no room for heretics. All the many rules and celebrations and proscriptions were part of the completeness of Anwar's world. Take away one practice, and everything was threatened; everything might start to unravel. It was correct, for instance for Muslim men to pee squatting; and I heard later from someone who worked with Anwar, that Anwar insisted on doing this at the modern urinals in his place of work, though it created problems for him."

The "manufactured grievance", the "tragedy" of the Sikhs is nowhere evaluated—not even by the Sikhs he interviews—as being a grievance, to a large extent, manufactured by the Congress Party high command in New Delhi, nowhere diagnosed as a tragedy, of the failure of federal rule. His colourful gloss on the insular withdrawal of Anwar and other Muslims into the shell of their religion is nowhere situated in the larger picture of a struggle between a minority and the will of an elite to perpetuate a majoritarian myth. Their withdrawal reflects a very specific form of defensiveness and adaptive failure on the part of Indian Muslims, issuing from its place in a very specific ongoing historical and political context; but this is nowhere divulged. These are just two examples of a recurring lack throughout this long book. The interviews and portraits do not lack charm, and they will often move you, but they will frustrate you with their lack of intellectual substance. Naipaul's theme is too large and deep-going for this limited method.

So, in this book, something simple about Naipaul gets vividly exposed perhaps, for the first time. For years, as I said, his impatience and his seeming contempt for the cultures he wrote about, irritated readers who had some familiarity with those cultures. This book's attentive sympathy demonstrates, in retrospect, that those flaws were superficial. Without their distraction, we can see more clearly now that the gap created by the ambitiousness of his subjects on the one hand and his intellectual limitations on the other, has always been the deeper source of his shortcomings as a writer of non-fiction.

Let Us Rededicate Ourselves To Build Strong And United India

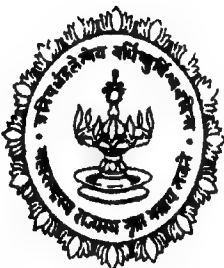

Freedom can be meaningful only when social and economic equality is ensured for all citizens.

With this objective at heart, Maharashtra has been forging ahead for the last 31 years. That is why the common man is the focal point of the State's developmental efforts. Under the dynamic and farsighted leadership of the Chief Minister, Shri Sudhakar Rao Naik, who assumed office in June this year, Maharashtra continues its march towards the attainment of this end.

Maharashtra is determined to follow the path lit by its illustrious sages and seers like Sant Dnyaneshwar, Mahatma Phule and Dr. Babasaheb Ambedkar who continue to inspire us towards establishing a society based on equality and brotherhood. Our visionary former Chief Ministers like the late Shri Yashwantrao Chavan, Shri Vasant Rao Naik and Shri Vasantdada Patil have already laid solid foundations for making Maharashtra a progressive and an egalitarian State.

Some of the programmes being vigorously implemented for fulfilling this aim are

- * Employment Guarantee Scheme assuring work to the needy farm-hands
- * Loan Waiver to marginal and landless farmers
- * Development of Horticulture on 10 lac hectares of fallow land during the Eighth Five Year Plan
- * Massive Assistance for Development of horticulture, pastures and agro-forestry on lands of small holders and farmers of Scheduled Castes and Scheduled Tribes
- * Impetus to food-processing industry based on horticulture
- * Special Action Plan for the development of the Adivasis in Gadchiroli, Chandrapur, Dhule, Nanded and Yavatmal districts
- * Implementation of "Rural Development through Manpower Scheme" in over 400 villages
- * Indira Gandhi Assistance Scheme for the Aged Landless labourers
- * Record success in production of foodgrains, cotton and sugarcane
- * Strengthening of Public Distribution System for checking rising prices
- * Special plan for total literacy in six districts
- * Daily per head incentive allowance to parents belonging to the Scheduled Castes, Scheduled Tribes, Nomadic Tribes and those below poverty line to induce them to send their daughters to primary schools
- * Provision of Rs. 2,500 crores in Eighth Five year Plan to remove regional imbalance

On this auspicious occasion of the 45th anniversary of our freedom, let us rededicate ourselves to the progress and prosperity of Maharashtra and to the unity and strength of India.

DG I PR

Ambedkar's Legacy to Dalits

Has the Nation Reneged on Its Promises?

P Radhakrishnan

Ambedkar contemplated various means for liberating the Dalits and enabling their deliverance from deprivation and social stigma to development and social respect but his legacy to the Dalits is primarily the constitutional safeguards for the scheduled castes. This paper takes stock of the fate of this legacy with a view to establishing if the nation has honoured it or reneged on its commitments.

DAI ITS, meaning 'broken or oppressed', is a synonym for the depressed classes' (DCs). Both these terms are now too loosely and indiscriminately applied to an assortment of social groups, variously labelled as oppressed, deprived, downtrodden, disabled disadvantaged, weaker sections, other backward classes (OBCs), minorities, scheduled tribes (STs), untouchables, scheduled castes (SCs), Harijans and so on.

The lumping of all these groups and the use of the terms DCs and Dalits as 'catch all' categories are for at least two reasons. First, the failure to grasp the magnitude of the disparate socio-cultural, educational and economic conditions of these groups. Second, as a ploy of self-serving politicians pretending to be the protagonists of backward classes for invidiously extending the constitutional safeguards meant for the real Dalits to the less deserving groups as well. In either case the losers are undoubtedly the really deprived and disabled bottom groups which alone are Dalits.

In this connection it is pertinent to recall B. R. Ambedkar's usage of the term DCs. That was in the limited sense of untouchables.¹ Among other things in his written statements and oral evidence before the Simon (Indian Statutory) Commission of 1928 and the Round Table Conferences of 1930-31 and their subcommittees he made it explicit that he was using DCs and untouchables as convertible terms. More often than not, he preferred to address the untouchables as just untouchables as though to remind them of their plight as a 'besieged', 'broken', and 'dehumanised' people. If he addressed them as DCs it was primarily because this term was already in circulation as a British officialese covering the untouchables and a few other groups such as the aboriginal and hill tribes.

But when occasion arose Ambedkar did not hesitate to condemn this usage. Thus, in a supplementary memorandum on the claims of the DCs for special representation submitted (along with Rao Bahadur R. Srinivasan) on November 4, 1931 to the Minorities Subcommittee of the Second Round Table Conference, he made it clear that the term DCs was degrading and contemptuous, and its use objectionable to the members of the concerned class and others interested in them. So, he demanded its

substitution with the less derogatory 'non-caste Hindus', 'protestant Hindus', or 'non-conformist Hindus' or some such appellation. In his note on the untouchables, submitted on May 1, 1932, to the Indian Franchise (Lothian) Committee of the same conference, Ambedkar again objected to the use of this term. He also noted that the term had led to a great deal of confusion in the census as it included other groups who were not strictly untouchables. Therefore, he insisted on describing the untouchables by the more expressive term 'exterior castes' or 'excluded castes' [see Government of Maharashtra 1982, 2: 474, 499, 500, 672].

While Ambedkar had no difficulty in accepting the British officialese SCs (or scheduled classes) as they were also known then) as incorporated into the Government of India Act of 1935, he detested Gandhi's grandiloquent appellation Harijans. In January 1938 when the Bombay legislative council refused to accept an amendment for deletion of this term from the Local Boards Act Amendment Bill, Ambedkar along with members of his Republican Party walked out of the house. The reasoning of B. K. Gaikwad, who moved the amendment, was that through several conferences the untouchables had voiced their opposition to this usage. If they were people of God, that is Harijans were the touchables monsters, he asked [see Keer 1987, 301-02, also Government of Maharashtra 1982, 2: 127-28].

In view of the fact that untouchables have been the largest category and the most depressed and downtrodden of all the bottom groups of Indian society, and in keeping with Ambedkar's usage of the DCs only with reference to the untouchables, the term DCs as well as its vernacular equivalent Dalits is used here in the limited sense of untouchables or their constitutional equivalent SCs. Such a restricted usage also assumes significance because of Ambedkar's role as the greatest of all the hitherto leaders of the untouchables who launched a life-long crusade for their liberation from centuries-old enslavement and ostracism.

Ambedkar contemplated various means for liberating the Dalits. However, it was primarily through the numerous safeguards incorporated into the Indian constitution, of which he himself was the chief architect, that he hoped to arm them with political

power, to improve their socio-economic, educational, and cultural conditions, and to actualise their gradual deliverance from rhetoric to reality, from deprivation to development, from social stigma and suffering to social respect, solace, and equality.

As Ambedkar's legacy to Dalits is thus primarily the constitutional safeguards for the SCs, the celebration of his birth centenary year should at least serve as an occasion to take stock of the fate of his legacy, and to ascertain if the nation has really honoured it or reneged on its promises to honour it. This calls for an examination of the performance of the various measures undertaken in pursuance of these safeguards.

CONSTITUTIONAL SAFEGUARDS

The specific constitutional provisions intended to safeguard the interests of the SCs are on the abolition of untouchability and prohibition on its practice in any form (Article 17), prohibition of 'begar' or forced or bonded labour (Article 23), consideration of the claims of the SCs (and the STs) in appointments to services and posts in connection with the affairs of the union or a state (Article 335), and reservation of seats in proportion to their numbers for the SCs (and the STs) in the Lok Sabha (Article 330) and in the Vidhan Sabhas (Article 332).

Some of the other provisions also reinforce the status of the SCs as a 'protected weaker section'. They include the departures from the anti-discriminatory and formal equality provisions of the constitution, empowering the state to make any provision for the advancement of any socially and educationally backward class of citizens (Article 15(4)) and for the reservation of appointments or posts in favour of any backward class of citizens which in the opinion of the state is not adequately represented (Article 16(4)). They also include the directive in Article 46 that the state shall promote with special care the educational and economic interests of the weaker sections of the people, and in particular, of the SCs and the STs, and shall protect them from social injustice and all forms of exploitation.²

For analytical purposes the measures undertaken in pursuance of the various constitutional provisions for the SCs may be treated under three broad categories, namely,

protective, developmental, and preferential. Abolition of untouchability and the disabilities arising out of its practice in any form, and prohibition of bonded labour come under the first category. Various educational schemes such as post matric scholarships and girls hostels under the central sector, and pre-matric stipends, reimbursement of tuition fee, book banks, and hostels under the state sector, special component plans of the centre and states, special central assistance, and the SCs Development Corporations are of the second category. Legislative, educational and employment reservations are of the third category. Of these, the effective implementation of the measures of the first two categories is a precondition for actualising the measures of the third category.⁴

However, the implementation of these measures hitherto has been too ineffective to achieve their intended objectives. This has been brought to light time and again by a number of studies, and in particular, by the commissioner (and also the commission since 1978-79) for SCs and STs.

PERSISTENCE OF UNTOUCHABILITY

The Untouchability (Offences) Act of 1955, was intended to wipe out untouch-

ability and the social disabilities arising out of it, by making its practice in any form punishable under law. But, the total number of cases registered with the police from 1955 to 1970 were only 6778 for the country as a whole, with only 1779 or 26 per cent of them ending up in conviction.⁵

As this act proved to be too weak and inadequate to meet the constitutional requirement, in November 1976 it was amended and amplified as the Protection of Civil Rights (PCR) Act, 1955,⁶ with the resolve to totally eradicate untouchability within five years of its implementation. But, even this act has not fared any better.

Data on PCR cases indicate the persistence of untouchability in virtually all the states.⁷ This is especially so in Andhra Pradesh, Gujarat, Karnataka, Madhya Pradesh, Rajasthan, Tamil Nadu, and sadly enough, even in Ambedkar's home state Maharashtra. The only state reported to be relatively free from untouchability (and from related atrocities against the SCs) is West Bengal (Table 1).

Of the yearly average of PCR cases from 1977 to 1985 only about 62 per cent of those registered with the police were 'challaned' or filed before the courts, only about 31 per cent of those before the courts were disposed

of, and only about 20 per cent of these disposals ended up in conviction. Stated differently, of the total cases registered with the police on an average not even 10 per cent (including cases brought forward) ended up in conviction (Table 2).

If this all-India pattern is any indication of the poor performance of the PCR Act, data available for some of the states indicate that the variations at the state level have been mostly for the worse. Despite a relatively higher percentage of 'challaning' by the police in at least two states (Gujarat and Karnataka), and despite a relatively higher percentage of disposals by the courts in at least one of them (Gujarat) and two others (Kerala and Tamil Nadu), in all the states most of the cases have ended up in acquittals. Stated differently, only less than 9 per cent of the cases before the courts and only less than 4 per cent of the cases registered with the police have ended up in conviction. The relatively smaller proportion of cases 'challaned' by the police and the smaller proportion of disposals by the courts tend to magnify the proportion of convictions in Rajasthan (Table 3).

While the large number of cases pending with the courts is a reflection of the tardy judicial process, the larger number of cases ending up in acquittals is for other reasons as well. As the reports of the commissioner for SCs and STs indicate, these include the weak socio-economic condition of the victims and their witnesses, defective investigation by the police, ineffective or indifferent handling of cases by the prosecution staff, victims yielding to pressures, promises, allurement, or intimidation, and the long drawn out trials which alone can discourage any victim from pursuing the case effectively.

Though the tables give some idea of the persistence of untouchability, they are too inadequate to bring out the real magnitude of this evil. For, more often than not most of the cases go unnoticed and unreported. The seventh report (1984-85) of the Commissioner for SCs and STs noted that quite a large number of the victims do not seek legal

redress, and that though in states like Bihar and Orissa the problem of untouchability is acute, they have been reporting significantly lower number of cases compared to states like Tamil Nadu, Maharashtra, and Karnataka. The reason for this is not far to seek. Economically the SCs are still dependent on caste Hindus, and as such they do not risk approaching the police.

A survey by the All-India Harijan Sevak Sangh conducted about a decade ago in 1,155 village spread over 12 states, clearly brought out the widespread practice of untouchability in the rural areas in terms of denial of access to the SCs to wells, temples, hotels and restaurants, barbershops, laundries, and so on.⁸ That this evil practice still persists unabated in many areas is evident from the subsequent reports of the Commission/er for SCs and STs. Stating that untouchability persists in one form or the other, particularly in rural areas, the eighth report (1985-86) of the Commission for SCs and STs brought to light instances of discrimination against the SCs even in urban areas, especially in Andhra Pradesh, Bihar, Karnataka, Madhya Pradesh, Orissa, Rajasthan, Tamil Nadu, and Uttar Pradesh

PERPETRATION OF ATROCITIES

Closely related to the persistence of untouchability is the perpetration of atrocities⁹ against the SCs. The atrocity cases registered have continued to be relatively more in Bihar, Gujarat, Kerala, Madhya Pradesh, Maharashtra, Rajasthan, Tamil Nadu, and Uttar Pradesh. Of late, there has also been a considerable increase in the number of atrocity cases in some states, especially in Gujarat, Madhya Pradesh, Rajasthan, and Tamil Nadu (Table 4)

Of the different types of atrocity cases registered in the whole country at least one-fourth have involved grievous hurt, followed by arson, rape, and murder (Table 5). The nature of disposal of these cases has not been any better. Data available for some of the states indicate that of the total atrocity cases for disposal by the police during 1985 only about 53 per cent were 'challaned', that of the total cases for disposal by the courts only about 5 per cent were disposed of, and that of these only about 34 per cent ended up in conviction. Stated differently, of the total cases for disposal by the police not even 10 per cent (including cases brought for

ward) ended up in conviction. The performance was especially poor in Karnataka, Madhya Pradesh, Orissa, Punjab, and Tamil Nadu (Table 6)

These cases again do not reflect the real magnitude of atrocities; more so when contrasted against the recurrent press reports from different parts of the country about the crimes on the SCs. The reasons mentioned earlier for the PCR cases also apply to this and to the large number of cases pending with the courts and ending up in acquittal.

As atrocities against the SCs are closely related to untouchability, their perpetration has to be partly explained by the persistence of untouchability and by the increasing resentment of the SCs against the social indignities emanating from its practice in different forms. These include denial of entry into public places of worship, discrimination and differential treatment in hotels and tea-stalls, refusal of service by washermen and barbers, and restriction on movement in certain localities, on wearing sandals, riding horses, and leading marriage processions through certain caste-Hindu localities.

The other major factors listed in the various reports of the Commission/er for SCs and STs include envy of the caste-Hindus for the various welfare measures adopted by the government to ameliorate the socio-economic conditions of the SCs, the wide economic disparities arising out of landlessness, wage labour, bondage, non-payment of fair share of agricultural produce to the SC sharecroppers, forced harvesting of crops, forced eviction of the SCs from their land and house sites, dispute over non-payment of minimum wages prescribed by the state, and land disputes, especially as a result of land reforms and the redistribution of surplus lands.

The reports also reveal that of late many of the atrocities committed have been by some of the affluent sections of the middle caste peasantry—the so called backward classes (OBCs)—who have been the major beneficiaries of agrarian reforms and other rural development programmes and of the resultant changes in the economic and political structure in the villages. It is important to note that, as observed in the seventh report (1984-85) of the Commission for SCs and STs, the incidence of atrocities is relatively lower in states where literacy rates and economic development of the SCs are relatively higher.

ABETMENT OF EXPLOITATIVE BONDAGE

Closely related to the persistence of untouchability and atrocities is the existence of SCs as bonded labourers. As the second report (1979-80) of the Commission for SCs and STs noted, "bonded labourers represent the extreme situation of abject prostration of landless agricultural labourers in the rural economy." The 21st report (1971-73) of the commissioner for SCs and STs described the bonded labour system as follows:

The prominent feature of the system is that

a man pledges his person or sometimes a member of his family against a loan. The pledger or his nominee is released only on its discharge. Until then the man himself or the member of the family is required to work for his creditor against his daily meals. Since he gets no money, he has to depend upon someone in the family to procure the sum required for his release and this, of course, is rarely available. The relationship lasts for months and sometimes years, occasionally for an entire life time and not infrequently follows the male heir.

The Bonded Labour System (Abolition) Act of 1976 is intended to abolish this evil prac-

tice, and identify, free, and rehabilitate its victims of whom at least 80 per cent are reported to be SCs and STs. But its implementation has not served this purpose so far. For one thing, under this act the term bonded labour itself is defined in a limited sense. Of this the fifth report (1982-83) of the Commission for SCs and STs wrote:

The very definition of the term 'bonded labour' restricts its meaning so much that its connotation excludes many who are virtually compelled but may not be forced to work as bonded labourers. It is particularly difficult to establish the element of force applied by

the creditors with the result that many labourers are excluded from the meaning of the term though their condition is by no means better than that of others. Because of the apparent loophole in the law, in states like Bihar systems like "attached labour" cannot be brought under the purview of the Bonded Labour System (Abolition) Act, 1976. Terms like "attached labour" are nothing but a euphemism for bonded labour.

For another, the implementation of the act has been far from effective even to release and rehabilitate those bonded labourers who come under its purview. Consequently, in

practice the system still persists in some form or another in many parts of the country.

Data available in the eighth report (1985-86) of the Commission for SCs and STs reveal that as on March 31, 1986 only about 2 lakh bonded labourers were identified and freed, and of them only about 1.6 lakh (78 per cent) were rehabilitated (Table 7). But, if the estimate of bonded labourers in the country at about 22.4 lakh as made by a survey conducted in 1978 by the Gandhi Peace Foundation in collaboration with the National Labour Institute is any indication, by its implementation the act has so far only scratched the surface. Even going by the conservative estimate of 3.4

lakh as made by the 32nd round of the NSS, the implementation of the act has to cover a lot more ground. What is more, due to inadequacies in the rehabilitation scheme and lack of follow up action, even the freed bonded labourers are either back in or on the verge of further bondage. Of this, the fifth report (1982-83) of the Commission for SCs and STs wrote

Rehabilitation measures in many cases do not appear to be sufficient or are adopted unimaginatively. One of the reasons for unimaginative rehabilitation is that, due to poverty, illiteracy and economic backwardness, freed bonded labourers are not in a position to exercise option and preference for

a particular scheme of rehabilitation. In such a situation the field functionaries have to decide for themselves the role of freed bonded labourers, taking a decision about what would be the form of rehabilitation.

As examples the report pointed out that in certain land-based schemes the agricultural land allotted was too inadequate for the maintenance of a family, and that sometimes such land itself was fallow and unfit for cultivation.

ECONOMIC DEPENDENCE

That many of the social disabilities of the SCs are because of their continuing existence as the poorest of the poor is stating the obvious. Available data also point towards this.

In 1982 the SCs owned only about 8 per cent of the total land owned in the rural areas in the country as a whole, though their households accounted for about 20 per cent of the total rural households. The index of their access to land ownership (that is, percentage of area owned divided by percentage of households) reveals that the land owned by them was virtually nil in Haryana and Punjab, and that the ratio of percentage of land owned to the percentage of households was not even one-fourth in Kerala and Bihar, was only between one-fourth and one-half in Gujarat, Andhra Pradesh, Tamil Nadu, Maharashtra, Uttar Pradesh, and Himachal Pradesh, and only between one-half and two-thirds in Karnataka, Madhya Pradesh, Orissa, Rajasthan, and West Bengal (Table 8).

This low access to land, the principal resource and the main source of power, dominance, oppression and exploitation in rural India, has several implications.

First, the higher percentage of landless households among the SCs compared to the rest of the population. This is so in virtually all the states, in particular in Bihar, Gujarat, Haryana, Rajasthan, Kerala, and Madhya Pradesh.

Second, the smaller area of land owned by most of the SC land owning households. In most states the SC households are conspicuous by their absence or negligible presence in the large ownership category, and by their concentration in the marginal ownership category. In Andhra Pradesh, Bihar, Haryana, Himachal Pradesh, Kerala, Orissa, Punjab, Tamil Nadu, and Uttar Pradesh between 72 per cent and 92 per cent of the land owning households among the SCs were in the marginal ownership category as against only between 39 per cent and 58 per cent of the non-SC households in all but Bihar and Kerala.

That the area of land owned by the SC households in the marginal category is too inadequate for their economic use should be only too obvious from the average size of their holdings in all the ownership categories combined. At the all India level, it is only about one-third of that among the non-SCs. At the state level it is even less. This is

TABLE 10 INDUSTRIAL CLASSIFICATION OF SCs VS GENERAL POPULATION

| SN | States/Population Categories | Cultivators | | Agricultural Labourers | | HH Industry Workers | | Other Workers | |
|-----------|------------------------------|-------------|------|------------------------|------|---------------------|------|---------------|------|
| | | 1971 | 1981 | 1971 | 1981 | 1971 | 1981 | 1971 | 1981 |
| 1 | Andhra Pradesh | | | | | | | | |
| | SCs | 14.3 | 17.4 | 71.4 | 68.2 | 1.9 | 1.4 | 12.3 | 12.9 |

Source: Tabulated from Report of the Commission for SCs and STs, 1982-83.

especially so in Punjab and Haryana, followed by Kerala, Bihar, Gujarat, Andhra Pradesh, Tamil Nadu, and Uttar Pradesh. In fact, even most of the SC households coming under the marginal ownership category should be treated as landless, inasmuch as a large number of the landless SC households have been pushed into this category consequent on the distribution of the often barren surplus and government waste lands. This is especially so in Tamil Nadu, where the percentage of landless households among the SCs appears smaller than that among the non-SCs (Table 9).

Third, the greater incidence of poverty among the SCs, and their greater deprivation by and dependence on the caste-Hindus. As the Planning Commission's Working Group on SCs and STs (1980-85) reported, the SCs have few assets, "are generally unable to avail themselves of the new employment opportunities generated through various economic development pro-

grammes", and "are in fact caught up in a vicious circle in which they are dependent upon their exploiters for their sustenance and are largely denied opportunities to develop the capabilities of attaining an independent livelihood".

Fourth, in the absence of access to land, as either owners or protected tenants, the SCs are forced to eke out a living mostly by working on the land of others as agricultural labourers on daily wages, by attaching themselves to landlords or cultivators, and as bonded labourers, and partly by pursuing their traditional 'unclean' and socially 'low' occupations of sweeping, scavenging, carrying 'nightsoil', leather work, and mat weaving.

According to the 1981 Census, cultivators accounted for only about 28 per cent, whereas agricultural labourers accounted for as much as 48 per cent of the total working population among the SCs. The corresponding percentages among the general popula-

tion (including SCs) were 42 and 23 respectively. The composition of the SC workforce in Andhra Pradesh, Gujarat, Karnataka, Maharashtra, Orissa, and Tamil Nadu was more or less of this all-India pattern. In the remaining states, with the exception of Himachal Pradesh and to some extent even Madhya Pradesh, that is, in Bihar, Haryana, Kerala, Punjab, Rajasthan, and Uttar Pradesh, the proportion of cultivators among the SCs was much less and that of the agricultural labourers much more than the corresponding proportions among the general population.

Between 1971 and 1981 there was not any drastic change in the composition of the SC workforce in most states. The only exception is Kerala, where the percentage of SC cultivators dropped from about 21 in 1971 to just 2 in 1981, and of agricultural labourers from 66 to 50, with many persons moving into the category of 'other workers'. In Kerala there was considerable fall in the percentage of agricultural labourers in the general population as well from about 31 to 20 (Table 10). The fragmentation of agricultural holdings and their uneconomic nature, especially after the decade long land reforms implementation of the seventies abolishing landlordism and tenancy, conferring ownership rights on cultivating tenants, and the increasing scarcity of water for agricultural purposes, probably caused this major shift.

EDUCATIONAL CONDITION

As the SCs can take advantage of the measures of the third and most important category of safeguards, especially of employment and educational reservations, only with educational advancement and educational advancement can come about only with socio-economic advancement, their educational condition can be a crucial indicator of their overall status as beneficiaries of the implementation of the various constitutional provisions.

No doubt, there has been some progress in the growth of literacy among the SCs. In 1961 the literacy percentages among them and the general population including them were 10.3, and 24, whereas in 1981 there were 21.4 and 36.2 respectively. Compared to the general population the increase is relatively more significant in Kerala, Himachal Pradesh, Maharashtra, Gujarat and Tamil Nadu.

Despite this increase, the SCs are still far behind the general population (even including them) in most states. This is especially so in the case of women. While the male literacy among the SCs itself is much lower than that among the general population, female literacy is much more so. In fact, female literacy among the SCs is virtually nil or negligible in Bihar, Madhya Pradesh, Orissa, Rajasthan, and Uttar Pradesh, only about one-third of their male literacy at the all-India level, and only less than one-half

TABLE II LITERACY PERCENTAGES OF SCs VS GENERAL POPULATION

Source: Tabulated from Census of India, vol. I, parts VA(i) and IIC (i) of 1961, series I, parts IIA(ii) and VA(ii) of 1971, and series I, part IIB(iii) of 1981.

in all but Kerala, Himachal Pradesh, and Maharashtra. At the all-India level female literacy among the SCs is only about three-fourths of the female literacy among the general population. At the state level, it is even less. Only in Gujarat, Kerala, Himachal Pradesh, and Maharashtra it is above this all-India rate (Table 11).

What is more, literacy, understood in the census' sense of mere ability to read and write, is at best only the base of the educational pyramid, and any growth in it assumes meaning and significance only if it is sustained at the higher levels. But, this has not happened among the SCs.

The available data might give the impres-

sion that in the primary stage the SCs have almost caught up with the general population. But, this may not be true even with a steady increase in enrolment over the years. For, enrolment is just the first step in the educational process. The report on the programme of action on national educational policy, 1986, rightly pointed out that "enrolment by itself is of little importance if children do not continue education beyond even a year many of them not seeing the school for more than a few days". The report noted that nearly 60 per cent of the children drop out between classes I-V and 75 per cent between classes I-VIII and that nearly 22 per cent of the enrolled at the primary

stage are outside 6-11 age group, mostly over-aged. For obvious reasons the corresponding percentages among the SCs must be still higher.

This is partly evident from the lower enrolment ratios of the SCs at the middle stage. Here again there is considerable inter-regional variation. If the available data are any indication,¹⁰ the position is far from satisfactory at least in Andhra Pradesh, Bihar, Haryana, Uttar Pradesh, and West Bengal (Table 12).

As the SCs move up further in the educational ladder, their enrolment ratio also shrinks or their drop out rate increases correspondingly. As the first report (1978-79) of the Commission for SCs and STs noted, for a population of about 15 per cent, at the all India level the percentage of SC students in professional and other educational courses was only 4.3 in 1964-65, and only 5.7 in 1974-75. At the state level, it was only in Maharashtra that their enrolment as percentage of the total enrolment in high school, undergraduate (UG) and post graduate (PG) equalled or exceeded their population percentage in 1976-78. In virtually all other states it was below their population percentage at all the three stages. In the high school itself the position was very bad in all but Gujarat, Kerala, and Tamil Nadu, while in the UG and PG it deteriorated even in these states. The position was especially bad in Andhra Pradesh, Bihar, Karnataka, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh, and West Bengal in the case of both UG and PG courses (Table 13). While there might have been some change in these percentages in the subsequent years as well, it would not have been so dramatic as to equalise the educational status of the SCs with the general population. The access of the SCs to higher education is further reduced by the fact that the instructions issued by the government of India for reservation of seats are not followed by a number of states.

REPRESENTATION IN PUBLIC SERVICES

If the SCs are thus still far behind the general population in their educational attainments, it is only to be inferred that they are more so in their representation in public services.

Though the representation of the SCs in the central services has increased over the years in all the four classes of jobs, it is only in class 4 that it has been adequate. In classes 1 to 3, especially in classes 1 and 2, it has been far below their population percentage (Table 14).

Comparison of the data on the representation of the SCs in the services of the states for the earliest and latest available years reveals similar shortfalls, despite an increasing trend over the years.

It is only in Maharashtra that the representation of the SCs has been adequate in all but class 1, and it is only in Gujarat, and Rajasthan that it has been so at least in

classes III and IV. In all other states their representation has been well below their population percentage. Their representation in classes I and 2 has been especially poor in Haryana, Himachal Pradesh, Madhya Pradesh, Orissa, Punjab, Tamil Nadu, Uttar Pradesh, and West Bengal (Table 15)

LIMITATIONS

As the data thus portray a dismal picture of the nation's efforts in honouring Ambedkar's legacy, there is urgent need for streamlining the implementation of the various provisions. For doing this, some of its present limitations have to be borne in mind. These limitations stem from at least nine sources:

(1) The continuing absence of social conscience, a condition so necessary for the implementation of the programmes aimed at eliminating the disabilities of the SCs. In this context it is pertinent to recall Ambedkar's observation that "rights are protected not by law but by the social and moral conscience of society"; that "(i)f social conscience is such that it is prepared to recognise the rights which law chooses to enact, rights will be safe and secure"; and that if the "rights are opposed by the community, no law, no parliament, no judiciary can guarantee them

in the real sense of the word".¹² It is in this sense that the repeated pleas by the Commission/er for SCs and STs for creating awareness among the masses and for involving them in the implementation of the various constitutional provisions have to be understood.

(2) Lack of an appropriate machinery for effectively enforcing the various measures. The official status accorded, and the facilities and personnel made available, to the Commissioner for SCs and STs appointed under Article 338 have not been commensurate with the nature of his responsibility and the enormous magnitude of the problems concerning the SCs and STs. Consequently, he has not been able to function as a 'watch-dog' agency as envisaged in the constitution.¹³

It is as though realising this, and under mounting pressures, that the government of India set up the high-level commission for SCs and STs in 1978. But, as a parallel agency so far it has tended to duplicate the work of the Commissioner for SCs and STs, who incidentally is also its ex-officio secretary. That apart, this commission itself has observed that it is greatly handicapped in performing its functions effectively as it does not enjoy any constitutional status, that its

role has been purely recommendatory, which has made it at times 'a helpless spectator of non-performance and non-compliance'.

Though economic development of the SCs is well recognised as a precondition for overcoming their social disabilities, neither of these agencies is given a clear mandate in this regard, and matters pertaining to policy issues involving the SCs are hardly ever referred to them.

Though both these agencies are expected to monitor the implementation of the various safeguards, even the mere monitoring has been wellnigh impossible for them, and their reports deplore time and again their inability to get the required information from the administrations in the states and union territories even after repeated reminders. The effect of their inability on the SCs is confounded by the long delay in preparing and placing their reports before parliament, leave alone any serious debates on the contents of these reports. Very often the reports themselves are very shoddy devoid of systematic presentation of any complete, reliable and uniform data so necessary for an overall assessment of the performance of the concerned programmes.

(3) The *ad hoc* formulation of development schemes for SCs and STs without any long term perspective and an operationally integrated strategy, as observed by, among others, the Planning Commission's Working Group on SCs and STs (1980-85) and the Commission/er for SCs and STs. Though the special component plan introduced since the Sixth Plan is expected to fill this 'lacuna', so far it has not made much headway.

(4) The meagre and woefully inadequate budget allocations in the successive five year plans for the programmes covering the SCs. As the first report (1978-79) of the Commission for SCs and STs noted, during the first 30 years of planning the SCs and STs were all along left out on the fringe, and the paltry provisions made under the sector of 'welfare of backward classes' hardly accounted for 1 to 2 per cent of the total plan outlays. The situation might not have changed dramatically in the last one decade. In this context the failure of the overall developmental efforts, problems and politics of scarcity, and like Buridan's ass,¹⁴ the state's dilemma of choosing between its alternatives, all call for some serious rethinking.

(5) The misconception of the constitutional provision for taking into account the employment claims of the SCs (and the STs) 'consistently with the maintenance of efficiency of administration' (Article 335). For preventing the abuse of this efficiency clause, the Planning Commission's Working Group mentioned earlier recommended the deletion of the clause itself. That is, however, only a desperate remedy. Consistency with efficiency has to be construed as equipping the disabled well before and even after their entry into services, to work with others on equal footing through a package of practices. The absence of such a package or its weak and inadequate presence, and the

official attempt to arrive only at a crude statistical equality devoid of the much needed socio-cultural vitality which alone can eventually, if at all, equalise the social life of the SCs with that of the mainstream groups,¹⁴ have reduced the special safeguards to tokenism and mere concessions. In the long run the nemesis of such concessions, as Tawney rightly stated in another context, is death by dilution, if not for the administration which in any case is too big to be swayed or swatted by the small number of SCs, at least for the SCs themselves by indirectly arresting their growth potential for want of motivation and morale.

(6) The 'higher-echelon' nature of the benefits and the lack of access of the SCs, especially those at the lower levels, to the administration, to the political system, and to the judiciary.

(7) The absence of any mechanism for gradually excluding individuals or groups from claiming the benefits of the constitutional provisions for special dispensation

once they have attained measurable self-reliance in terms of inter-generational socio-economic, educational, and occupational attainments or mobility. Such exclusion will prevent the present concentration, and result in the diffusion, of benefits, and gradually even phase out these provisions.

(8) The absence of any mechanism, for providing special attention to the most needy by disaggregating the individual beneficiaries into groups most deserving, least deserving, and so on.

(9) The failure of the provisions, especially those for employment and educational reservations, to penetrate private institutions.

Notes

[Part of the material used here is drawn from an earlier write-up, Radhakrishnan 1990. The author is grateful to C T Kurien and S Neelakantan for their comments on the draft of this paper.]

1 It was in the same sense that M C Rajah, leader of the DCs in Madras presidency,

used the term DCs. He had cautioned that DCs should not be confused with backward classes, inasmuch as the latter are those communities which are only educationally backward but are really high up in the social, economic and religious scales, whereas communities that are called 'Untouchable Classes' and are educationally, economically, and socially backward come under the DCs [Rajah 1925: 4-5].

2 In fact, in some of the recent writings the term Dalits is used in this restricted sense. See for instance, Shah, 1990: 107. Treating the untouchables alone as Dalits, Wilson wrote: "The term *Dalit* is derived from the Sanskrit root *Dal* which means 'to break' or 'to rend asunder' or 'to oppress'. *Dalit*, therefore, means those who are broken or oppressed. But in this particular sense there are ever so many other communities in India who also can rightly be described as Dalits. Oppression as an economic category applies to several communities. But oppression as an economic as well as a social reality applies only to one particular section whose standing as human beings continues to be the fundamental issue even in this post-independent secular and democratic Indian society. They are the so-called Panchamas, the untouchables, scheduled castes etc. Untouchability, poverty, oppression and dehumanisation are the cultural heritage of these Dalits. They can be described as the oppressed of the oppressed and the lowest of the low" [Wilson, 1982: vi].

3 Of these provisions only the legislative reservations have any constitutional time limit. But even these reservations, though originally to expire after 10 years (Article 334), have come to stay as a stable feature of India's state policy through successive constitutional amendments including the latest (62nd) amendment extending the time limit for yet another 10 years from 1990.

4 Of these, the legislative reservations are often seen with cynicism by the SCs themselves due to the lack of commitment of the beneficiaries and their vulnerability to political manipulations. Because of this, and their limited spread effects for the SCs as a whole, these reservations are not discussed here anymore. For discussion of the legislative representation of SCs, see Dushkin 1972, Galanter 1984; Shah 1990.

5 For more details on this act and its limitations, see report of the Commissioner for SCs and STs, 1971-73, 1977-78; and of the Commission for SCs and STs, 1978-79.

6 For the scope of this act, see report of the Commissioner for SCs and STs, 1977-78; and of the Commission for SCs and STs, 1978-79.

7 For analytical purposes only those states in which the SC population is 1 per cent or more of the total SC population in the country and for which at least some comparable data are available are taken into account throughout this paper.

8 For the main findings of this survey, see report of the Commission for SCs and STs, 1978-79.

9 As per the directives of the government of India, the term atrocity implies any offence under the Indian Penal Code, committed against the SCs by any non-SC person. For

purposes of collection of statistics, the Commission for SCs and STs have classified atrocities under five heads namely murder, grievous hurt, rape, arson and other IPC offences.

- 10 The data on enrolment ratios are too weak and inadequate for an overall assessment of the educational attainments of the SCs. What is more, the available data also seem defective. That probably explains the wide variations in the enrolment ratios for SCs at the middle stage from 34.3 per cent in 1982-83 (as given in the sixth report of the Commission for SCs and STs) to 47 per cent in 1984-85 (as given in Table 12 of this paper).
- 11 This observation was in Ambedkar's address. Ranade, Gandhi and Jinnah delivered under the auspices of the Deccan Sabha of Poona on January 18, 1943 on the occasion of the 101st birthday celebration of Mahadeo Govind Ranade. See government of Maharashtra 1982: 1-222. Ambedkar had made similar observations subsequently as well.

AGAINST THE WALL West Bengal Labour Scenario A Nagrik Mancha Publication

Against the Wall is an attempt to focus on the crucial industrial issues with its special emphasis on sick and closed units. It brings to the fore the profoundly human question involved in the problem facing West Bengal for more than a decade.

The collection is the product of the field studies carried out by the Nagrik Mancha activists. Veteran trade union leader Biren Roy and noted authors like Prof. A. N. Bose, Prof. Anjan Ghosh have also contributed to the making of this collection.

CHILD LABOUR IN THE INDIAN SUBCONTINENT

Dimensions and Implications

RAMESH KANBARGI (editor)

Many less developed countries (LDCs) are confronted with the twin problems of persisting higher fertility and tardy progress in the field of primary education. The main reason for this is held to be the employment of children in gainful activities from a young age. Though the ultimate aim of LDCs is to eradicate child labour, socio-economic and cultural factors coupled with conceptual, definitional and measurement problems are serious obstacles in the endeavour.

The eight papers comprising this book throw new light on the incidence, correlates and implications of child labour. The contributors explore the causes and consequences of this phenomenon with particular emphasis on rural child labour. They discuss the nature of child labour and its value in relation to that of adults.

This volume is a significant contribution to the scanty literature on this important subject. Methodologically rich and inter-disciplinary in nature, this book will interest sociologists, social workers, policy makers and planners, development activists, demographers and economists.

Rise of Kulak Power and Caste Struggle in North India

Pradhan H Prasad

While the rise of the political power of kulaks is associated with the development of capitalism in agriculture, there is no one-to-one correspondence between the two. It is only when, after the development of capitalism in agriculture, the kulaks' class interests come into clash with the class interests of the ruling class that the seed of political struggle between the two is sown. In India this process gets complicated because of traditional feudal identities related to caste and religion. An overview of the rise of kulak power and caste struggle in different parts of north India.

IT is a well known fact that colonial exploitation of India involved the growing commercialisation of agriculture and emergence of British planters in some pockets of the country. But, by and large, the "colonial revenue-cum-rent exploitation promoted not the proletarianisation of peasants so much as their pauperisation, since a substantial share of economic surplus was transferred abroad to finance metropolitan industrialisation; and the forms of capital which found the colonial economic environment particularly congenial were landlord, trader and usurer capital. Consequently these forms mediated a process of 'forced' commercialisation of agriculture ('forced' because peasants had to sell to pay rent-cum-revenue), marked by a relative absence of transformation of the productive base and structural deformation of the economy".¹

Though there was some weakening of feudal features in some pockets of India due to reforms related to tenancy and usury, anti-brahmin and other movements in the south and the Tebhaga movement in Bengal in the colonial period, capitalist production in agriculture in the real sense of the term is a post-independence phenomenon. "The inflation of the 1940s due to the second world war considerably reduced the burden of land revenue, thus providing surplus to the land owners. Independence in 1947 also reduced the drain of surplus from agriculture. The middle peasantry began to use its newly acquired surplus for rapid expansion of its agricultural activities. It had begun to redeem its lands (which were under mortgage) as early as late 1940s. In the areas of Permanent Settlement, the zamindars issued back-dated rent receipts for monetary considerations mostly to middle caste agriculturists consequent upon abolition of zamindari. These middle caste peasants, thus, were elevated from sub-tenant to tenant status. The petty bourgeois reformist pressure and the contradiction between the top peasantry and the middle peasantry arising on account of hunger for land led to various land reform legislations, particularly those related to ceiling on landholdings. Though these enactments remained mostly on paper, the cautious among the landlords sold some of their surplus land. These purchasers invariably were from the middle

peasantry. The middle peasantry not only acquired additional land during the past three decades but also strove hard to gain maximum out of its land. It achieved higher intensity of cropping. It took to new technology very enthusiastically. It combined these with modern practices of dairy farming. With its increased economic power and advantage of numbers, it began to acquire political power which had till then been traditionally exercised by the top peasantry. This contradiction was sharper in the north than in the south because in the north it also meant a contradiction between the traditionally dominant upper caste Hindus and the middle caste Hindus. Particularly in Uttar Pradesh, Bihar and to some extent in Madhya Pradesh, this contradiction led to struggles for political power which came into prominence in the late 1960".²

Even then capitalist growth in agriculture was neither widespread nor evenly distributed throughout the country, partly because of the colonial legacy and partly because of policies related to development in the post-independence era.³ Some usury and tenancy reforms in the colonial era and land reforms limited mainly to the abolition of 'intermediaries' after independence contributed to the emergence of capitalist farming but the main impetus to limited and uneven regional growth of capitalism in agriculture came from public investment in irrigation and power and public support to HYV seed-fertiliser technology in selected pockets after the mid-sixties. Therefore, the growth of capitalism in agriculture, though uneven, both in time and space, was more rapid after the mid-60s.⁴

Though the rise of the political power of kulaks (small capitalist farmers) is associated with the development of capitalism in agriculture, there is no one-to-one correspondence between the two. It is only when after the development of capitalism in agriculture, the kulaks' class interests come into clash with the class interests of the ruling class that the seed is sown for the political struggle between the two. This usually heralds mobilisation among the kulaks and the phenomena known as the 'rise of kulak power'. In India this process gets complicated because of traditional feudal identities related to caste and religion. Ever since the British days or even earlier,

the land resources remain concentrated in the hands of upper caste Hindus, the traditional feudal lords. Though the anti-brahmin movement in the south during British rule undermined the upper caste Hindus' socio-political hegemony there, in the north it was only after independence that landlordism and the upper caste Hindus' socio-economic leadership was undermined by the emerging capitalist farmers (i.e., the kulaks), mainly middle caste Hindus.

In the south, the kulak formation was associated with the growth of the regional industrial bourgeoisie and these two classes together combined gradually to forge an alliance to further their interest and came in conflict with the Indian ruling class, the monopoly industrial bourgeoisie-feudal-neoimperialist combine. Somewhat similar is the situation in Maharashtra and Gujarat. Punjab, which witnessed the earliest kulak formation in the fifties, saw the formation of the Akali political party. Subsequently, supported by the emerging regional industrial bourgeoisie and enmeshed in the feudal tradition having communal overtones, the Akali Dal emerged strong and is now posing the biggest ever political threat to the ruling class there.

In other areas of the north, there is hardly any growth of the regional industrial bourgeoisie. On the other hand, the growth of capitalism in agriculture in this part of the country shows a high degree of regional unevenness. The growth of capitalist farmers (i.e., the kulaks) took a decisive leap forward mainly after the mid-1960s, to be more precise, after the advent of the new technology in agriculture, that is, the HYV seed-fertiliser-water technology. In the political arena this finds expression in the kulaks dominating the current state-level ruling parties in Haryana, Uttar Pradesh and Bihar. However, more direct evidence of the growth of capitalism in agriculture can be seen also in economic terms.

The theoretical basis for examining empirically the extent of capitalist farming in agriculture in an economy where production is also for the market and wage labour is also in evidence, can be illustrated with the help of diagram A. This diagram shows the relationship between the value of output and labour input when it is assumed that the land area and capital are fixed and constant.

Here the value of output is defined by curve BPQ and wage cost by OSW. A farmer using wage labour will use OM of labour input (which maximises his profit i.e. his family income) and the corresponding value of output will be PM. In this case, the family income (PS) will be equal to the value of output (PM) minus the wage cost (SM), that is, $PS = PM - SM$. Whereas a farmer using only family labour will maximise his family income by employing ON family labour and the corresponding value of output will be ON such that $QN > PM$. It is needless to emphasise that in the latter case (popularly known as subsistence farming) while the value of output per unit of land (i.e. yield) will be higher, the value of output per worker will be lower than in the former case (termed as capitalist farming). This dualism has been the characteristic feature of Indian agriculture for long.¹

However, if more capital is used in farming, land area remaining the same, the output curve (BPQ) shifts upwards in each of the two cases (whether farming is of the capitalist type or the subsistence type) increasing both land and labour productivity. But in absence of accumulation, if subsistence type farming transforms itself to the capitalist type, increase in labour productivity and decline in yield will be the outcome. On the other hand, if farming changes from wage labour to family labour, the movement will be from P to Q, implying positive increase in yield but decline in labour productivity. This movement, given the dual character of our agrarian scenario and strong survival of the feudalised structure, implies absence of capitalist development even if some accumulation may be taking place. Therefore, if both yield as well as labour productivity are increasing, it implies that accumulation is taking place—a characteristic feature of capitalist agriculture.

Districtwise data² (Table 1), based on the above theoretical formulation, provide direct empirical answer to the extent of growth of capitalist agriculture in different states in India. It appears from Table 1 that the states which show capitalist transformation in agricultural sector at a fairly high level are Haryana and Punjab, at a moderate level Uttar Pradesh, Andhra Pradesh, Gujarat, Karnataka and Maharashtra and at a still lower level West Bengal.

There is enough historical evidence to support the thesis that in the arena of political struggle for power, agricultural capital (which characteristically is a petty bourgeois or at places a middle bourgeois formation) is no match for industrial capital, despite its numerical superiority. That is why in Maharashtra and Gujarat, the kulak class plays second fiddle to the monopoly industrial bourgeoisie. In Andhra Pradesh and Karnataka, where the emerging regional industrial bourgeoisie is locked in political struggle with the monopoly industrial bourgeoisie, the kulak class enjoys somewhat better leverage than their counterparts in Maharashtra and Gujarat. In West Bengal,

this class plays second fiddle to the poor peasant and working class movement. In these five states, therefore, kulaks have not made a bid for capturing political power even at the state level on its own. The kulaks' movement remains, by and large, confined to economic demands, like enhanced subsidy and credit for inputs and better terms of trade for agricultural products.³ Though the feudal ethos and identities (such as caste, communal, ethnic, etc.) are part of the Indian social milieu so long as any movement does not get associated with the political struggle for power the caste and communal overtones remain on a rather low key.

Punjab's situation is illustrative in this context. Hindu Sikh unity was proverbial there and there was not much communal tension between them. But with the emergence of a struggle for political power between the kulaks (dominated by Sikhs) and the ruling class (dominated by upper caste Hindus),⁴ the scenario changed and the struggle acquired a decisive communal overtone. In all the districts of Punjab the growth rate of yield has been more than 4.5 per cent per year, the highest among the states. But in industry, in spite of plentiful energy availability of coal, cement and steel on concessional terms (because of the steel and cement price equalisation policy and the telescopic railway freight rate for coal) and sizeable surplus from agricultural and allied activities, industrial growth was much lower than the commensurate possibilities. The growth retarding policies pursued by the Indian ruling class⁵ which have been responsible for this have united the kulaks and the emerging regional industrial bourgeoisie in their struggle for power. The

communal overtone of the political struggle has now gone beyond the narrow limits of 'demand for more regional autonomy'. This already dangerous political development has become even more so, thanks to the fact that Punjab shares an international boundary with Pakistan and the latter, supported by world imperialism, has been adding fuel to fire.

In Haryana and Uttar Pradesh, the kulaks have made a determined bid for political power. They have partly succeeded and, till recently, were in political control of the two states. In Bihar, because of the influence of neighbouring Uttar Pradesh (where the jats of the upper caste Hindus set and middle caste Hindus are the main constituents of the kulak formation), the class caste continuum helps the middle castes to wield political power at the state level even when capitalist transformation of agriculture is on a low key. That is why in Bihar it is the feudalised upper stratum of the middle castes rather than the kulaks who dominate the scene as is evident from Table 2. A critical examination of Table 2 would reveal that the big land owning group is dominated by the upper castes. In other words, the large bulk of the upper castes are big land owners. Similarly, the large bulk of landlords and rich peasants are also upper caste Hindus. The other side of the coin is that the main constituents of the upper castes are landlords and rich peasants. On the other hand, the main constituent of the upper middle castes is the middle peasantry which is mostly the middle level land owning class. The landless are mostly drawn from the lower middle castes and the scheduled castes who are also the main constituents of the poor peasant

TABLE 1 GROWTH OF LABOUR PRODUCTIVITY IN AGRICULTURE

| States | Percentage of Districts between 1962-65 and 1980-83 (both Triennial Average) | | | | |
|----------------|--|-------------|-------------|--|------|
| | Showing Annual Average Growth Rate of Yield Associated with Positive Growth of Labour Productivity | | | Showing Negative Rate of Growth of Labour Productivity | |
| | >1 | >2 | >3 | | |
| | (1) | (2) | (3) | | (4) |
| Andhra Pradesh | 58.8 (29.4) | 58.8 (11.8) | 41.2 (5.9) | | 35.3 |
| Assam | 42.9 (28.5) | 0.0 (0.0) | 0.0 (0.0) | | 42.9 |
| Bihar | 13.3 (20.0) | 0.0 (6.7) | 0.0 (0.0) | | 73.3 |
| Gujarat | 88.9 (5.5) | 88.9 (0.0) | 50.0 (0.0) | | 11.1 |
| Haryana | 100.0 (0.0) | 100.0 (0.0) | 71.4 (0.0) | | 0.0 |
| Karnataka | 84.2 (5.3) | 68.4 (0.0) | 21.1 (0.0) | | 5.3 |
| Kerala | 0.0 (0.0) | 0.0 (0.0) | 0.0 (0.0) | | 42.8 |
| Madhya Pradesh | 27.9 (7.9) | 11.6 (0.0) | 2.3 (0.0) | | 46.5 |
| Maharashtra | 100.0 (0.0) | 84.0 (0.0) | 28.0 (0.0) | | 0.0 |
| Orissa | 9.1 (0.0) | 9.1 (0.0) | 9.1 (0.0) | | 63.3 |
| Punjab | 100.0 (0.0) | 100.0 (0.0) | 100.0 (0.0) | | 0.0 |
| Rajasthan | 38.5 (0.0) | 38.5 (0.0) | 15.4 (0.0) | | 46.1 |
| Tamil Nadu | 18.2 (72.7) | 0.0 (9.1) | 0.0 (0.0) | | 81.8 |
| Uttar Pradesh | 100.0 (0.0) | 95.7 (0.0) | 66.0 (0.0) | | 0.0 |
| West Bengal | 64.3 (0.0) | 21.4 (0.0) | 0.0 (0.0) | | 21.4 |

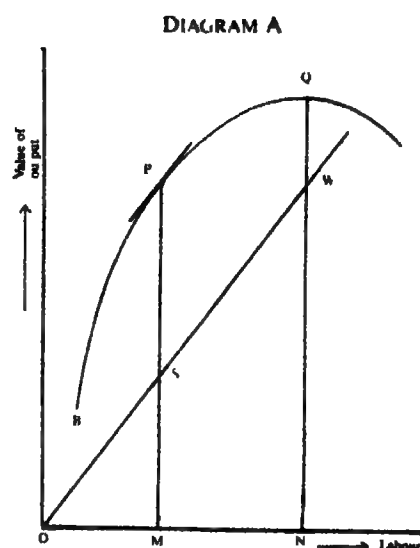

Note: Values in parentheses show percentage of districts with positive yield growth rate associated with negative growth of labour productivity.

try (i.e. agricultural and other rural labourers) In caste terms, the state-level ruling class is the upper castes and its traditional role is being challenged mainly by the upper middle castes. This is the caste character of the current political struggle in Bihar which is essentially the phenomenon of class struggle. But people are mobilised on caste lines and not on class lines because class consciousness has yet to emerge in a semi-feudal social formation whereas caste identities have been deep rooted for ages. The castes in India which represent the traditional classes, on the basis of an archaic feudal division of labour, survive with extraordinary rigidity mainly because the large bulk of people have been stuck in the quagmire of non development since centuries.

Elsewhere in north India where the capitalist formation in agriculture is on a low key, the feudalised middle castes are also trying to improve their position in the context of political struggle. But the situation is different from that in Bihar. The difference is the difference in intensity of struggle for political power and, therefore, the difference in the degree of manifestation of caste tensions. That is why the Janata Dal which emerged as the political wing of the kulaks in north India, representing different class and caste character in different states¹ could not put up a united front vis à vis the upper castes dominated ruling class. There was ultimately a split in it in August 1990. As a party of middle castes its strong presence is confined mainly to Bihar and Uttar Pradesh more strongly in the former state than in the latter. On the other hand, in spite of sharp cultural differences between the two upper castes dominated parties (i.e. the Congress(I) and the Bharatiya Janata Party which is dominated by Hindu

fundamentalists) which represent the political wing of the ruling class, both show the same intensity of antagonism against the Janata Dal. It may be noted that in the process of political struggle for power, if a class or a coalition of classes other than the ruling class acquires limited political power, this by itself is not indicative of either change in the class character of the ruling class or new entrants to the ruling class. This is evident from the fact that these recent political developments have hardly made any change in the socio economic policies relating to development. The same policies which are growth retarding are adhered to.² Nevertheless, the dynamics of the situation will hasten the decay of semi feudal production relations. On the other hand, the ruling class in order to retain power tries to keep traditional feudal identities alive and divide society on these lines. Divide and rule is becoming the order of the day.

The struggle for political power however is not confined to occupying the positions of political executives but also to acquiring posts in the government bureaucratic set up so as to control and manipulate it in the interest of the caste and class in power. It is the latter part of the struggle which is pursued and opposed by caste and class interests with equal ferocity. In Bihar caste riots were witnessed after the late government policy of job reservation for backward caste (i.e. middle caste) in the late seventies. As predicted, it widened semi feudal production relations and strengthened the grip of the upper strata of the backward castes on the state's polity which by and large represents the middle peasantry within semi feudal relations of production with a few pockets of kulak formation. But the centre's announcement of August 7, 1990 on job reservation for backward castes in the

services of the central government and its undertakings was the outcome of a similar process of the recent emergence of kulak power in north India particularly in Haryana and Uttar Pradesh. The spate of caste riots and violence following the announcement shows the stiff opposition by the traditionally dominant upper caste Hindus enmeshed in a feudal ethos. This set of job reservations is different from what was adopted for scheduled castes and scheduled tribes in the constitution of independent India by the constituent assembly. Then it was a gesture by the ruling class (i.e. the upper caste Hindus) to keep them on its side in the context of the political struggle. Similar was the motive when pseudo secular policies of appeasement of minorities (particularly the Muslims) were followed. These concessions were then being bestowed by the ruling class while the pre-

TABLE 2. CASTE, CLASS AND LAND OWNERSHIP IN THE PLAINS OF RURAL BIHAR

| Caste | Percentage of Persons to Total in Each of the Caste Groups | | | | | Class | | | Per Capita Cultivated Land Owned (In Acres) |
|-------------------------|--|------|------|------|---------------|---------------------------|----------------|--------------|---|
| | 0 | 0-5 | 5-10 | 10+ | All | Landlord and Rich Peasant | Middle Peasant | Poor Peasant | |

sent ones are being snatched from the ruling class

It is true that the immediate provocation for the policy announcement was the threat to the leader of the political wing of the ruling class, V P Singh, from the kulak leaders. In that sense it may be said that it has been done for a narrow political gain, not based on any principle, and if the timing of the announcement is taken into consideration, it does not happen to be in the best interests of the country. But so what? It serves the interests of the ruling class to a certain extent. It divides the kulaks which have been undermining the hegemony of the monopoly industrial bourgeoisie in Indian polity. The kulaks of Haryana who moved away from the kulak dominated upper middle castes in Bihar, lost their political advantage and were pushed aside by the Congress(I). Even in UP kulak unity got destroyed and provided the opportunity to Bhartiya Janata Party to emerge strong. The policies adopted and the announcements made have very rarely been designed to serve the interest of the masses or of the country. Rather, more often, they are there to serve the interests of the ruling class. Take any major policy in independent India, be it MRTP and FERRA regulations, pricing of public goods and services, bank nationalisation, waiver of bank loans, agricultural policy, fiscal policy, industrial licensing policy, export and import policies, policy on foreign collaboration, rural development policies or subsidies policy, each one of them was there to serve the interests of the ruling class. Some of them at times may have done some good in some places to the people in general but, on the whole, they retarded the growth of the Indian economy and slowed the pace of social transformation. This policy at least has no such demerit. Though it offers a short period of respite to the ruling class—the attempt has been to divide the kulaks and to bring one section to the aid of the ruling class—this policy will also go a long way to weaken the stranglehold of semi-feudal relations of production and thereby hasten the decay of the feudal class which is a close ally of the monopoly industrial bourgeoisie.

The upper caste dominated intellectual and professional groups are very critical of this policy of job reservation. They argue that it will lead to loss of efficiency and further divide the society on caste lines, increasing disharmony among the people. They are crying themselves hoarse over this. What is forgotten in this context is that in the south where job reservation for backward castes in services has been in existence for quite some time (since the thirties), neither has there been any increase in disharmony within the society on caste basis nor has the performance of the services been any worse than in the north. The performance of public services, on the whole, is a shade better in the south than in the north. It has also been argued that the major beneficiaries will be the economically better off sections of the

backward castes and not necessarily the economically weaker sections among them. What is not recognised in this context is that the forces of the market, which in the transitional society (in transition from a semi-feudal to a capitalist social formation) are characterised by interlocking and other imperfections, always provide considerable weightage to the economically stronger sections of the society. Even prior to job reservation, most of the advantages arising out of public policies were being cornered by the economically affluent among the upper castes. Since political power is in the process of getting tilted in favour of the economically affluent among the middle castes, they have extracted the advantage of job reservation in their favour. This is, by and large, to provide weightage to the affluent among the middle castes, as against the affluent among the upper castes. As a matter of fact many other policies which were initiated with the avowed objective of upliftment of the poor and downtrodden by the upper castes have failed to achieve their objectives. Then why expect or demand any such miracle from this measure?

These and many more arguments and counter arguments may be less important for their logical and factual content than for what they reveal about the sharp divisions among the Indian intelligentsia on caste lines. Even the media persons who were supposed to maintain objectivity as purveyors of news are not free from caste bias. For example, V P Singh, who had been put on a fairly high pedestal by the press prior to the announcement of job reservation for the 'backward castes', was unceremoniously pulled down by the same press because of the upper caste dominance of the press. Let us take another example of the chief minister of Bihar, Laloo Prasad, who is presently the person most condemned by the press. It is being maintained that he has done nothing for Bihar and that he encourages disorder and is wholly responsible for the deteriorating law and order situation notwithstanding the fact that during his period Bihar has remained free from communal riots when in neighbouring Uttar Pradesh Hindu-Muslim riots have been a frequent occurrence. Bihar has had many chief ministers since independence. Many of them have been there as chief minister for longer durations than the present incumbent. But none of them has succeeded (even a little) in pulling Bihar out of the morass of non-development. None has been able to check the deteriorating law and order situation in the state. None can be credited with making even a slight dent on the increasing criminalisation of the society. But because none has so far championed the cause of job reservation for the 'backward castes' from a position of strength as the present incumbent does, none has earned the combined wrath of upper caste people including media persons, social scientists, bureaucrats and the rest of the intelligentsia as Laloo Prasad has. Even the election commission an

august quasi-judicial body instituted under our constitution, singled out Bihar for its wrath, so much so that even bureaucrats (including very senior ones) of known integrity were not spared. Thus the battle-lines have been drawn, particularly in north India (in the most severe form in Bihar) and the struggle is likely to be fierce and long-drawn.

Science as a Tool in British India

R K Kochhar

The production and growth of modern science in India was encouraged by the British with a view to furthering colonial interests. British-sponsored science, by its very nature was field science and its agenda was decided on grounds of political and commercial gain. In the pursuit of this state-sponsored science, Indians provided cheap labour. It was only much later, with the westernisation of the Indian middle classes, that Indians began to pursue science on their own initiative but this was as an extension of the nationalist movement and science increasingly began to be seen purely as an intellectual exercise rather than as a means of producing wealth.

WHILE discussing the impact of modern science on India, it is important to take note of India's role in the development of modern science. The arrival of the first British ship in India coincided with the invention of the telescope in Europe. There were huge profits to be made from trade with India, provided the ocean navigation could be made safe. To survive on a vast featureless ocean, a mariner had to know his latitude and longitude, and for this he needed telescopes, sextants, clocks, and star charts. Farmers, weavers, and other traditional craftsmen in Britain now took to making scientific instruments. Many apprentices in the clock making trade later became inventors of industrial machines and helped usher in the industrial revolution [1]. Thus it was a clock maker who helped barber turned industrialist Richard Arkwright build his epoch making 'water frame'. Also James Watt started his career as a maker of mathematical instruments like sextants and compasses.

For an invention to make an impact it should take place at a time when the society has the capital as well as a market. A turning point in the history of India as well in the history of science and technology is the battle of Plassey. Before 1757 Bengal had a surplus balance of payments; its exports exceeded the imports by a factor of four. In contrast, during 1757-80 Bengal pumped in a substantial sum of 38 million pounds sterling into England [2]. Its effect was electric.

The first inventor of a textile machine, John Kay, who patented his fly shuttle in 1733, barely escaped with his life, finally dying penniless in far away France. His machine was smashed by other weavers [3] who sensed that it would drive them out of the limited domestic market they all competed for. But by the time John Hargreaves made his spinning jenny (1764) times had changed. His very first machine was also smashed, but very soon he had weavers back at his door, this time asking him to make machines for them. They could now form a guild and jointly enjoy the overseas market. It is thus no wonder that cure for scurvy, the dreaded disease of the mariner (1754) came just before Plassey, while spinning jenny (1764), water frame (1769) and steam engine (1769) soon followed.

The money from trade with the east Indies created a wealthy middle class in Europe whose way of looking at things was different. It was for the first time in the history

that human prosperity depended not upon the goodwill of the king or god, but on human skill. Since the source of money was science, the pursuit of the leisured class chose were also scientific. The new craftsmen became rich and respectable, and the new wealthy became patrons of science. It is significant that the profits of the makers of scientific instruments did not come from the government who paid less but imparted prestige and recognition. The profits instead came from the private buyers [4]. It was thus the accumulated wealth of India that funded the industrial and scientific revolutions of Europe. Note that the scientific revolution came after the industrial revolution. The existence of a wealthy middle class, independent of the government, is a prerequisite for the growth of science. The purpose of science is to produce and protect wealth. The purpose of this wealth is to support science.

Western science was not a cut and dried product that was taken off the shelf and shipped to India. The British influence in India, modern science in Europe, and the use of science in India all grew together so that by the beginning of 20th century Indians were ready for a taste of their own with modern science. We present here a model as a framework for discussing the advent and growth of modern science in colonial India. The model distinguishes between three mutually overlapping stages of development.

The first stage here called the colonial tool stage, encompasses the whole span of European presence in India and consists of introduction and use of science, especially by the British, as an imperialist tool, with incidental benefits to science. The second stage, the peripheral native stage, came into being when the British were well entrenched in India. In it the Indians were assigned the peripheral role of providing cheap labour to the colonial science machinery. The third stage, the Indian response stage, arose as a reaction to the second stage and is characterised by scientific activity by Indians themselves and on their own initiative. We shall now discuss each stage separately, drawing illustrations mostly from the Survey of India [5] which represented science in the most dedicated service of the state.

COLONIAL TOOL STAGE

The gold coin minted by the Portuguese for use in India depicted the armillary sphere, the basic instrument of navigation used for

determination of the latitude [6]. It was Portugal's way of paying tribute to a science to which it owed its power. The Portuguese arrived in India even before the Mughals did, loved Christianity more than they loved Indian territory, and did not know how to successfully deal with the scurvy deaths on the sea.

The earliest men of science from Europe were the missionaries of the Society of Jesus, who first arrived in 1542 and remained active for more than 200 years [5a]. In 1759 the king of Portugal banished all Jesuits from Portuguese colonies and in 1773 the Pope banished the Order altogether. It was revived in about 1818 with the first English Jesuits arriving in Calcutta in 1833. The Jesuits were the only European men of science in India who did not have a maternalistic axe to grind. No wonder their work did not have any contemporary significance. The Jesuit geographical data were dug up from the archives and put to use in the mid 18th century when knowing India became a paying proposition.

The Portuguese success brought British and the French traders to India. The parent companies started compiling sea charts and keeping records of voyages. Observatories were opened at Paris (1667) and Greenwich (1675) to solve the problem of the longitude. The Astronomer Royal supplemented his meagre salary by giving tuition to young men seeking employment with the East India Company. It paid to join the company and it paid to know astronomy.

With the post Aurangzeb collapse of the Mughal empire, the European 'vaishya' outfit developed 'kshatriya' ambitions and got down to the task of acquainting themselves with their future empire. The French were more successful on the scientific front than on the colonial. The first worthwhile map of India was compiled in 1752 by the French geographer Jean Baptiste Bourguignon D'Anville at the request of French East India Company who based it on whatever geographical information he could lay his hands on. The value of D'Anville's *Carte de l'Inde* can be judged from the fact that it was reprinted in England in 1754 and then again in 1759 along with the annotated translation of his memoirs [5a].

Astronomy was the first modern science to be brought to India for use as a geographical and navigational aid [5a]. Its use was however sporadic and mostly out of personal curiosity. Systematic scientific effort became essential when the 1757 battle of

Plassey transformed the British East India Company into a jagirdar. The company bahadur was fully conscious of its needs: survey of its present and future lands, safety navigation, increased revenue, and proper administration. The first need was geographical knowledge. In 1757 itself when Clive was still at the nawab's capital Mirdabad, he proposed that "an exact and useful survey may be made which will enable us to settle beneficial boundaries." Accordingly a 'Surveyor of the New Lands' was appointed in 1761, and in 1767, two years after the company received 'divani' rights over Bengal, Bihar and Orissa, Maj James Rennell was made the 'Surveyor General of Bengal'.

Surveys were continually required for military purposes. Geographical location of important places in the country were determined with alacrity by "borrowing a sextant here, a watch there, and a quadrant in another quarter, from different officers at Calcutta who happened to possess them. Surveyors were sent out with every army to prepare route maps. The importance of surveys can be gauged by the fact that in 1790 when the governor general took the command against Tipu, the sultan of Mysore, he appointed the surveyor general to his personal staff. In 1793 the company paid the fabulous amount of Rs 6,000 to a surveyor for a map of Mysore accompanied by a memoir[7].

The destruction of Tipu in 1799 extended the company's territories from the east coast to the west. Just as Plassey had produced its Rennell, Seringapatam produced its Lambton, only more quickly. Unlike Rennell's survey which was run in traditional, route survey style, Major William Lambton modelled his on the lines of the recently started surveys in France and England. The Trigonometrical Survey of Peninsular India started in 1800 with second hand instruments bought within the country. Expectedly, its history is also the history of the entrenchment of the British in India. In 1817 the Marhattas were finally crushed. On January 1, 1818, the survey was renamed the Great Trigonometrical Survey of India (GTS) and extended to cover the whole country. It even surreptitiously covered trans-Himalayan region. The GTS came to its own in 1830 under Lt Col Sir George Everest who was also appointed the surveyor general. The GTS fixed with great accuracy the longitude and latitude of a large number of places. The details were then filled in by the topographical and revenue surveys. In 1878 the three were merged under the name the 'survey of India'. (The name GTS is often retroactively applied to include Lambton's survey and the Survey of India to its predecessor constituents.) Uniformly accurate data from such a huge landmass as India led to the important geodesical theory of isostasy and to a mathematical model of the earth, known as Everest geoid.

As early as 1787 General William Roy, the founder of the British survey wrote how

desirable it was to determine the length of a degree of latitude on the Coromandel coast and in Bengal. It was too early for the company to bother about the shape of the earth when its ships were getting wrecked. Rennell and Alexander Dalrymple, the company's hydrographer at London made a joint reply[5a].

Whatever Advantage to Science may be derived from the exact determination of the figure of the Earth we conceive no other benefit can possibly attend the Admeasurement in Bengal but that proposed on the Coast of Coromandel will contribute towards the construction of an exact chart of the coast.

The Coromandel Coast is rocky full of shoals without a natural port and was a graveyard for the company's ships. A survey of the coast was thus literally a matter of life and death, and eventually in 1785 a professionally trained surveyor astronomer Michael Topping was brought from England, on free passage and equipped with his instruments.

Since his work required a reference meridian, an astronomical observatory[8] was set up at Madras in 1790. It was the first modern public observatory outside Europe. While pleading for it Topping reminded the company directors that they now had a chance of "affording their support to a science to which they are indebted for the sovereignty of a rich and extensive empire." Although the company had grandiosely declared that the purpose of the observatory was to "promote the knowledge of astronomy geography, and navigation in India", the key objective was left unstated: so as to promote the company's profitability.

Science was only a part of the duties of the company's officers. The value of various services can be gauged by the value placed on them: Topping's monthly salary as the 'Company's Astronomer and Geographical Marine Surveyor' was 192 pagodas (1 pagoda = Rs 3 1/2, £1 = Rs 8). He got double this amount (Rs 400 pagodas) as the 'Superintendent of Tank Repairs and Water Courses'. An additional 100 pagodas came from the superintendence of the surveying school[5a].

In the early years the observatory was no more than a surveying outfit. This role ended with the 1830 reorganisation of the GTS, but navigational needs were still outstanding. Increased sea trade activities of the British required familiarity with the southern skies. In 1844 after 14 years of labour, Thomas Glanville Taylor (FRS) produced the celebrated Madras catalogue giving positions of about 11000 southern stars. It was hailed by the Astronomer Royal as "the greatest catalogue of modern times" and revised in 1893 with funds from the India Office and the Royal Society[8].

The observatory was now redundant. Even the British astronomers who now had observatories in South Africa and Australia lost interest. The Astronomer Royal wanted it abolished but could not succeed against

the assertion of the local British pride, succinctly expressed in the letter written by the Madras director of public instruction to his chief secretary[8]. "I earnestly hope that the rulers of India will take a higher and more extended view of the matter, and consider what is due to this country." This rhetoric, and the workshops of the public works department, ensured the observatory's survival but not its prosperity.

India's astronomical fortunes revived with the advent of the new field of solar physics. India was ideal for extensive photography of the sun, which was not possible in cloudy Britain. Also, it was then believed that a study of the sun would help predict the failure of the monsoons. In 1878 solar photography was started at Survey of India, Dehra Dun, and photographs were sent to England for analysis[8]. A solar observatory was set up at Kodaikanal in 1899.

Once the Trigonometrical Survey was begun, the government lost interest in the Madras observatory. In 1801 the Madras astronomer was getting a monthly salary of Rs 672 whereas the superintendent of the Trigonometrical Survey was slightly better placed at Rs 980. Seven decades later, in 1877 while the astronomer's salary had crawled up to Rs 800, the survey chief's had jumped to a substantial Rs 2,565. Fifteen surveyors were getting more than the astronomer, three of them being fellows of the Royal Society. All surveys were manned by military officers. Whereas meteorological and magnetic observations were considered legitimate military duty, pure astronomy was not[9].

The last word on where pure science stood up *vis a vis* the applied belongs to the irrepressible Everest. In 1834, on orders from the government, astronomical instruments from the survey were issued to enable the former Bombay astronomer to observe the phenomenon of the opposition of Mars. This happened when Everest was out on a field tour. On his return Everest made a strong protest against the loan, saying[8],

The discoveries which the late Astronomer of Bombay is likely to make in science would hardly repay the inconvenience occasioned by retarding the operations of the Great Trigonometrical Survey.

From geography to geology was but a natural step. In 1818 Henry Voysey a surgeon, who doubled as a geologist was attached to the GTS so that he could draw attention to anything that might influence geometrical and astronomical observations. The survey of the Himalayan region naturally brought forth interest in its legendary mineral wealth. The governor general wrote (1817)

We have been duly sensible of the want of professional enquiry into the mineral produce of the hill country lately acquired by us. The remedy now offers itself.

The remedy consisted of the person of Alexander Lairdlaw, 'mineralogist and investigator of natural history', though 'lack

ing in liberal education. He was sent out by the court of directors. His pay was consistent with the wealth he was to explore "a salary of Rs 600 plus Rs 200 for hill carriage, and free issue of instruments and stores, to say nothing of an advance of Rs 2,500 in cash" He was attached to the survey of Kumaun. The governor general wanted him to look for metals but added "To copper or iron I would not point Mr Laidlaw's attention, as I think that working either might injuriously affect important articles of British export" Laidlaw did not pay attention to anything, and was dismissed after two years[5c]

Voysey's reports included one on the stone used in building the Taj at Agra. He also reported on diamond mines of south India. Industrial revolution meant the realisation that coal was more important than diamond. As the steamer ships were pressed into use, the government became interested in coal fields. This led to the appointment of a geological surveyor to the company, and in 1851 to the geological survey of India[10]. (The survey of India, the geological survey, and the medical service, were the only science services in the pre-mutiny India.) Geological evidence in support of the continental drift hypothesis came from India; this fact is commemorated in the name 'Gondwana' for the ancient southern super-continent. As was the case with GTS earlier, the geological survey arranged for lectures at Presidency College, Calcutta[10].

The company's interest in Indian botany did not arise from medicinal and commercial plants as was the case with the Portuguese but from wood. Shipments out of Calcutta required the building of freight vessels for which teak was bought at a high price from Burma. Could teak be grown near Calcutta itself? To find an answer a botanical garden was set up at Calcutta[10]. (Years later decline in availability of timber for ship building on the Malabar coast made the government wise to the destruction of forests and led to the appointment of A Gibson as conservator of forests for Bombay presidency)[7].

At the fall of Mysore, the botanical garden at Bangalore (the Lal Bagh) was appropriated by the company as a depository for useful plants sent from different parts of the country. The company's botanist at Madras (Benjamin Heyne) was ordered by the governor general to accompany the surveyor, with the following instructions[5a]

A decided superiority must be given to useful plants over those which are merely recommended by their rarity or their beauty, to collect with care all that is connected with the arts and manufactures of this country or that promises to be useful in our own, to give due attention to the timber employed in the various provinces of his route, and to collect with particular diligence the valuable plants connected with his own immediate profession [i.e. medicine]

In the next 50 years 'systematic, geographical and economic studies' of the Indian

flora were carried out. The company did not mind the enrichment of science as long as it took place in the normal course of its own activities. But the moment it was asked to extend patronage to science for the sake of science, it balked. It refused to promote a project by Joseph Dalton Hooker and Thomas Thomson for its compilation, notwithstanding a memorandum from the British Association for the Advancement of Science. Hooker's monumental seven-volume *Flora of British India* (1875-1897) had to wait for orders from the secretary of state[10].

The British desire for exploration and increased revenue led to the epoch making discovery of fossil fauna in the Shivalik hills. The story deserves to be told in some detail[7], because it brightens a particularly dark period in Delhi. As early as AD 1360 Firishah informs us when Firozshah Tughlak cut through a hill with 50,000 men to dig a west Yamuna canal he noticed bones of giants three yards long. After preliminary survey in 1809-10, restoration work was begun in 1815 and completed in 1827. In the meantime, in 1779, the Rohilla Fauzdar of Saharanpur, Zabita Khan had set up a public garden at Saharanpur and appropriated the revenue of seven villages for its maintenance. Ghulam Kadir, and after him the Mahrattas continued the arrangement. In 1823 Lord Hastings converted it into a 400 acre botanical garden (to which was later added a nursery of trees for canal banks).

Hugh Falconer FRS, the superintendent of the Saharanpur Botanical Garden (who was aware of Firishah's report) and Sir Proby Thomas Cautley superintendent of canals collected a large number of fossil bones, 300 of them within six hours. These discoveries proved that in the remote past a sea occupied the valleys of the Indus and Ganga. The well known pattern of the company's attitude towards science is repeated here. Falconer wanted to devote his full time to his great work *Fauna Antiqua Sevalensis* but as a 1878 *Memoir*[7] put it he was not spared to complete it. This work was edited and published after his death.

The last scientific act of the British Indian government was dictated by the second world war which in turn brought about its exit from India. In 1942 the council for scientific and industrial research was set up for providing scientific support for the war effort.

We have thus seen that the British rulers were not interested in science as such, but in using science to further their interests. Whenever their practical needs pointed a finger towards a particular branch of science, attention was paid to that science. Harnessing science enriches it also. Thus in the process of empire building, India was added as a laboratory to the edifice of modern science. We now discuss the role of the Indians as laboratory assistants.

PERIPHERAL NATIVE STAGE

Just as the British in India needed science, they needed Indians also. The first task assigned to the natives was to educate the foreigners about the lay of the land, without which knowledge their military might would be useless. In 1774 "Golam Mohamad, a sepoy officer" was sent "to explore the roads and countries of the Deccan" and "to gain intelligence about the Mahratta powers". In the 1780s, the surveyor general of Madras employed "Munshys to survey some roads between places well ascertained in the map" and procure "some very useful information". The company reimbursed the expenditure of Rs 12,000. In 1791 the Bengal surveyor Reuben Burrow while budgeting for his journey asked for 'a Moonshy' at Rs 25 a month adding "The last article is more necessary than at first sight may appear, as it is often requisite to send a Moonshy to make enquiries and to take bearings, and to get copies of routes etc". "A properly instructed native" Mirza Mogul Beg collected data between 1786 and 1796 that went into 'a map of the countries to the west of Delhi, as far as Cabul and Multan', prepared by Francis Wilford in 1804.

The most spectacular use of the native surveyors was by Col Charles Reynolds (later lieutenant general), surveyor general of Bombay who employed them for 12 years from 1795 to 1807 to collect data for a large scale map of western India, especially of territories outside the company's control. As a part of this work, Reynolds discovered that Ghaggar does not cross the desert to reach the sea as had been supposed by earlier geographers, but instead loses its way in the sands near Sirsa. Reynolds received the princely sum of two lakh rupees for his valuable map[5a].

On the other end were company surveyors who hired 'native assistants' or 'harkaras' (messengers) to do the legwork. The company refused to reimburse these expenses. It was one thing to pay for inside information on the Mahrattas, but the company had no intention of spending its hard earned money on such useless piece of information as that the rivers Sone and Narmada do not spring from the same place as Rennell had supposed but arose 40 miles apart[5a].

The company, not yet sure of itself, was never very comfortable with the use of the natives, which though convenient and economical, was risky. While they might add to the knowledge of the Europeans they might become knowledgeable themselves, or worse sell the information to the French or Dutch rivals. For the latter reason, half-castes were not employed. Madras presidency solved its problem of manpower shortage in a far sighted way. Madras observatory ran a surveying school from 1794 to 1810 to train teenager European orphaned boys as practical revenue surveyors. Note that this school was *not* for Indians[5a,b]. Those were the days—over by 1830—when the word 'native' denoted India born irrespective of the

ethnicity.

Finally in 1813, the use of barkaras for survey work was banned, "as government were anxious to prevent the Natives from obtaining, or being taught, any knowledge of the kind". Only the company's own commissioned or military officers could carry out surveying and map making[5b].

The role of the 'pandits' (educated Hindus, regardless of the caste) and 'munshis' (educated muhammadans) was over for the time being. In the next 15 years, new geo-political equations were established, and the British grip on India became unassailable. It was only then that 'babus' were trained and pressed into service. As the survey work expanded, need for involving the Indians themselves was increasingly felt. After all, you cannot entirely dispense with the natives in their own country. A major factor in their favour was the climate.

their service will prove of the greatest use in exploring the wilds—of Bustar, etc, whose dreadful climate no European constitution could possibly sustain for any length of time (1828)

The British surveyors naturally argued for the use of the natives[5c]:

The advantages derived to government are apparent... opening a new field for natives, teaching them a profession hitherto unknown to them in this presidency—and allowing government to take advantage of the cheapest agency—obtaining correct surveys of the land, on which the principle revenue of the state depends—and a properly authenticated survey, so necessary to the due administration of justice.

The policy found support at the highest level. In 1829, Lord William Bentinck, governor general of India, wrote in a minute on the organisation of the survey[5c]:

It is by a more enlarged employment of native agency that the business of a government will be at once more cheaply and efficiently transacted.

It is quite remarkable that the needs of the survey were reflected in the company's attitude towards native education.

In the post-Plassey period, it became essential for the British to know India, not only the land but people also. This information can have come only from the Indians themselves. Accordingly there opened a[11] 'Muhammadan Madrasa' (1781) at Calcutta and a 'Sanskrit College' (1791) at Banaras so that band of young Hindus and Muslims could separately collect the traditional information from their elders and pass it on to the British (English was not taught at these institutions). We may call this 'the Moonshie phase' of education in British India with the old spellings being advisedly used to underline the intended purpose.

In 1792, one of the company directors had succinctly expressed the argument against educating the natives, "we had just lost America from our folly in having allowed the establishment of schools and colleges, and that it would not do for us to repeat the same act of folly in regard to India; ... if

the natives required any thing in way of education, they must come to England for it". Once the British were firmly entrenched, they shifted gear to impart English education to the Indians with a view to training them for minor jobs in the new administration. This was the beginning of 'baboo phase'.

The period 1813-35 is the transitional period. It was in 1813 that the company acquired an education policy whereby it was asked to spend not less than one lakh rupees on education. (Actually it spent twice the amount during 1813-30)[11]. The ambivalence as to how this money was to be utilised was deliberate. As befits a cautious and clever ruler, the transition from the Moonshie to the Baboo phase was to be effected in an unobtrusive manner, and with the full and active support of the native leadership.

The oriental colleges were slowly anglicised. Unani and Ayurvedic classes were added (1827) to the Madrasa and the Sanskrit College, which then made way (1835) for a full-fledged (western) medical college. Delhi College was started on oriental pattern in 1823; but English was introduced two years later, and science soon thereafter. In 1817 Hindu College was started at Calcutta. Scientific equipment arrived in 1823 and science teaching was started. Interestingly George Everest, who arrived in India in 1806 when barely 16, himself learnt his science from survey-related books available in British. Earlier the company had hired Hindu and Muslim boys to attend Oriental Colleges. Now the Hindu boys paid from their pockets to receive English education.

Calcutta's Hindu College became a trusted source for supplying scientific Babus to the survey. The 1830 reorganisation of survey with George Everest at the helm required immediate use of the 'native agency'. Although field data were being collected by the British surveyors themselves, they had no time to sit down and reduce the data. Arrears had in fact piled up for the previous eight years. It was therefore decided to set up a computing office as distinct from the field staff. When the government expressed the hope that "all requisite computers may be drawn from existing establishments under this presidency", Hindu College was ready to fulfil it[5d]. (Hindu College was taken over by the government in 1855 and renamed Presidency College.)

Offer of employment as computers was sent to a number of students; salary was to be Rs 30 per month during a six-month probation, then Rs 40. Radhanath Sickdhar and six other students of Hindu College joined at the end of 1831. Sickdhar's case is well known. Exceptionally brilliant, he was made a sub-assistant at GTS after his probation at a salary of Rs 107 per month. He was then 19 years old. He rose to become the chief computer when he was transferred to Calcutta in 1849 to hold charge of the computing office. He retired in 1862 and died in 1870. A bachelor, Sickdhar became thoroughly

European in outlook, and began to take English food. "Colonel Everest was at first dissatisfied but afterwards admitted me in his own table[5d].

A legend has grown that the height of Mount Everest was computed by Sickdhar. This is no doubt an attempt to push the most deserving peripheral native into a nuclear role. Unfortunately, the story is not true; the height was calculated at Dehra Dun, after Sickdhar had been posted at Calcutta[5d].

The career-graph of other computers is instructive. After seven years of service, six were still getting only Rs 40. Five of them quit in 1838 to accept the newly established post of deputy collector in the revenue department. The seventh one, Nil Comul Ghose, who was getting Rs 100 per month also left. The GTS recruited another Indian, Ram Dayal De as a sub-assistant in 1840, but dismissed him in 1844.

The surveyor-general's office naturally took interest in the science teaching at Hindu College. A European computer and sub-assistant, Vincent Louis Rees, was entrusted with the task of "helping in the training of the Bengali computers". He also taught mathematics at Hindu College, from where he earned a salary of Rs 300 in addition to his GTS salary of Rs 318 per month. The science teaching was apparently not substantial. 20 years later, in 1855, Mahendralal Sircar, much interested in science, left the Presidency College to join the Medical College, saying[12] that "the principal object of education was to teach the pupils how to read and write the English language".

While in general Indians were kept out of actual field survey work, there was one type of survey which they alone could do. And that was the surreptitious survey of the trans-Himalayan regions, where Europeans would have been immediately spotted and killed. This work was of great strategic importance, and necessary to fill the gap between the Indian and the Russian surveys. With characteristic British thoroughness and disdain these surveyors were only taught how to take the observations; they were not taught how to reduce the data lest they cheated. When they were exceptionally useful, they were rewarded with scientific medals, khitabs, and jagirs. Otherwise, even their names are not recorded, they are indicated merely by capital letters[7,13].

It will be appropriate here to give some details[7,13]. "During the year 1876 one of the trained native explorers of the Great Trigonometrical Survey named 'the Mullah' ascended the Indus river from the point where it enters the plains of the Punjab at Attock to the point where it is joined by the Gilgit river". In 1877 "M.S., a native gentleman of the Muhammadan faith, and of much repute among his co-religionists" explored the areas beyond Hindu Kush. He was presented with one of the two medals which were placed at the disposal of the surveyor general of India by the Venice International Geographical College for award to meritorious native explorers. We do

not know the name of this gold medalist, but the case of Nain Singh and Kushan Singh is well known. They were called Pandit brothers. They are however, neither Pandits (in the sense of caste appellation) nor brothers (they were cousins).

A native officer of the survey, sub-surveyor Imam Baksh Bozdar took part in eight different expeditions during 25 years of his service. On his retirement in 1884 was given a grant of 250 acres of land in the Dera Ghazi Khan district (now in Pakistan), and the title of 'Khan Bahadur'.

The establishment of astronomical observatories [8,9] at Lucknow (1834), Trivandrum, and Hyderabad (1901) by Indian aristocracy also rightly belongs to the peripheral native stage, because although the ownership was Indian, the control was European. Lucknow observatory closed down as soon as the instruments and novelty wore off. Trivandrum met similar fate as far as astronomy is concerned, but being close to the magnetic equator, provided valuable magnetic data. Hyderabad observatory was attached to the Osmania University and had a rather unspectacular existence.

Except for clandestine activities outside the boundaries of British India where ethnicity was a crucial factor, the role of Indians in the scientific pursuits remained peripheral. However, as the needs of the Empire grew so did its perception of the abilities of the natives. The scientific content of the British administration in India increased steadily and with it increased the role assigned to the Indians. At the first step the natives moved from being coolies to calculators. In the second they graduated to become doctors and engineers to work in the network of railways, telegraph, roads and canals.

The British timed their operation well. When upper Ganga canal was being dug, an engineering college was set up at Roorkee. When wood was needed for the railways, a forest school was opened at Dehra Dun. It is no wonder that the British emphasised higher education among selected Indians rather than removal of mass illiteracy which would harm their interests. The sahib's faith in the baboos was fully justified. During the 1857 upheaval it was an Indian, Sibchunder Nandy, who kept alive the vital telegraph link between Calcutta and Bombay.

The simultaneous use by the British of science as well as the natives brought the two into contact. This point is tellingly brought out by the contrasting case of two 19th century Indian astronomers.

Samanta Chandrasekhar (1835-1904) [15,16] was born in the small village Khandpara, some 50 to 60 miles west of Cuttack. The only astronomy he could learn was the pre-telescopic one. Following in the footsteps of Bhaskara (b AD 1114) and using primitive instruments he completed at the age of 30 his *Siddhanta Darpana*, containing 2,500 Sanskrit 'shlokas' of various metres, including 2,284 of his own composition. He was looked down upon by his

Khattiyya clansmen, including his nephew, the king, for taking to a brahmanical profession. The raja of Puri bestowed on him the titles Harichandana Mahapatra. In 1893 the viceroy issued a 'sananda' conferring on him the title of Mahamahopadhyaya, a title normally reserved for Brahmins. A year before his death, he was sanctioned a monthly pension of Rs 50 "in view of the high social position of the Maha-mahopadhyaya", with the viceroy explaining to the secretary of states for India [16]

the case being a curious and interesting one of devotion to learning for its own sake and the lieutenant governor believes that Government in honouring such a student will honour itself. The grant of a pension to such a student would be entirely in consonance with native feeling. We regard the pandit's work as no means devoid of interest and even value since it throws light upon the beginning of astronomy, by showing what can be done by primitive instruments.

In later years Samanta Chandrasekhar did see through a telescope, and bitterly regretted that he had not had the advantage of such an instrument in his younger days [15].

In sharp contrast stands the case of Chintamani Rapoonatha Chetty (1828-80) [8,9] who was the son of an assistant at the Madras observatory. He joined the observatory as a daily wage when still a teenager and rose to become the first assistant with a monthly salary of Rs 150. His 1867 discovery of a variable star R Reticuli is the first recorded discovery by an Indian. This earned him the fellowship of the Royal Astronomical Society. He set out to update the elements of traditional 'panchangis'. He compiled a work in Tamil entitled *Jyotisha Chintamani* (he did not know Sanskrit). He also published an almanac *Drig garita Panchanga* with the help of the *Nautical Almanac*. Chetty gave public lectures on astronomy and brought out a book on the 1874 transit of Venus. This book explains the phenomenon by a dialogue between a pandit and a 'vidvanti' (an astronomer). Originally written in Tamil it was translated into English and other local languages including Urdu.

It was only natural that while serving the scientific interests of the British, Indians should think of responding to science on their own. This takes us to the third stage of growth of science in India.

INDIAN RESPONSE STATE

Conquests in India made Britain self-conscious. India had been a fabled country, its subjugation was seen as a proof of the superiority of the British way of life. The British therefore set out to impress their values upon the Indians. There were practical considerations too. India was already a thickly populated country, where permanent white settlement was out of question. And after the disastrous Portuguese experience Britain had no intention of producing a nation of half-castes. It was, therefore, essen-

tial to involve Indians in the task of ruling over India. Thus inherent in the British rule was the preparation of Indians to eventually overthrow that rule.

The preparation, slow as it was, started quite early. In 1774, the company established a Supreme Court of Justice at Calcutta. It was a revolutionary concept. For the first time in the history of India, there was now a framework of law which did not depend upon the personality of the ruler. Indian lawyers would provide valuable leadership in the years to come.

The offshoot of the introduction of judiciary was even more momentous. It became essential for the company to familiarise itself with the Hindu (as well as Muslim) law [17]. A digest of Hindu law was prepared from the 'pandits', but no one could be found to translate it from Sanskrit into English. It was, therefore, first translated into Persian and then into English. It was thus clear that Sanskrit was not an entirely dead language; it had a utility value also. This convergence of the practical need of the company and the scholarship of Sir William Jones brought about the all-European Asiatic Society in 1784, which initiated researches into Indology (Indians were not admitted till 1829).

Moreover, European men of science were fascinated by the mastery of the 'pandits' in preparing astronomical almanacs even without knowing the why of it. Thus John Warren, a former Madras astronomer and a blue-blooded French nobleman descended from Norman the Conqueror, took up a monumental project on south Indian systems of time-keeping. The work won approval from the 'pandits' who named it *Kaala Sankalita*, and showed their appreciation by offering to pay the expenses of the wedding of Warren's daughter. Though Warren had started the work 'on a call of personal friendship, the Madras government decided to fund it for its practical value. It was felt that the work would make Indian calendars intelligible to the Europeans, facilitate a comparison of the European and Indian chronologies and thus be of service to gentlemen employed in the Revenue and Judicial departments' [18].

European interest in India's antiquity had far-reaching influence on the Hindus. The discovery of their past glory, as certified by the Europeans themselves, restored the long-lost sense of self-esteem of the Hindus and gave them the courage to look the Empire right into the eye. (It also created Hindu revivalist and increased their distance from the Muslims.)

During the first 100 years of their lordship over India, the British introduced the Indians to the English language and literature, to western thought, to India's glorious past, and to modern science, and education. It was now for the Indians to prove, to themselves more than to anybody else, that they as the inheritors of a great civilisation were capable of becoming full-fledged members of the world's science club.

It became clear to the Indian opinion makers quite early in the game that the English education being imparted to them was inadequate. Thus *The Hindu Patriot* wrote on April 6, 1854 "The end aim of their [native's] education is to make them either accountants or letter writers. The resources of the country will never be developed unless the children of the soil learn to develop them"

The role of science as social reformer was also noted. Rajendralal Mitra (1829-91), who later became the first Indian president of the Asiatic Society, wrote [19] in 1854 that "practical training will be an effectual means for the removal of those barriers to progress which have been created by the ancient system of confining the cultivation of industrial art to particular classes, and those the least educated in the community". Mitra had just established an Industrial Art Society where Indians could learn practical skills [20].

Here was thus an attempt to create an Indian infrastructure of science parallel to that of British India. Such attempts were few, half hearted, and ineffectual. The Bengalis believed that since they knew Shakespeare as well as, if not better than the British themselves, their edifice of science should be an extension of, and supported by, the British effort. 'Science application' was to be left to the government; it was 'science speculation' that needed cultivation.

The leadership came from Mahendralal Sircar (1833-1904) a poor orphan who owed his station in life to western education. As a 1929 biographical sketch [12] of him puts it "The object of Dr Sircar was not to establish a technical seminary and thus make his countrymen a nation of artisans and mechanics, but to diffuse among them the ascertained principles of western science in the hope that after mastering what had already been discovered by the Europeans, the Hindus might, in course of time, add their own discoveries to those of their fellow brethren of the west".

Sircar was a man of strong convictions and tenacity. An MD from Calcutta Medical College, he had the courage to face professional ostracism for his advocacy and practice of homeopathy (He charged Rs 100 a day for out-station visits). In 1869 Sircar came up with the idea "of a national institution for the cultivation of science by the natives of India", and enlisted the support of Sir Richard Temple, the lieutenant governor of Bengal and "a man of wide sympathies, deep culture and high education". Sircar "was well aware that official support was the only key to unloose the purse-strings of his wealthy countrymen. The enlightened middle class would support the project on merit. "But the merchant princes and landed aristocrats, hungry for title and fame, would slavishly follow the foot-prints of the official head of the province" [12].

Finally, "after six years of restless pro

paganda" [12], the Indian Association for the Cultivation of Science (IACS) was inaugurated in January 1876. The rather peculiar name for a research laboratory needs a comment. In 1876 itself a political organisation of the educated middle class named 'Indian Association' was set up by Surendranath Banerjee. The IACS was the scientific extension of the political movement.

To Sircar's great disappointment, IACS failed to materialise as a research laboratory; it remained a forum for popular and college level lectures. In 1893 IACS was recognised by the Calcutta University as a teaching centre. Two eminent scientists of the day Sir Jagdish Chandra Bose (1858-1937) and Sir Prafulla Chandra Ray (1861-1944) lectured at IACS though they carried out their research work at their own college, the Presidency College (on retirement Bose set up his own research institute). Another visiting lecturer was Pramatha Nath Bose, a senior government geologist [10]. Bose is a good example of the transition from the 'peripheral stage' to the 'response stage'. On his retirement from the Geological Survey of India P N Bose was offered appointment by the maharaja of the mineral rich state of Mayurbhanj. It was Bose who educated Sir Jamsetji Nusserwanji Tata on the iron deposits of the area. This resulted in the establishment of the Tata steel mill at Jamshedpur [10].

The lesson was not lost on the Tatas. They set up a technical university at Bangalore, calling it Indian Institute of Science, because the word university at that time had the connotation of being no more than an examining body. The Bangalore institute, which admitted its first students in 1911, represented the first investment of 'Parsi money' for a general cause, and that too outside the Parsi mass base of Bombay. The choice of Bangalore was made possible by the munificence of the maharaja of Mysore, whose inspector general of education Hormusji Bhabha, (Homi Bhabha's grandfather) was related to the Tatas by marriage. Here the control was British, though the students were Indian. (Interestingly this technical university established by the Tatas in the heyday of the British imperialism was named Indian, whereas the research institute set up on the eve of India's independence was named by the Tatas after themselves).

While the 19th century IACS had failed to take off as a research laboratory, it came in handy for Chandrasekhar Venkata Raman (1889-1970), a teenaged Indian government official to do part time research in physics that led to a Nobel prize. At about the same time Calcutta University was transformed into a postgraduate studies and research centre by Sir Asutosh Mookerjee (1864-1924) [21] who was the university's honorary vice-chancellor during 1906-14 and 1921-23. Mookerjee was appointed a high court judge in 1904. Earlier he had written research papers in mathematics under his pre-anglicised name and had given lectures at

IACS. He turned to law only when he failed to get an appointment at IACS (which had no money) or at the Presidency College (which would not offer him the same status and pay as it did to the Europeans). As vice-chancellor, Mookerjee persuaded wealthy Indians, especially lawyers, to make endowments to the university for setting up (1914) the University College of Science and Technology where the professorships would be held by Indians themselves. Raman resigned his government job to become a professor at the university, in the process his salary went down from Rs 1,100 to Rs 600 per month [22].

The pinnacle of Indian response to modern science was the path breaking work of Raman, Megh Nad Saha (1893-1956) and Satyendra Nath Bose (1894-1974). It is important to keep in mind that these spectacular achievements were made possible by a fortuitous combination of factors. Those were the days when frontline research was just a short step ahead of MSc level studies. Thus Saha and Bose translated Einstein's German research papers on relativity for use as course material (This was the first translation of Einstein into English). Secondly experimental sciences were at a stage where they required elementary infrastructural support. Industrial back up needed for researches of J C Bose, P C Ray and C V Raman was easily available in the country. It was science application under the aegis of the British Indian government that made science speculation by Indians possible. Finally the take off stage of modern physics coincided with the peaking of Indian nationalism. Science was seen by Indians as an extension of their freedom struggle. Making scientific discoveries requires a certain amount of defiance. The oppressed anger against the colonial rulers provided that defiance.

Paradoxically while Indian achievements in science were perceived as a symbol of nationalism, at the same time the honours bestowed by the colonial rulers were coveted and even flaunted (P C Ray is probably the only exception).

The most extraordinary example of Indian response to modern science is the college dropout, creative mathematical genius Srinivasan Ramanujan (1887-1920) whose introduction to modern mathematics at the age of 15 began and ended with Carr's *Synopsis of Pure Mathematics* which a friend borrowed for him from the library of the government college at Kumbhakonam [23]. Fortunately, there were around men of science who had the sense to put him in touch with the mathematicians at Cambridge.

A corollary of sciences being treated as an extension of the nationalist movement was that it was seen as a pure intellectual exercise, rather than as a means towards the production of wealth. Thus J C Bose refused to patent his discoveries [20], and when patents were obtained in his name refused to encash them. Later when Sir Shanti

Swarup Bhatnagar (1894-1955) received a large sum of money from industrial consultancy, he gave it away to his university, maintaining [24], in the words of his son, that "scientific work loses its altruistic and truly cultural character if the worker becomes money-minded and begins to get financial benefits for himself". The only exception to science-as-a-cultural-activity syndrome was P C Ray who advocated the coupling of scientific research and industrial production, and himself set up a number of production units.

It is interesting to note that science meant different things to different people, depending upon their social and cultural background. To Raman, born in a caste associated with learning, science was a means of establishing a 'gurukul' on his terms. To Saha, born in a caste considered socially backward, science was an instrument of social change. To Homi Jahangir Bhabha (1909-66), born outside the caste structure but like Nehru an aristocrat by upbringing, science meant building national institutions under the auspices of independent India's government.

CRITIQUE

We have argued that the production and growth of modern science in India was encouraged by the British with a view to furthering colonial interests. Thus the British sponsored science by the very reason of its existence, was field science. Geography, geology and geodesy, botany and zoology, archaeology, medicine and even astronomy—all these stemmed from the physical and cultural novelty of India. This science was colonial in the sense that its agenda was decided on grounds of political and commercial gain. But the studies made in India could not have been carried out anywhere else. The European scientists at work in India felt and acted like pioneers in an exotic land and were not always on the best of terms with their counterparts back home.

The role assigned to the Indians in this state science was clear-cut. They were to provide cheap labour which they did most conscientiously. Since the natives generally knew their place, there was a general encouragement to them from their British bosses. Lambton, and then Everest, took good care of their staff. Everest got a native Syed Mir Mohsin Hussain (who did not know English) appointed as the head of the mathematical instrument department and insisted on his being given the same designation as his British predecessor, if not the same salary. The Madras astronomer continued his chief assistant Ragoonatha Chetty in service (even after he had become senile) so that he could get full pension benefits.

The westernisation of the Indian middle class was as much a matter of satisfaction to the British as was the physical subjugation of India. It was to be expected that an Empire would show some respect for the

Republic of Science. When the Indians decided to do science on their own initiative, they received encouragement, if not money, from the British. Thus J C Bose was retired on full salary, and Raman was knighted before he got 'Nobelled'. The success of the British in projecting themselves as the patrons of science as well as of the Indians can be seen from the fact that even today Ramanujan is introduced as the first Indian Fellow of the Royal Society, while in reality his fellowship is more a tribute to the good sense of the society than to him.

We have distinguished here between European scientists engaged in government science, their native scientific assistants, and the Indian scientists who were full-fledged members of the 'Club of Science'. Our model differs from the one given by Basalla [25], which romanticises science and trivialises the compulsions of colonialism. The development of science and technology in the west did not take place in a vacuum. It was directly linked to the colonisation of India, which financed the whole exercise and in return received fringe benefits.

Marxism and Crisis of Communist Ideology

Kian Tajbakhsh

RAJENDRA PRASAD's questioning of the historical relationship between the ideology (marxism) and organisation (the party) of the communist movement in India and elsewhere in 'Communist Theory and Communist Parties' (*EPW*, March 30), raises a number of issues of central importance for a progressive political agenda today. He poses the question of whether intellectuals within the party have a legitimate space for theoretical discussion and innovation. In other words: who has the right to interpret Marx? He implicitly critiques communist parties which by being closed off to constituencies, issues and theories that have emerged from the 'outside', have all too often been an obstacle to further theoretical development.

But this raises a further set of questions. Either his critique refers to the tendency towards ossification of organisations in general irrespective of their ideology—in which case it tells us little about the specificity of Marxist/communist parties. Or there is something particular to Marxist parties which gives them this tendency towards rigidity and dogmatism—in which case we have to look not only at the organisational form but the theory articulated with it. The first case would require a comparative sociology of organisations. The second option leads us to consider the theory of Marxism itself. I propose to follow the second path. I want to radicalise the critique of organisational form and focus on the discourse of Marxism itself, for it is there that I believe that the crisis of communism lies. The following brief remarks are intended to contribute to the reinvigoration of a democratic and socialist project, not bury it.

A recent article examining the "confusion and demoralisation" of the Indian left, concluded that, "at its roots the crises facing the Indian communists is one of the crises of communist ideology itself". Few people today would disagree. Marxism's strength lay in its claim to be a critical theory with practical intent: a theory, in Marx's famous phrase with which to not only understand the world, but change it. If Marxism's claims are no longer convincing, what is at the root of the crisis? I will attempt an answer by looking at three themes: the Marxist concept of class and politics, its usefulness as a guide to economic, political and social policy, and its prophetic vision of a future society.

Since we immediately run into the problem of what Marxism 'really' is, I want to make the simplifying assumption that Marx meant what he said and propose the following as a working definition. Despite variations, all Marxisms must share one fundamental claim; that the emancipatory political project (however defined) of contemporary society (however defined) is

rooted in a single agent, the working-class (however defined). In other words, it privileges one political identity, (the working-class) anchored in one type of activity, praxis or labour, as constituting the agent of socialist transformation and the addressee of its discourse. Marxism (a way to change the world not only to understand it) stands or falls with the viability of this position.

THE QUESTION OF 'CLASS'

Marx's fundamental concept was that of 'class'. It provided the key for the diagnosis of modern society and inequality: capitalist society (including forms of politics and ideology) was based on the economic exploitation of one class by another. It provided a practical-strategic guide by identifying the group that could liberate itself and all of society from this oppression: a unified, conscious *working class* acting 'for itself'. And it provided the philosophical-utopian vision for the future liberated society: the free association of the *producers*, a *workers' democracy*, engaged in *unalienated labour*. Together with a theory of history as a series of class struggles, and of human nature constituted through the 'praxis' of human labour, this vision added up to more than a theory—it provided a formidable worldview inspiring the international communist movement, workers' movements in many countries and countless other struggles against oppression and inequality. But there are at least three reasons—conceptual, empirical and normative—to think that this framework can no longer provide a guide for a progressive politics in the contemporary world.

For Marxism 'society' is conceived of in the well known metaphor of an economic base and a political/ideological superstructure. The 'real material' base, in which economic classes of proletariat and capitalist confront each other, determines the superstructural elements of the state and of ideology. Liberal democracy is really bourgeois democracy, and the leading ideas of society—say, talk of morality or legal rights or freedoms—are the ideas of the ruling class. This theory thus *privileges* the economy, the relations of production, in two crucial ways. First, private property is privileged as the conceptual key to unlock the real basis of political forms. Second, the actors in that sphere, the working-class, are privileged as the bearers of a progressive politics and a socialist—that is to say emancipated-society, identities such as caste, gender or nationality are therefore secondary for the socialist project.

If it is pointed out that politics and ideologies can in turn determine and affect the development of the economy, the

response is that politics and ideology have a relative autonomy from the economic base but are 'in the last instance' determined by them. But as a theoretical proposition this is incoherent: something cannot possess (any) autonomy if it is ultimately determined by something else. As soon as it is admitted that in principle, any sphere of society can affect any other, then this use of the metaphor of base and superstructure loses its meaning. Two conclusions follow. First, political processes and ideologies cannot be analysed as reflections of class processes; and second, no one identity has an *a priori* progressive character: we do not know in advance the 'objective' interests of any group. In this case the proletariat as the gravedigger of capitalism has no coherent theoretical justification.

We can perhaps add a brief note regarding the question of the party and organisation. It should be clear from the above that the concept of objective interests is fundamental to the Marxist political (world-historical) project and is the basis of its claim as a 'science'. But if interests (such as a factory worker's interest in overthrowing capitalism) are objective, who then has access to this knowledge? And what if 'this or that proletarian' is not aware of this interest? It is not difficult to see that once interests are defined in a cognitive rather than discursive form, then an institution or persons can claim to possess this knowledge. From here, there is a strong tendency towards the guardianship by a group of leaders of what is or is not in other people's interest. It is in this way that a certain rigidity and dogmatism, although not inevitable, is strongly present as a possibility within Marxist discourse. Once the moral or normative questions of right/wrong, good/bad are assimilated to epistemological questions of truth/falsity, then the sphere of democratic public discourse is trimmed down to the domain of intellectuals either possessing or not possessing the 'truth', whatever the content might be.

Returning to our previous point then, we can say that the conceptual identification of the objective agent of revolution cannot be a scientific operation of 'discovery'.

But let us suppose that there were no conceptual difficulties with the idea of the primacy of the economy and the working-class. Could these propositions find empirical support? The Marxist notion of class struggle was always accompanied by a sociological hypothesis: as a result of the laws of capitalist development "society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other—bourgeoisie and proletariat". This is because industrialisation would bring together masses of workers at the point of production and modernisation would diminish the importance of 'traditional' types of association (such as religion, community, ethnicity) for those who must enter the labour market to survive. (This latter conception is also shared by many liberals who argue for ex-

ample that caste divisions hide the 'real' economic, bread and butter issues.)

Not only has this simplification of the social structure not occurred but there is strong evidence to suggest that 'the lack of homogeneity of the supposedly normal category of the standard employee is not a remnant and residue of pre-modern social structures but is in fact, created in the process of modernisation itself'. Examples such as the distinction between the so-called informal and organised sector labour markets created in part through the introduction of new technologies and skill requirements, and the enhanced ability of administrative and political structures to target specific employment groups (such as in reservation policies), are all indications of labour market segmentation as modern phenomena.

Therefore the anticipation of a conflict between two homogeneous collectivities—the basis of class warfare—has little empirical support. Rather the experience of deprivation is characterised more by multiple and overlapping cleavages that run both across social classes and through individuals.

But let us suppose that there were neither empirical difficulties with the idea of a unification of a 'working-class' nor conceptual problems as discussed above. Would a progressive agenda today want to pursue such a project of proletarian revolution? This normative dimension has been put in to sharp relief by, above all, two experiences: the communist bloc countries and the proliferation of struggles (both in India and elsewhere) such as the women's, racial and ecological movements that go beyond the confines of a working class identity.

Marxism views human nature as constituted in the reciprocal interaction of 'man and nature' through the process of production. In a fundamental sense what it means to be human is embodied in that act of labour. But where labour is now alienated from 'man' emancipation means the return of these essential powers back to 'man'. It is not arbitrary then that the utopian vision inspired by Marxism has centred around the ideas of a classless society, the association of the free producers, unalienated labour, the dictatorship of the proletariat, workers' democracy based on factory councils and so on.

But we may ask: why just a workers' democracy? The response: since everybody will be a 'worker' this can only represent the universal interest. The problem with this is not only the practical issue of there being groups outside of employment but the more worrying idea that humans are fundamentally given by one identity, which will be revealed in the future society. For one of the cornerstones of any society that wishes to expand options and allow individuals to explore diverse identities, is the defence and encouragement of *difference* and plurality, both within individuals as well as between groups. Indeed, the very project of linking the universal interest with any single sociological group (be it a class, caste, gender or whatever) is no longer a convincing basis for a radically democratic and pluralist project.

Any progressive movement that wants to take democracy seriously must take dif-

ference seriously. But instead of fostering an idea of a radical pluralism, Marxism has tended to do the opposite. Is it an accident that other identities and struggles, such as gender and caste, have been so absent from the theory and practice of communists and Marxists? If not, then the adequacy of the theory employed by the left must now be seriously questioned.

MARXISM AND POLICY

Why has the left been unable to provide a plausible set of policy alternatives in theory or in practice for the complex of issues relating to the economy or the state in contemporary societies? Any movement that wishes to influence the directions and contents of policy decisions to appeal to a wide base of support for these policies, and not surrender the field to neo-conservative and authoritarian agendas must provide a coherent analysis and strategy for the reform of the economy and the state.

For the last 150 years Marxism has set the terms of debate for the left concerning two central policy issues: the economy and the state. The criticism that it has focused on the negative effects of the market and the misuse of power has been indispensable and arguably without peer. Nevertheless it has been unable to fulfill its own claims to see them both in their negative and positive aspects. This is because Marxism views these modern institutions in a way that leads to their categorical rejection instead of a selective appropriation. *The market* is viewed as the site of profit-seeking capitalists; as the arena where an otherwise co-operative community of workers are pitted against each other through competition; and above all as the expression of the underlying *class* relations of exploitation. Money is the reified symbol of alienated human labour power made abstract. And the *state*, in the well known words of the *Communist Manifesto* is but a committee for managing the common affairs of the whole bourgeoisie since the latter has conquered for itself in the modern representative state exclusive political sway. The institutions of the modern democratic state—parliament, judiciary, bureaucracy, rights, etc. are therefore expressions of *class* rule. They mask what is in essence bourgeois democracy.

Now what is common to both these positions is their totalising character. They suggest that in the market and the state, we are confronted with *nothing but* the manifestations of the latest version of class rule and oppression. Traditional feudal social structures have largely been (or will be) destroyed by capitalist development and have given way to these new forms of exploitation and alienation. But it is totalising because from this perspective we are unable to distinguish between the destruction of traditional forms of life on the one hand, and the distortion of post-traditional forms of life on the other.

The market and the state are areas of social life that have been differentiated out from other social processes, crystallising into 'quasi-natural' systems with their own laws and logics. This is what we mean when we say for example that money and the

economy 'work behind our backs', through the famous invisible hand and that political parties or bureaucracies develop their own momentum and interests. On the one hand, through this autonomisation, these subsystems achieve a greater level of efficiency and complexity—in the regulation of economic activities or the administration of social life—as a result of internal specialisation and rules of operation.

On the other hand, Marxism views these historical results with suspicion. It correctly highlights the pathological effects of this development: e.g. economic crises, material impoverishment, the tendency of democratic bodies to ossify or represent only particular interests, etc. However, it cannot theorise the positive *potential* of the increased 'rationality' of a market co-ordinating vast and complex economic activities thereby harnessing greater material productivity. Similarly, it cannot theorise the positive *potential* of the greater rationality of autonomous political and administrative abilities in organising (some aspects of) social life under universalistic principles. In fact Marxism views the separation of the economy and the representative state from the control and concrete interaction of a community of individuals as a sign of the alienation of social life.

Since they are both seen as expressions of underlying class relations *only*, and if revolution means the elimination of these relations of exploitation it logically follows that revolution also means the elimination of the institutions of the market: representative democracy, specialised bureaucracy, etc., *in toto*. The functioning of the economy and the state should be absorbed back into community life itself. Direct democracy comes closest to capturing this alternative: the association of the free producers will organise collectively both society's labour and production as well as the administration and legislation of rights, conflicts, etc. without the mediation of differentiated institutions of the economy or the state. It is not coincidental that Lenin would claim that after the overthrow of capitalism 'any cook can govern'. Nor is it coincidental that socialists for so long have turned red at any mention of the market, as a concession to capitalism.

It should now be clear why the left, in or out of power, has been so much at a loss when confronted with policy questions concerning liberalisation, privatisation, increasing government control, etc. The historical experience of the centrally planned economies provide strong evidence that markets cannot be eliminated without severe disruption of economic efficiency. And the experience of recent movements against the welfare states of western Europe and United States and criticism of cynical 'vote-banking' by Indian political parties, demonstrate that the use of state power to organise many aspects of social life in addition to the economy produces its own crises.

But the left approaches the question of the market and the electoral system in an *ad hoc* manner faced with the inertia of money and power as principles organising social life, the communist parties engage in economic policies and contest power

through elections all the while denouncing both as capitalistic and a bourgeois sham. This incoherence has not helped these parties' credibility with their potential constituents. The left's reliance on Marxist and Leninist assumptions about the economy and the state appears therefore more as an obstacle than an aid to a renewed vision of a radically democratic, pluralistic and socialist agenda.

LEFT, UTOPIA AND REVOLUTION

Mario Vargas Llosa recently remarked that in politics utopias are a very dangerous thing. Utopian thinking has produced great individuals and works of creative genius. But in politics (his main target being Marxism and communism) the striving to realise an ideal system leads to a failure to confront problems of the present. This can only lead to disaster, as the experience of the communist model allegedly shows.

Now while we are not forced to accept the neo-conservative alternative of the 'end of history' so popular today, I do believe that it is incumbent on socialist to question the utopian revolutionary discourse of much radical thinking. The humanitarian and egalitarian aspects of the Marxian socialist tradition are vital to any renewed radical movement. But two elements in particular in the socialist project are problematic and require revision: the totalising character of Marxist theory and the Jacobin strategy of revolutionary rupture.

Marx was unable to deliver convincingly on his intention to analyse history dialectically, that is to acknowledge the positive contribution of capitalism to world history while identifying the means to transcend it. By making production the central category of social analysis, human nature and a utopian vision, two things follow. First, Marxism only recognises the increased material productivity of capitalism as an evolutionary gain over previous societies. Normative features such as law, forms of democratic opinion formation, religion, etc. are either reduced to the economic base or they are ignored. Secondly, by tracing the complexity of social phenomena and institutions back to the class processes of commodity production or wage-labour, even in the final instance, it becomes impossible to distinguish between contemporary society as a result of the destruction of traditional forms of life on the one hand, and the distortion of these post-traditional forms of life on the other. Since we cannot discriminate between institutions of modernity and their bourgeois versions, then any post-bourgeois order must necessarily mean a total and apodictic break from the present. This 'Jacobin' imaginary has been the foundation of the usual distinction between reform and revolution: anything short of a root and branch transformation is merely reformist, a selling out.

But this totalising perspective has led to a paradox. By devaluing as it were, the present, this leaves only two contrary, and equally inadequate, options for the transcendence of contemporary alienation and social oppression. Either through a utopia of the past which romanticises

previous forms of social organisation, captured in such slogans as 'back to nature', 'small is beautiful', and so on or alternatively, through a utopia of the future which imagines a society entirely discontinuous with the present. This double utopian flip-flop is the paradox faced by totalising rejections of the present.

Now if we reject these two options, several conclusions follow. First, the reform/revolution distinction—in its traditional meaning of demarcating reforms which lead to 'real' social change from those which do not—must be discarded. In principle, any reform must be evaluated in its own terms and can be articulated within a larger political project. The mythology of proletarian revolution cannot be counterpoised to social democratic reformism. A radical democratic project must try to extend and deepen egalitarian and universalistic principles of argumentation and consensus formation in a reactivated public sphere that is sensitive to the multiplicity of particular traditions and cultures. This greater reflexivity encourages the equal participation of groups and individuals. This means, secondly, that in principle any area of society—not only the economy or the state—can be a site of the radical contestation of power. A renewed emancipatory project must embrace as many struggles as possible: class, gender, caste, ethnicity and so on. It cannot be restricted to a socialist working class project alone.

A further consequence of this 'multiplicity of the social' is that the idea of society as a kind of macro subject with a fixed centre—either in the economy or the state—

must give way to the idea of an open multinodal complex that cannot 'direct itself' along the liberal or social democratic model, i.e. by means of the market or the state. Society developed a certain self-consciousness as it were when it became clear that the economy had split off and that its crisis tendencies needed to be controlled. This universal will embodied in the (Keynesian or socialist) state would then regulate economic life. But it has now become apparent that not only is the economy not amenable to this kind of control without loss of economic rationality but the state itself has split off with its own momentum and dynamics and must be controlled in its turn. The type of institutional arrangement that can address these problems is one of the challenges facing the left today.

What then of utopias? Is there a way to reconcile the recognition of some present institutions as necessary for a democratic society with a vision of the future as distinct from the present? A project of creating a public sphere that is open to the multiplicity of cultures and identities; is sensitive to the destructive effects of the economy and the state yet able to steer these spheres in a direction that itself does not endanger the increase in options that they can bring, requires a normative orientation that is more procedural than substantive and that no longer sees this as anchored in one single mechanism of money (market), power (state) or community. The way these three institutionalised 'resources' are brought into synch with each other is a challenge that the left faces today.

OUTSTANDING BOOKS

HUMAN RESOURCE DEVELOPMENT & ENVIRONMENT

R.D. Sharma (Editor)

Offers a collection of important papers in the field of Environmental Technology, Environmental Health, Environmental Psychology, Environmental Management, Environmental Education and Environmental Conservation.

1991

August 24, 1991

The Budget and Structural Adjustment

The fiscal management undertaken in the budget for 1991-92 raises a number of important issues. Is the finance ministry's perception of the impact of the fiscal parameters on macroeconomic variables correct? Do the proposed steps constitute the right cure for the macro imbalances? And, finally, does the budget try to minimise the costs of adjustment without sacrificing the basic short and long run objectives?

1977

Against the background of recent economic policy measures which will be highly inflationary, will slow down investment and will hurt the poor, the budget leaves the larger issues in the fiscal sphere unaddressed

1993

The likely impact of the budget has to be judged along with the effects of the devaluation, the compulsion to increase exports, the pressure of increased costs on prices, the likely increase in foodgrain procurement prices, the lagged effect of past inflationary pressures and the impact of the relatively weak monsoon

1989

The budget proposals are surprisingly cautious in carrying forward the liberalisation programme in the area of fiscal policy

2005

The budget's response to the *Economic Survey's* call for a "serious effort to introduce corrective measures through hard decisions and difficult choices" is a feeble one

1999

To bridge the gap between domestic saving and investment there was need for a purposive attack on 'dissaving' by government and a serious effort to increase the savings of the community by stimulating 'local area planning' through devolution of both authority and finance. The greatest failing of the budget is in these areas

2011

Elitist Model

The notion of democracy which informs both the prevalent models of development—the Nehruvian one and the market oriented one being implemented today—is an instrumental, elitist one and this has contributed to discrediting the political system

1953

Learning from Nomura

The startling revelations about the doings of the two largest Japanese securities houses whose heads have been forced to resign, hold many lessons for us

1948

Chunduru Massacre

Economic disparities do not provide a sufficient explanation for the massacre of Dalits in Chunduru in Andhra Pradesh earlier this month

1967

Drug Policy

Not many people are perhaps aware that the government's drug policy which affects the health of millions of people, is formulated not by the health ministry but by the ministry of fertilisers and chemicals

1963

Economics of It

The aspirations of the emerging middle bourgeoisie in the Hindi heartland may be one reason why the BJP's demand for ending Article 370 in respect of Kashmir is getting wider response

1959

Price Signals

The latest price trends bear the clear imprint of the devaluation and the budget proposals

1957

Unprotected

Indian laws, criminal or labour, offer little protection to women against sexual harassment at the workplace

1965

After Apartheid

The legal scaffolding of apartheid is being rapidly removed, but few have begun to face up to the costs of real social change in South Africa

1971

Threatened Monopoly

Rabindranath Tagore is to be linked from Viswabharati, the Vatican and the Pope are to cease to be inseparable categories

1951

Biased Interpretations

THE main point of the authors Geetha and Rajadurai (*EPW* June 29) seems to be that a party (DMK) which with all its shortcomings was trying to uphold anti-Brahminism and social justice and as far as the authors are concerned these terms are synonymous as well as Tamil nationalism has been done down by various reactionary elements (obviously reactionary since they were opposed to a party with all these virtues). But equally obviously to a majority of the electorate facing problems of poverty, lack of employment opportunities, growing law and order problems, urban stagnation etc., anti-Brahminism was not a sufficient rallying cry to vote for the DMK, and the report fails to make a mention of these factors even in passing.

Besides, what is Brahminism? Is it limited only to the Brahmins? Elitist casteism is not the prerogative of Brahmins alone as all accounts of attacks on Harijans in Tamil Nadu and elsewhere prove FVR quite rightly and justifiably focused on the Brahmin as the apotheosis of all caste-based domination in order to mobilise the underprivileged castes and to promote social reform, political parties have used this over-simplification for political purposes. But one would expect more depth and subtlety from reputed researchers.

One of the objectionable aspects of this kind of reporting is the use of value-loaded words to project a desired image. Thus if Brahmins write to the newspapers on issues which threaten (in their opinion) their identity, interests or survival, it is 'blatant casteism'. But are such channels not open to everybody to voice their concerns, whether valid or misguided? It is not clear by what norms of democratic functioning the authors think that such methods of articulation should be confined only to the chosen people who have seen the light.

A last note of protest (or even outrage) is directed at the self-proclaimed right of the authors to define 'Tamil' or 'Dravidian' culture as something from which Brahmins are automatically excluded, which not only shows a poor understanding of the history of Tamil culture and literature, but also raises questions of when and how cultural assimilation is accepted to have taken place in a pluralistic society. (If one were to take such xenophobia to its logical conclusion, all Dravidians should start getting ready to move back to Mohenjodaro and Harappa and all Aryans to the west, leaving India to the

'original' inhabitants!)

All these questions are raised with an ultimate sense of the futility of such protest, since the standard reaction to all counterquestion is to brand it 'casteist'. Sadly, the pursuit of dispassionate intellectual inquiry and debate seems to be lost amongst us.

KANAKALATHA MUKUND
Hyderabad

Reviving Shibboleths

IT is unfortunate that V Geetha and S V Rajadurai in their article on 'Dravidian Politics: End of an Era' have gone back to shibboleth to explain the defeat of Karunanidhi's DMK in the recently held Tamil Nadu elections. They see Brahmin hegemony, BJP conspiracy and Sankaracharya's evil hand in crushing the Tamil masses.

Geetha and Rajadurai do not seem to realise that Tamil Nadu is not Bihar and that elections have been free and fair with no element of booth capturing at all. To claim that the less than 3 per cent of the population (Brahmins) ganged up against the rest is ridiculous. Tamilians voted as Tamilians and they preferred ADMK (Congress(I) alliance) to the DMK (PM, CPI, JD, ML alliance). Where is the Brahmin hegemony? The foremost English daily from Madras, *The Hindu*, supported the National Front DMK alliance throughout. The popular newspapers, *Daily Thanthi* and *Malai Murasu*, are not Brahmin owned or run. Some of the leading Brahmin intellectuals of Tamil Nadu like S Guhan, N Ram and

V Athreya had supported the DMK-led alliance. If the ADMK-Congress(I) front fielded Brahmins in the elections, so did the DMK-CPI, JD, ML front.

For all practical purposes, Brahmin hegemony in Tamil Nadu died decades ago. Brahmins are like any other group with a few affluent, and many struggling to get on. It is not good political analysis to exaggerate their role or importance. That Jayalalitha is Brahmin born is more an accident than any indication of Brahmin hegemony. Had she been a Mudaliar or Chettiar or Vanniar or dalit, she would still have come to the top. That is the nature of democracy. People vote for those in whom they have confidence.

Finally, a word about the alleged articulation of subaltern interests by DMK. Let the authors go round Tamil Nadu villages and see for themselves what havoc DMK functionaries belonging to the dominant newly affluent backward castes like Thevars, Nadars, Vanniar, Gounders and so on, have done to the really downtrodden, i.e., dalits and the poor among the rest of the population. That almost every single woman's vote went to the ADMK Congress(I) combine tells its own story. If anything, the results of the Tamil Nadu election shows that casteist/communalist politics have been given a resounding negative vote. The real tragedy is the decimation of the left parties thanks to their opportunistic association with a blatantly anti-people casteist outfit like DMK and communal parties like MI (Lalith).

End of the Road?

CAUGHT between aggressive but foolish 'hardliners' on the one hand and crafty tacticians at the opposite end on the other, Mikhail Gorbachev's pragmatic exercise of socialist renewal appears to be inexorably heading to its unceremonious end. The direction of this trajectory was perhaps predetermined by many weighty variables in the complex concatenation in the historical situation: the ill considered misadventure of the 'gang of eight' has only hastened its pace.

When he had first issued the call for a 'societal revolution' at a small Siberian town about half a decade ago Gorbachev obviously had no inkling of the task he was going to undertake, more to the point as it appears to be clear now he had no more than the haziest definition of the task itself. In his simple formula of that time a combination of 'more democracy' and some tinkering with the economic productive mechanism was deemed to be sufficient to produce 'more socialism'. His professed ideological position notwithstanding he made no attempt at linking his 'revolutionary' exercise with the initiative determination and the long term interests of any particular class or segment of the existing Soviet society. If he was going to lead a revolution it was to be a revolution from above and he was obviously banking on success in doing so by guiding and herding an amorphous mass undifferentiated, in his reckoning, by their socio-economic interests, ethnic specificities or historical antecedents. The two basic instruments he seemed to be relying upon were the power of his 'new thinking' and the mass of the intelligentsia he was hoping to rope in by its appeal. When and to the extent the new thinking stirred the intelligentsia as well as other segments of the highly pluralistic Soviet population, they were propelled in different and in many cases, conflicting directions. While all along from the beginning of the twin perestroika glasnost process last accentuating material difficulties dogged its every step.

Without a solid and defined social base, without any systematic ideational frame of reference, without even any demonstration of firmness in their commitment to any set of fundamentals, Gorbachev and his team of associates resorted to manoeuvring, temporising and compulsively shifting their ground under pressures of growing social tensions. The resultant of this, what Engels would have called 'parallelogram of forces', was a continuous strengthening of the forces of the real right, that is, a reinforcing of the anti-socialist, pro-west trends. This, not unexpectedly, propelled a combination of disoriented left elements, those subjectively committed to the socialist frame, together with desperate *status quo*ists to make the

adventurist bid to stem the tide by the main force of a narrow circle of armed forces and the secret police. They have succeeded only in delivering Gorbachev into the close encirclement of their enemy.

Needless to say, the changes of the last five years have not succeeded in giving more socialism to the Soviet people. But their import is not quite inconsiderable for that failure. They have succeeded in creating more democracy, strong enough to snuff out the attempted coup from above. This democracy will have to enlighten and arm itself through a critical assimilation of history to usher in 'more socialism' in the days ahead. The one indication however that emerges with clarity from the still confused picture is that 'more democracy' is a precondition for all other projects, both political and economic. But for this to be made possible the consolidation of the many freedoms now available, by cohering them around organising principles, is crucial. Till such time political democracy remains open to the danger of being hijacked by either the so called Kremlin old guard or by the now triumphal forces of the right led by increasingly chauvinist elements, whose democratic commitment is certainly not beyond suspicion.

In this respect, a first step, insofar as there is an identifiable first step, towards the restoration of some semblance of order that is simultaneously consistent with greater democracy is the conclusion of an agreement that will establish, even on a temporary or *ad hoc* basis, the nature of future political relations between the centre and the constituent units of the federation. Inevitably in the changed circumstances after the developments of this week, a new union treaty will be marked by a further attenuation of the powers and the formal authority of the centre. But there is a good deal to be said for not approaching the matter from fixed positions in regard to what would constitute the 'break up of the Soviet Union'. Indeed at this juncture a formal agreement on the framework of relations between the centre and the republics is one—perhaps the only, instrument for imposing a modicum of restraint on Russian chauvinism led by a Boris Yeltsin on the rampage after his role in defeating the hardliners' coup. Further the devolution of near complete political authority will also automatically transfer the responsibility for economic management to the republics. The democratic process may put in place relatively coherent economic and political arrangements in the different units and the project for the renewal of socialism through struggles in civil society may then just be feasible.

FOREIGN DIRECT INVESTMENT

Foreign Exchange Drain

THE August 91 issue of the *Reserve Bank of India Bulletin* carries a report on the finances of foreign-controlled rupee companies in India for the period 1984-85 to 1986-87. It is unfortunate that the report is being published with a lag of over four years—longer than was the case for the study covering the preceding three years, 1982-83 to 1984-85. All the same, some interesting facts have been brought out and these are of relevance in view of the renewed emphasis being currently placed on foreign direct investment.

According to the RBI study, the net outgo in foreign exchange on account of these foreign controlled companies was only Rs 35 crore in 1984-85, Rs 116 crore in 1985-86 and Rs 235 crore in 1986-87. Thus not only did the foreign controlled companies in India fail to make a net contribution to the foreign exchange earnings of the country, but also the drain on their account increased almost seven fold within a span of two years.

When one probes this performance of the foreign controlled companies further, it emerges that the increased foreign exchange outgo is due very largely to the increased imports by these companies unmatched by corresponding increase in exports. In fact, in 1984-85, the export earnings of these companies were slightly in excess of the value of imports (Rs 646 crore as against Rs 621 crore). In 1986-87, however, the position was reversed and these companies' imports exceeded exports by Rs 158 crore.

The total net outgo in foreign exchange referred to in the earlier paragraph should be seen against the background of the total paid up capital of these companies of Rs 1,224 crore, of which actual investment in foreign exchange may not be more than Rs 500 crore. Indeed it may be closer to Rs 400 crore—and compare that to the net foreign exchange outgo of Rs 386 crore within a period of just three years.

The reason why foreign companies are in a position to effect such a substantial outgo, and that too at a fast pace is principally that on a relatively small base of investment in equity it is possible for them to undertake sizeable operations. This can easily be seen by a comparison of their equity of Rs 1,224 crore with their total liabilities of Rs 10,542 crore. More than half of the latter is accounted for by borrowings, from within the country, as well as trade and other dues.

The finance minister speaks rapturously of the prospects of Japanese direct investment of the order of \$ 2 billion. Will he

please clarify what exactly he has been assured of? Is it equity investment of this order that he has been promised? Or is it that the size of total operations envisaged by the Japanese may reach that figure? In the event of the latter, for an investment of \$ 200 million as the host country we will first have to mobilise the balance of \$ 1,800 million and then face the prospect of an annual outgo of \$ 100 million if not more. It is significant to note in this context that under the new industrial policy, clearance for direct foreign investment is predicated on foreign equity covering only the foreign exchange requirement of the project for importation of capital goods. Such clearance is to be conditional upon neither export performance nor net outgo of foreign exchange nor even the extent of total resource requirements of the project.

POLICE

Lock-Up Killings

SUPREME COURT judgments, protests in parliament, public demonstrations, nothing deters the police from killing people in lock ups. The latest incident in Delhi involved the torture and death of a middle aged man in the Patel Nagar police station lock up on August 19. This was reported to be the fifth such death in that police station in recent times.

Two years ago, the Delhi based People's Union for Democratic Rights (PUDR) made a detailed investigation into custodial deaths of 48 people in the capital, and exposed the brutalities indulged in by police personnel. Between 1980 and 1989 (the period covered by PUDR), the court intervened only on five occasions, while the police authorities suspended only 39 and transferred 16 of the guilty personnel. It is not known whether those suspended had actually been awarded any punishment for the crimes of which they were charged. Punishment of guilty policemen is a rare occurrence. But the Delhi Police Commissioner, in a bid to give a respectable face lift to his forces, at that time appealed for critical support from organisations like PUDR. He was even believed to have circulated the PUDR's report on custodial deaths titled *Invisible Crimes*—among all the police stations of the capital. It looks as if the station house officers (SHOs) and their subordinates have got the wrong signal from the report, which instead of having a sobering influence on them seems to have encouraged them. The information that hardly any of the guilty policemen had been punished in the past

had no doubt given a boost to the capital's cops.

Police torture and killing of arrested people are not confined to Delhi. In Andhra Pradesh, at least 104 people died in police lock-ups during 1984-88. In Karnataka, 34 such deaths took place between 1980 and 1988. Karnataka had an opportunity to put a brake upon such arbitrary killings. In 1986, during the Janata regime there, an unofficial bill was moved by an MLC of the party, which sought to amend Section 41 of the CrPC by providing more safeguards to protect the rights of an arrested person. The then Janata government treated the bill as an official bill which won the support of even the opposition parties. But following protests and pressures from the local police bosses, the state government put the bill in cold storage. It died a natural death following the dissolution of the assembly. The police argument (shared by their colleagues all over India) was that without applying 'third degree' methods, they could not investigate crimes!

But laws do not make any difference to police behaviour. Torture is already recognised as a criminal act which is punishable under Sections 330 and 331 of the Indian Penal Code. In spite of that the police can get away with killings in custody. One of the reasons for this is the protection given to the police by the laws again. No prosecution of the guilty police personnel can be launched without the permission of the police authorities themselves. Magisterial inquiries (usually conducted by an executive magistrate, and not a judicial magistrate, in places like Delhi) invariably acquit the guilty policemen. Even when prosecutions are launched by the police against their guilty colleagues, charges are often changed from murder (under Section 302 of the IPC) to attempt to commit culpable homicide (under Section 308 of the IPC). In the recent case of custodial death in Delhi, the police at first registered it as one of culpable homicide not amounting to murder. Only public pressure forced them the next day to register it as a case of murder and wrongful confinement. Even if the guilty police personnel are convicted by the lower courts, their right to appeal to the higher courts and the long time-consuming process of trial allow them to remain scot free for years. In West Bengal, for instance, three policemen were awarded a sentence of five years rigorous imprisonment by the Calcutta High Court after they were found guilty of murdering an arrested person in the Golabari police station of Howrah on February 26, 1980. More than ten years later the Supreme

Court finally confirmed the conviction (on August 16, 1990).

As always, it is only when the law is taken by the people in their own hands that the guardians of the law wake up. Following the death of the 50-year old Jai Ram Singh in the Patel Nagar police station recently, the people of the locality surrounded the police station, blocked the roads, set fire to vehicles and stoned the police. This compelled the police bosses to rush to the spot and suspend three policemen of the station. Suspension or transfers are hardly adequate as punishment. One of the senior officials indicted for killings during the Meerut communal riots in 1987 was transferred to another spot in UP and now again he figures prominently as an accused in the recent killing of suspected terrorists in a fake encounter in Pilibhit. Departmental actions apparently do not have any deterrent effect on them. Since popular pressures do not lead to punishment by law, will the people have to go further in taking the law in their hands by punishing the criminals in uniform?

EXPORT EARNINGS

Irrelevant Distinctions

A Correspondent writes

ALTHOUGH the budget speech lays great store by efforts to encourage larger inflow of foreign exchanges and announces a number of measures taken in that regard, it overlooks to highlight some changes proposed in the finance bill in dealing with the treatment of export income, quite a few of which at least would appear to go contrary to the objective of encouraging the inflow of foreign exchange.

Under section 80 HHC of the Income Tax Act profits from exports are fully deductible in the computation of a person's income. For this purpose profits from exports are computed according to the formula

$$\text{Profits of total business} \times \frac{\text{Export turnover}}{\text{Total turnover}}$$

According to the memorandum explaining the provisions of the finance bill, the formula is being misused in the sense that non-taxpaying exporters "transfer their export turnover to other business houses merely by endorsement of letter of credit received by them" and that enables such business houses to "get the benefit of 80 HHC without any physical export of goods".

This, to say the least, is a very strange argument. Regardless of whether the purpose (express or implicit) is to promote ex-

port earnings or "to compensate an exporter for the comparative disadvantage faced by him in the international market", as the above-mentioned memorandum puts it, is it anybody's case that a non-tax paying exporter (usually he will be a small businessman) does not require encouragement to export? Why confine an incentive meant to encourage exports only to tax-paying exporters?

Or is it the department's case that the non-manufacturing business house which only 'buys' the export turnover appropriates the whole benefit of 80 HHC and does not share it with the non-tax paying manufacturer of the particular export turnover? Surely, anyone familiar with how market forces operate should know that such benefits cannot easily be appropriated by one party to the exclusion of the others involved. Whether or not the sharing between the parties involved is equitable is a different question. Is the real purpose to see that non tax paying exporters do not derive any benefit from the concessions? Or to ensure that tax paying exporters do not claim a higher benefit than justified by what they genuinely manufacture for export? Whatever be the purpose, do we wish to discourage the exports of the former?

On the one hand the finance minister is crying himself hoarse about the precariousness of the country's foreign exchange position. On the other, he so easily bows to the narrow minded cribbing of his department about the so called 'abuse and 'misuse' of export incentives.

But that is not the end of the story. The finance bill modifies the formula in one more respect, namely, to exclude foreign receipts like interest, commission, etc., from the figure of export profits. Why? Because, according to finance ministry's memorandum, such receipts "do not have an element of turnover". Similarly, while the same bill clarifies that goods will be deemed to be exported when they are transferred to an overseas branch, office, etc., the profits of any such branch or office are sought to be excluded from the "profits of the business" for the purposes of this concession.

The question must squarely be faced whether the country's principal objective is to maximise the inflow of all foreign exchange earnings or just certain types of such earnings, say, earnings through own-manufactured exports of tax-paying business firms, and that too earnings which have a clear "element of turnover" and not by way of brokerage, commission, interest, etc., and not even profits of overseas branches or offices engaged in

the business of exports. If the accent has to be on foreign exchange earnings, as it should be, then this totally misplaced attempt at drawing distinctions between various types of such earnings should stop forthwith.

Even the department's view that sales within India to foreigners, evidently against foreign exchange, do not constitute export for the purposes of this concession needs to be re-examined. Basically, should not the focus be on the realisation of foreign exchange rather than on whether it is through export of goods or services or whether such export is direct or indirect?

CHOI I RA

Fall-Out of New Economic Order?

IF there is one disease which has through history illustrated the intricate and intimate relationship of social, political and economic forces in determining patterns of health and illness in populations, it is cholera. More than a hundred years ago it made its social and political impact on the British empire when the various epidemics, on the one hand, prompted sanitary reforms at home in Britain and rudimentary public health legislations in colonial India and, on the other forced Britain for a time at least to accept maritime regulations. Since then, cholera has been a 'tropical disease' which has been banished from the western hemisphere. It is not surprising that the outbreak of the disease in Peru six months ago, which has already caused over 2,000 deaths and shows little signs of being brought under control, is causing such concern. The epidemic has spread to neighbouring Ecuador and Columbia and there have been outbreaks in Brazil and Chile. According to the head of the Pan American Health Organisation, unless emergency measures are taken on a large scale, it may spread throughout South America and kill over 40,000 people in the next three years. While the concern is justified, the degree of horror is probably similar to the scare that cholera gave to the mighty British empire when it appeared in England and spread to countries considered part of her civilisation—it is too close to home! Moreover, today the outbreak challenges the edifice of modern medicine and its philosophical roots. For after all, according to one version of the history of medicine, the dominant one, diseases such as cholera owe their disappearance to the advent of modern medicine.

And yet the current epidemic, occurring

in the immediate neighbourhood and within reach of hi-tech medicine in the US, is a symptom of the grave social and economic crisis in many Latin American countries. According to several reports, more than half of Peru's population sought emergency food aid last year and its infant mortality rate, the most sensitive indicator of social and economic trauma, is the highest in Latin America. Its heavy foreign debt has had several repercussions—for one, there are hardly any resources available for maintaining existing water and sewage systems, leave alone expanding them, for another, with Peru refusing to make the required repayments in 1985, international aid agencies 'put the squeeze' on the country and aid for public sanitation schemes (as well as for other areas) has dried up. In addition, there is the familiar scenario of third world countries—poverty stricken rural populations migrating to urban areas resulting in high population concentrations with no livelihood, no housing, no amenities who become the targets of diseases like cholera and also its continuing repository. But the most significant point about the Peru outbreak is that it poses the question: is this the beginning of a new phase of epidemic patterns which will affect third world countries under the new economic order?

ARMS CONTROL

False Start?

THE Strategic Arms Reduction Treaty signed by the Soviet Union and the US early this month is the first such agreement proposing a real reduction in long range (intercontinental) nuclear arms. Earlier agreements, such as SALT I and II, have only attempted to limit further increases in arsenals. For this reason, whatever be its limitations and whatever be the eventual form it takes, it is of historical significance. The treaty was first mooted in 1983 but it stayed frozen in the continuing cold war between the two superpowers. It was revived in 1985 and gathered some momentum by 1987 when its finalisation was postponed and the first ever arms reduction treaty of any kind, dealing with intermediate range forces, came into being. If the treaty finally signed this month falls short of expectations, it is a measure of the current balance of power between the two nations. Significantly, while the concessions that the Soviet Union made at the time of the signing of the agreement on intermediate range nuclear forces were seen as being necessary in the pursuit of the larger goal of decreasing superpower tensions, similar concessions today are being criticised as the ignominious surrender of a supplicant

nation.

The treaty was expected to pave the way for a 50 per cent cut in the long range arsenal, but the proposed cut amounts to much less and that too is distributed unevenly. While the Soviet Union will be called upon to destroy or deactivate about 35 per cent of its strategic warheads, cutting its stock from 11,000 to 7,000, the US will end up with only a 25 per cent cut—from 12,000 to 9,000. Ostensibly this is because most of the Soviet warheads are on land-based ballistic missiles which are considered to be most threatening. But in fact this acceptance of deeper cuts is one indication of the Soviet Union's increasingly unequal status *vis-a-vis* the US in these talks. In effect the Soviet Union will have to cut its SS 18 intercontinental ballistic missiles (IC BMs) by half. The treaty also limits the number of strategic nuclear delivery vehicles such as the IC BMs and their launchers and submarine-launched ballistic missiles (SL BMs) and heavy bombers to 1,600 each. All this does not, of course, bring down the nuclear arsenal very substantially. It still leaves the Soviet Union with some 7,000 strategic warheads and the US with about 9,000.

The US has also succeeded in virtually keeping the sea launched cruise missiles (SL CMs) out of the agreement with a limit of 8,880. Since the US has only about 350 of these and the Soviet Union very much less, this upper limit is ridiculous. The Soviet Union's plea to allow the strategic defence initiative project to be subject to some kind of international limit and scrutiny—for instance an expansion of the purview of the anti ballistic missile treaty to cover space launched weapons—has been rejected by the US.

What makes START more of a conclusion than a beginning is the fact that the treaty entirely leaves out of its purview research and modernisation programmes. This means that even while the arms reductions are underway, both countries can go ahead with modernisation which may well make these reductions an academic exercise. These loopholes in the treaty may well become gaping holes in the context of the new situation in the Soviet Union. In fact subsequent to the events in the Soviet Union last week, defence research spokespersons in the US have talked of intensifying research and seeking larger budget grants. There is much scepticism about whether the treaty, which envisages the reductions to be completed in 15 years and is valid for that period will be operationalised even now. One reason for this is that some of the Soviet Union's nuclear arsenal may be located in the Baltic region which may well be out of reach of the central Soviet authority.

TWENTY YEARS AGO

EPW, August 21, 1971

Since the prime minister's appointment of Siddhartha Shankar Ray as union minister in charge of West Bengal affairs, the Calcutta air has been thick with condemnations of "the politics of violence and murder". There is no parallel to these killings in even Calcutta's recent violence-ridden history, for an appropriate parallel one has to hark back to the great Calcutta killings of 1946. Indeed, the systematic way alleged Naxalites and their families were hunted out and butchered smacked of the organised, pre-planned attacks against entire localities which are characteristic of communal riots. Large numbers of youngmen were taken away by the attackers to be tortured and killed at far off places. It was no sudden, quick outburst. The killing is reported to have gone on for 17 hours from the evening of August 12. But the police—neither the local ones nor those imported from other parts of the country in such large numbers—made not the feeblest effort to intervene. What has been the response of the political parties which have been so concerned about the 'politics of violence and murder'? What about the CPI(M)? What is its reaction, as the best organised leftist force in the state, to the cold-blooded killing of, what may have been, well over a hundred professed leftists? Clearly, the CPI(M)'s position is far from unambiguous. For a long time now it has been complaining loudly that Naxalites have been teaming up with the Congress and other parties to murder CPI(M) cadres and supporters. Against this background, it is perhaps not altogether unhappy to see the Congress at the Naxalites' throats. It is, however, ridiculously short sighted for the CPI(M) to take this view of the Cossipore Baranagar murders. The party is mistaken if it sees in the killings a falling out between the Congress and those anti social elements masquerading as 'Naxalites' who have been mainly responsible for the violence against CPI(M) cadres. The young victims of Cossipore Baranagar were so patently unprepared for the murderous assault on them and so ill equipped to meet it that it is clear enough that most of them were not the strong arm type but were rather ideologically oriented Naxalite cadres—or, even more likely, only sympathisers. But in its antipathy to the Naxalites, the CPI(M) has itself refused to make this distinction and has been only too ready to describe attacks on it by patently anti-social elements as the work of 'Naxalites'. So long as it does this, it will continue to play into the hands of the Congress.

Trade Dictates Cotton Prices

D P Sharma

THE rise in cotton and yarn prices has, of late, been the subject of an animated debate reflecting the conflicting interests of the participants in the debate. Reports of discussions the representatives of the industry have had with the textile ministry at various levels indicate widely varying perceptions with each segment offering suggestions for remedial action best suited to subserve its own interest. The official approach to dealing with the complex phenomenon of rise in prices seems to have been influenced less by its own thoughtful assessment of the prevailing market situation than by the alarm signals raised by the decentralised weaving sector highlighting the serious repercussions of the rise in yarn prices on its declining fortunes.

Unquestionably cotton prices have risen very sharply this season: the rise ranging between 75 per cent and 128 per cent depending on the variety. Never before have cotton prices been known to have risen so sharply in any season. Most varieties are now quoted at their all time highs. Cotton yarn prices too have registered sizeable gains and the rise has been particularly pronounced since about the beginning of June (see accompanying price tables).

Manufacturers cannot be expected to take kindly to the rise in the prices of their raw materials as it has the effect of eroding their profit margins. It is therefore scarcely surprising that the organised mill sector should be deeply concerned over the rise in the prices of cotton and the decentralised weaving sector should be greatly exercised over the rise in yarn prices.

The mill industry has blamed the rise in cotton prices on the government's ill conceived policy of allowing liberal exports (totalling 13.43 lakh bales) and the untimely announcement release of export quotas without proper assessment of the supply-demand position characterised by progressive downward revision of crop estimates and increasing mill consumption. Crop estimates were gradually scaled down from 129 lakh bales to 115 lakh bales whereas mill consumption kept above the previous season's level. The figure of consumption for 10 months (September-June) is placed at 91.79 lakh bales against 86.48 lakh bales in the same period last season. Export quotas for cotton were released in disregard of the Cotton Advisory Board's views/recommendations.

Going by CAB's assessment made at its last meeting on June 21, the carryover stock at the end of the season (August 31) is

estimated at around 17.29 lakh bales against the opening stock of 30.79 lakh bales. The crop has been placed at 115 lakh bales, mill consumption at 109 lakh bales, non mill consumption at 7.5 lakh bales and exports at 12 lakh bales. Whether these figures will be revised at CAB's meeting scheduled for August 29 remains to be seen.

The export policy for cotton was no doubt influenced in no small measure by the government's obsessive concern for cotton growers' interests. But seen in the context of the worst ever foreign exchange crisis the government could not be easily faulted for its liberal export policy in an extremely favourable international environment. The quantity of cotton allowed for export alone might not have resulted in the kind of price rise that has occurred if the spread between domestic and international prices had not been as large as it was and if the share of the private trade in the total export quota had been much smaller. The impact of larger institutional purchases for export would have been much less severe.

The export factor apart, the upswing in cotton prices since the beginning of June is attributable largely to the fact that the private trade ruthlessly exploited the shortage of cotton during the lean period as the two major institutions—CCI and Maharashtra State Co-operative Cotton Growers Marketing Federation—had liquidated their entire stocks of cotton. The private trade virtually dictated prices.

The upsurge in cotton prices cannot be satisfactorily explained in terms of reduced availability in the wake of large exports. Thanks to the continuing boom in exports of cloth, yarn, garments, the cotton mill industry has been doing well. Exports of cotton cloth, yarn and garments during 1990-91 aggregated Rs 5,476 crore showing an impressive increase of 33 per cent over the

previous year's figure of Rs 4,108 crore.

While the industry's concern over the rise in cotton prices is natural enough, the hue and cry raised by it need not be taken seriously. Few outside the industry will endorse ICMF vice chairman Kanoria's assessment that the textile mills were facing 'uneconomic working at the current level of cotton prices'. The rising trend in production of cloth as well as yarn is an indication of the strength of demand (domestic and overseas) for its products, the increase in input costs notwithstanding. The *Economic Times* equity price index for cotton textiles could not possibly have registered an impressive rise of 79 per cent from its January low if the industry had not been performing well and the future outlook were as bad as is sought to be made by the ICMF vice chairman.

What is one to make of the industry's complaint about the acute shortage of cotton and its plea for augmenting domestic supply through imports when no mill is known to have evinced any interest in availing of cotton import under the advance licensing scheme? It would not seem unreasonable to presume that mills have been finding it more profitable to encash the premiums of advance licences against exports than to import cotton.

The shortage of cotton at the fag end of the season is not an uncommon phenomenon and this does not have to be viewed with any serious concern. Whether the current supply position warrants imports of

Source: East India Cotton Association

cotton is an issue on which opinion is bound to be sharply divided. The government is reported to have sounded the CCI to assess individual mills' requirements of cotton in order to facilitate arrangements for requisite imports. It is difficult to say how much cotton will be imported. Not much perhaps. Meanwhile the official move to effect imports has had a chastening effect on the market, with prices coming down by Rs 500 to Rs 700 per candy from their peak levels.

Since new crop prospects on current reckoning are considered to be very reassuring—a record crop is widely anticipated—the plea made by SIMA chief Kannan for the “immediate import of 10 lakh bales to tide over the present crisis in cotton supply” deserves to be dismissed as a subtle exercise aimed at highlighting the acute shortage of cotton and its inevitable impact on the supply and prices of yarn. With a view to mitigate the hardships voiced by handloom weavers the government is reported to have drawn up a crash plan according to the highest priority to increasing the availability of yarn, especially hank yarn of counts below 40s.

The National Textile Corporation has been directed to augment production of counts of 20s, 30s and 40s in hank form, if necessary by diverting production to these counts. The corporation has also been asked

to examine the option of temporarily suspending weaving activity of its composite mills to step up production of yarn. The National Handloom Development Corporation has been directed to increase its purchases of hank yarn and to further streamline its supplies to state agencies and handloom weavers. Additional funds are to be allocated to NHDC to undertake this task.

Measures aimed at ameliorating the plight of handloom weavers are welcome. But champions of the handloom weavers' cause need to be reminded that despite a decline of 31 per cent in the official index for cotton yarn prices during the 1989-90 season, the index for handloom cloth had registered a hefty rise of 22.3 per cent. During the same period the index for powerloom cloth rose by 22.9 per cent and that for mill made cotton cloth by 6.2 per cent even as the index for raw cotton prices registered a decline of 91 per cent.

The textile industry which had reaped fortuitous gains following the fall in cotton prices last season can have no legitimate cause to complain about high cotton prices this season, especially when it has been enjoying a boom in exports of cloth, yarn and garments. The industry's representations on the adverse impact of the rise in cotton/yarn prices on its fortunes needs to be viewed with circumspection.

important orders, the most noteworthy being the installation of all imaging equipment in the Manipal group of hospitals.

With its emphasis on R and D, the company introduced several new products with the latest technologies for industrial applications, improving products and manufacturing processes and indigenisation. The company spent Rs 5.8 crore in 1990-91 towards R and D. Some of the products developed using the latest technology are high efficiency motors, new generation contactors, overload relays and X-ray image intensifier I V Systems SIREX ON-1. The company invested a sum of Rs 16.5 crore in modernisation of plant and machinery, new products and infrastructure during the year under review. The new factory at Aurangabad is expected to cost Rs 25 crore.

ASHOK LEYLAND

Thrust on Technology

ASHOK LEYLAND, which accounts for 26 per cent of market share in the medium and heavy duty commercial vehicles sector, recorded an impressive performance during the year ended March 1991. The company's production and sales showed an upswing compared to the previous year. Net sales increased by 34 per cent (on an annualised basis) over the previous 15-month period. The company reduced the expenses to sales ratio from 1.03:1 to 0.97:1 despite sharp increase in the cost of inputs such as raw materials, power and fuel and labour charges. As a result, the operating profits and net profits recorded a hike of 48 per cent and 124 per cent, respectively, during the year under review. The company was able to pay a higher dividend of 27 per cent compared to 25.20 per cent on an annualised basis for the previous period.

Production of medium and heavy duty commercial vehicles registered an increase of 15 per cent on an annualised basis from 27,145 for the previous 15 months to 24,976. Similarly, production of engines was higher by 5 per cent at 4,545 compared to 5,433. Production of ferrous castings increased from 397 tonnes (for 15 months) to 6,389 tonnes in 1990-91. As against the 12.5 per cent increase in demand for medium and heavy duty commercial vehicles in 1990-91, total sales of vehicles, domestic and for export, during 1990-91 was 24,698, an increase of 17 per cent. There was also an increase in sales of industrial/marine engines to 4,517 units. Sales of parts valued at Rs 93 crore was 60 per cent higher than in the previous year.

According to the company, various export strategies initiated with the support of the Hinduja group have resulted in a record export turnover of Rs 40 crore (direct export) as against Rs 20 crore in the previous year. The company exported 1,189 vehicles, including deemed exports, during the year under review. Apart from export of commer-

COMPANIES

Moving into Bigtime Export

SIEMENS witnessed a significant growth in order books, net sales and profits during the year ended March 1991. Orders booked at Rs 438 crore recorded an increase of 8 per cent over the figure of Rs 609 crore for the 18 months ended March 1990. The company received large orders from the Durgapur steel plant and the National Thermal Power Corporation. The net sales of the company registered a growth of 33 per cent (on an annualised basis) over the previous period. Operating profits and net profits improved by 9 per cent and 55 per cent, respectively, during the year. The substantial increase in net profits was mainly due to the impact of lower depreciation provision following the changed Companies Act requirement. The expenses to sales ratio works out lower at 0.98:1 as compared to 1.00:1 in the previous period. Dividend on equity shares was 22.50 per cent as against 20 per cent on annualised basis in the previous period. With the higher order booking, the backlog of orders carried forward was Rs 420 crore as compared to Rs 363 crore in the previous period.

There has been a significant increase in export sales during the year under review. Export earnings of the company, including deemed exports under the IDA scheme, amounted to Rs 59.6 crore as against Rs 61.79 crore in the previous period, showing an increase of 43 per cent annualised

basis over the previous period. The company has emerged as a net foreign exchange earner to the tune of Rs 30.4 crore. During the year under review, orders for electricals and automation for a lignite handling system in Thailand were successfully executed. Similarly, the company also executed an order for installing high tension paper cables in Malaysia worth Rs 4 crore. Software exports touched an all-time high at Rs 5.5 crore. The company also secured a large export order for supply and erection of 33 KV substations for 16 towns from the Bangladesh Power Development Board valued at Rs 28 crore.

To cope with the increasing demand of switchgear the company is setting up a new factory at Aurangabad. Commercial production is expected to commence shortly. It also proposes to undertake the manufacture of miniature circuit-breakers during the current year. The orders for phase II of the modernisation of the Rourkela steel plant valued at Rs 20 crore have been secured. The power generation and distribution division has secured an order from the Maharashtra State Electricity Board for the Urban Gas Power Project of the value Rs 80 crore. This division also bagged an order for HT switchboards with vacuum circuit-breakers valued for Rs 6.4 crore from the NTPC. The medical engineering division executed several

cial vehicles, the company claims to have made significant strides in the export of non-company products such as textiles, leather, etc. Earnings by supply of global tenders amounted to Rs 7.5 crore as against Rs 0.3 crore in the previous year. The company executed a large order worth Rs 8.5 crore for textile export to Iran. According to the directors' report, export orders worth Rs 32 crore covering leather, diesel engines and spare parts are in hand.

The company spent about 0.75 per cent of total turnover towards R and D activities. Specialist vehicles/vehicle options to meet export requirements, a 25-tonne articulated dump truck with exceptional manoeuvrability in slushy conditions and several models of fuel-efficient engines/vehicles have been developed. Productivity increased substantially. The turnover ratio works out higher at 1.22 compared to 1.10 in the previous period. With a view to continuous modernisation and upgradation of products, the company proposes to broaden its product span with an 'intermediate' range of commercial vehicles of 6.16 tonnes GVW. It also plans to introduce new diesel engines with IVECO technology. The company has com-

menced implementation of a comprehensive investment plan for modernisation and augmentation of its manufacturing facilities. The company has received consent for the issue of partly convertible debentures on right basis to resident shareholders and equity shares to non-resident shareholders.

With the takeover of Tube Investment's PMC unit at Ambathur with effect from October 1, 1990, the company is ensured of continuous supply of chassis frames.

The long-term debt-equity ratio works out at 0.75 as compared to 0.70 in the previous year. Funds flow during 1990-91 was Rs 134.18 crore. Borrowings formed 42 per cent of the total sources, trade dues 28 per cent and internal accruals 30 per cent. As much as 45 per cent was utilised for fixed asset formation and 38 per cent was accounted for by receivables and 13 per cent by inventory.

COLOUR-CHEM

Bright Outlook

COLOUR-CHEM, which has a market share of 40 per cent in synthetic resin binder

materials and auxiliaries and of 7 per cent in synthetic organic dyestuffs, pigment dyestuffs and their dispersions, achieved an increase of 19 per cent in net sales in 1990-91. Despite an increase in the cost of raw materials, power and fuel and labour charges, the expenses to sales ratio remained more or less steady at 1.051, operating profits and net profits showed a smart rise of 49 per cent and 76 per cent, respectively, over the previous year.

On the production front, the company witnessed all-round improvement. Production of synthetic organic dyestuffs, pigment dyestuffs and their dispersions recorded an increase from 4,050 tonnes to 4,138 tonnes in the previous year resulting in capacity utilisation of 57 per cent compared to 56 per cent in the previous year. Production of synthetic resin binder materials and auxiliaries improved by 17 per cent from 5,984 tonnes to 6,987 tonnes, showing a higher capacity utilisation of 71 per cent compared to 60 per cent in 1989-90. Intermediates for dyes, pesticides and pharmaceuticals also registered a growth of 15 per cent from 3,354 tonnes to 3,844 tonnes in 1990-91, with capacity utilisation increasing from 61 per cent to 70 per cent.

According to the company, while the sales of organic intermediates and leather chemicals registered improvement, off-take of many groups of dyestuffs remained sub-optimal. Demand from the paints industry was sluggish, resulting in a stagnant market for pigments. The full-fledged marketing division established during the year under review helped to reinforce the market orientation of the company's operations.

Export earnings of the company at Rs 19.77 crore showed a rise of 1.18 per cent over exports of Rs 19.51 crore in the previous year. As against 15.41 foreign exchange earnings of Rs 20.82 crore, foreign exchange outflow was Rs 6.29 crore. Balance net foreign exchange earned. The company will benefit from the provisions of the new trade policy.

The company spent Rs 1.25 crore on R and D during the year, turning 1 per cent of total turnover. Extension of the range of intermediates for dyestuffs and pesticides, new areas of application for a few existing products, cost reduction through energy saving, waste reduction and overall quality upgradation were the major benefits derived from R and D activities.

Funds flow during 1990-91 amounted to Rs 27.93 crore. Borrowings and trade dues were the major sources of funds which were used mainly for financing fixed assets for modernisation and holding inventories. The company incurred capital expenditure to the tune of Rs 11 crore in 1990-91. It had taken up a comprehensive programme for upgradation of technology and modernisation of the Thane and Roha factories, involving a total outlay of Rs 30 crore. The implementation of the programme had to be rescheduled due to resource constraints. The project for modernisation and upgradation of facilities

a) Cost of sales and service (b) results are for 18 months

for the manufacture of diketene is expected to go on stream by this September. The company received the requisite approvals for the manufacture of oil well chemicals with a capacity of 5,000 tonnes per annum at its Roha plant. Production of these items is expected to commence in phases.

The company's sales turnover during the first quarter of 1991-92 has been about 12 per cent higher than in the corresponding quarter of the previous year. The performance would have been better but for industrial relations problems at the Roha works since June. Besides, the restrictive

monetary policy enforced by the RBI has had a dampening effect on sales and inflow of orders. Nevertheless, the discernible improvement in the indigenous demand for many of the company's products augurs well for the performance of the company in 1991-92.

IN THE CAPITAL MARKET

Videocon Appliances

VIDEOCON APPLIANCES is entering the capital market with an issue of 45 lakh 12.5 per cent fully convertible debentures of Rs 200 each. Out of the issue, 18.75 lakh debentures are being offered on rights basis to the existing shareholders of the company and 6.25 lakh debentures are reserved for preferential allotment to shareholders of group companies (4 lakh debentures) and employees, including Indian working directors (2.25 lakh debentures). The balance of 20 lakh debentures are being offered to the Indian public. The public issue will open on September 19 and close on September 28 or earlier, but not earlier than September 24. Each debenture will consist of two parts: part I of Rs 50 and part II of Rs 150. Part I will be converted into one fully paid up equity share of Rs 10 at a premium of Rs 40 on the expiry of six months from the date of allotment of the debentures. Part II will be converted into equity shares at a price to be determined by the Controller of Capital Issues but not exceeding Rs 50 per share, at the end of 20 months from the date of allotment. Videocon Appliances is a member of the Videocon group which is a leading manufacturer of consumer electronics products and home appliances. The Videocon group has a technical collaboration arrangement with Matsushita Electrical Industrial Company, Japan, owners of the well known brand name 'National'. Videocon Appliances is implementing an expansion cum diversification programme to enhance its capacity for washing machines from 2 lakh to 4 lakh per year and to manufacture split and window airconditioners, refrigerators, vacuum cleaners, bread making machines and electric motors. The expansion cum diversification programme is estimated to cost Rs 148.10 crore and is proposed to be financed through the fully convertible debentures (Rs 90 crore), privately placed non-convertible debentures (Rs 34 crore), asset credit scheme of ICICI (Rs 5 crore), foreign exchange loan from ICICI (Rs 3 crore), asset leasing by ICICI (Rs 5 crore) and internal accruals (Rs 11.10 crore). Videocon Appliances has performed well during the

financial year ended March 31, 1991, with sales doubling to Rs 92.33 crore compared to the previous year. The company's net profit was Rs 11.16 crore with an EPS of Rs 14.91. The book value of the company's share was Rs 26.64.

Rajasthan Breweries

RAJASTHAN BREWERIES is making an issue of 166 lakh equity shares of Rs 10 each at par to raise Rs 16.60 crore. Of the total issue, 66.40 lakh shares have been reserved for allotment to the promoters, including 26.60 lakh shares to non-resident Indians on repatriation basis out of the promoters' quota. Of the balance of 99.60 lakh shares, 8.30 lakh shares are reserved for allotment to employees including Indian working directors of the company and of the promoter companies and 39.84 lakh shares have been reserved for allotment to non-resident Indians on repatriation basis. The remaining 51.46 lakh shares are being offered to the Indian public. The issue opens on September 12 for both the Indian public and for NRIs. Rajasthan Breweries is setting up a project to manufacture canned beer, barley malt and malt extract. The brewery unit will have a capacity of 75,000 HL (25 million cans). The licensed capacity for barley malt and malt extract is 35,000 tpa while the plant is being set up for a capacity of 6,000 tpa of barley malt and 1,500 tpa of malt extract. The company has entered into a foreign collaboration agreement for technical know-how with Danbrew, a subsidiary of United Breweries, Copenhagen. Danbrew will help identify, erect and commission the plant, train personnel, start up production and establish an R and D department. Danbrew is to be paid technical know-how fees of 1.76 million DKK in three instalments and royalty at the rate of seven DKK per HL. The agreement is for a period of five years. The project is expected to be commissioned for trial production in January 1992 and commercial production is likely to start by April 1992. The total cost of the project is estimated at Rs 17.60 crore which is to be financed through the equity share issue (Rs 16.60 crore) and equipment

lease finance from BOI Finance and PNB Capital Services (Rs 1 crore).

Modern Threads

MODERN THREADS is raising Rs 3.95 crore through a rights issue of 2,63,550 fully convertible debentures of Rs 150 each at par. The debentures carry annual interest of 14 per cent and are fully convertible on the expiry of six months from the date of allotment. Each debenture is to be converted into 10 equity shares of Rs 10 each at a premium of Rs 5 per share. Modern Threads is setting up a project to manufacture world class dyed yarns in fancy colours exclusively for export to Europe and elsewhere. The project with a capacity of 6,720 spindles to manufacture polyester viscose blended yarn is being executed at a cost of Rs 16.75 crore. The project includes installation of autoconers to produce knotless spliced and electrically cleared yarn as well as computerised colour matching systems to ensure consistency in shades essential for ensuring international quality. The company has finalised a marketing tie-up with Armatex of UK for the entire additional production. Commercial production is scheduled to begin in April 1992. When the impact of this expansion programme is fully realised during the year 1993-94, the company's total exports will reach Rs 17 crore up from the present level of Rs 2.7 crore. The turnover of the company increased to Rs 32 crore during the current year against Rs 28 crore in the previous year. Cash profit for the year increased to Rs 16.1 lakh against Rs 10.3 lakh in the previous year. After providing depreciation of Rs 50 lakh for the year, the balance surplus together with carried forward surplus of Rs 25 lakh of last year have been appropriated by transfer of Rs 75 lakh to general reserve and payment of equity dividend of Rs 38 lakh at 15 per cent, leaving a balance of Rs 24 lakh to be carried forward to next year. After the full implementation of the present expansion programme, the company has projected a sales turnover of Rs 50 crore and gross profits of Rs 4 crore. The rights issue opened for subscription on August 3 and will close on August 31.

Stealth Finance: Thriving on Conflict of Interest

D N Ghosh

Do the startling revelations about the two largest Japanese securities houses revelling in conflict of interest situations hold any lessons for us at a time when we are grappling with the organisation and functioning of the securities market?

THE heads of the two largest Japanese securities houses resigned in the wake of startling revelations that these two firms had shown extraordinary favouritism to big clients and were engaged in dealings with a major crime syndicate. For our country grappling with several issues concerning the organisation and functioning of the securities market, it is worthwhile to ask: does it have any lessons for us?

The major investors and corporate clients were compensated for trading losses totalling nearly \$900 million sustained in the last year's fall in stock prices. No such compensation was offered to small investors who were left in the lurch. It is well known that Japan's financial system has one set of rules for big brokers and rich investors and another for everyone else. For the big investors, the offer of implicit guarantees is a common practice in Japan. Such guarantees are invariably respected for the sake of old relationships.

The question of equity and ethics does not seem to trouble the large security houses. The major shareholders of these houses are big corporations and financial institutions and individual shareholders, constituting a small part, do not seem to weigh much on their conscience. Even though the resignations were an explicit recognition that an impropriety was committed, the facade of remorse did not last long. Soon after the scandal broke, the former president of Nomura, Tabuchi (now vice president of the same securities house) denied at one point at the Nomura shareholders' meeting that there was anything improper about the payments Nomura made to its big clients. The shareholders' meeting, which took place soon after the scandal, was marked by complacency, evidence enough, not unusual, of the fact noted by many perceptive observers that, in the matter of commercial transactions, Japanese society is basically amoral, its strong and conti-

nuing growth has undermined public will ingness to complain.¹

Club arrangements among the brokers, fund managers and big investors are taken for granted. Brokers have floated investment trust funds where big brokers solicit investors with implicit assurance of refunds. Brokerage firms earn a major part of their income from big investors and in the long haul, they cannot in the name of equity and fairness discourage trading practices based on lasting relationships. The big brokerage houses can ill afford to antagonise their big investors for between them they have to regroup for the next operation. Reading between the lines, the Nomura ex chief's observation on the compensatory payments at the shareholders' meeting were highly significant. 'These were inevitable steps taken to avoid unnecessary confusion.'

It is arguable whether the club arrangements could have perpetuated themselves in Japan without a nod and wink from the regulatory authorities.² In fact the ex chief of Nomura spilled the beans in the shareholders' meeting by saying that payments were made "in consultation with government authorities". It is not that the ministry had not been aware of their malpractices. In December 1989 it issued a directive warning brokerage houses not to reimburse clients for investment losses. Seven months later, it punished security companies for compensating clients. But overall, its biting capacity has been ineffective. Its role covers the area handled in the US by the Securities and Exchange Commission, the Federal Reserve Board and the Comptroller of the Currency. But it has less than a quarter of the 8,000 people employed by the US agencies. Had the Japanese type situation taken place in the US, clients would have sued and the firm would have had to contend with unpredictable financial consequences. In some way, it is a tribute to the regulators in the US that the guilty

pleas of Ivan Boesky, Michael Milken, Martin Seagel, Denis Leavine and Drexel Lambert on charges ranging from insider trading to market manipulation were secured and a network of powerful financiers who illegally manipulated markets for their own advantage were exposed and dismantled.

The conflict of interest problem is embedded in any financial market. Its control and management has to become a part of the financial system. Stated simply, a conflict of interest situation arises for a bank or any other financial institution dealing with a client if it has a choice between two solutions for a deal, one of which is preferred for its own interest while the other is better for the client. There may also be situations where a bank or a financial institution carries out activities involving two groups of customers and to strike a balance between the respective interests of the two customer groups becomes a difficult exercise in fairness. If different types of securities business and banking business are combined, such conflicts would inevitably arise. If a security house undertakes the market making function for a security holding and also manages funds under trust business, it has to ensure that its holdings of securities, which may be considered undesirable, are not dumped into funds under its management. Funds under management should not also unduly benefit from the pricing of new issues being undertaken by the securities firm. Securities trading on own account should not benefit in an unfair manner from early information, which the investment research department of the security houses normally releases to the public. Investment advice by investment advisory service of security houses or banks has to be scrupulously given. It has to avoid bias in favour of overtrading of the securities portfolio of its private clients for the sake of generating high fees. Banks also should not lay themselves open to the charge of influencing their securities business done directly or by their subsidiaries, with clients through company information obtained in the course of their lending business. Banks should not unduly encourage private securities purchases through imprudent lending to private customers to finance such purchases. These are illustrative types of cases. The structure of the market and the nature of the regulatory mechanism could create situations of wide diversity arising from separation of commercial banking and securities related activities, such as, underwriting, portfolio management,

Control and management of conflict of interests situations are matters of wide public concern. Market operators with differential access to finance and information could easily exploit situations to their advantage. This is not an argument against liberalisation and positive support for development of competitive conditions, but a plea for simultaneous pursuit of a rational public policy to resolve these inherent conflicts for the sake of efficiency, investor protection and prudential consideration of systemic safety and stability. There are considerable country differences as regards the degree of concern about abuses of conflict of interest situations.⁴ It is not easy to arrive at a solution when, for decades, institutions have been governed by certain business practices and big business houses have entrenched interests in continuing these interests. This is exactly what is happening in India, what comes out in the open is perhaps only the tip of the iceberg. We are still a long way off from introducing certain healthy, efficient and credible standards in the organisation and functioning of the capital and money markets.

It would be simplistic to presume that as the market develops, these ticklish issues would get sorted out or that the development of the market would throw up forces which will help punish the guilty. This would not be so. The Japanese example is a clear pointer that the club arrangement between interested parties can be very strong impediments against reform.⁵ A comprehensive regulatory agency must be in place as soon as the market is unchained and the club arrangements are broken up. Let us not fall into the dangerous self-defeating complacency trap. "Well, these things happen in the developed economies. So what are we bothered about?" It is never too early to set ethical and fair standards in financial transactions. If club networking arrangements are allowed to entrench themselves, we will be moving inexorably towards a corrupt financial world.

Lopsided Growth

Political Economy of Indian Development

by Pradhan H Prasad

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles heel of Indian development plans, the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro-economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

The Retarded Economies

Foreign Domination and Class Relations in India and Other Emerging Nations

by Nirmal Kumar Chandra

Why is it that while the former colonies and semi-colonies have emerged as a major force in world politics over the last four decades, their economies in most cases remain retarded? The first part of this volume focuses on the exchanges between the poor and the rich nation. Did western and private capital and technology really help India, or was it the other way round? Granting that both sides made some gains, did the USSR derive our advantage through its bilateral trade and aid transactions with the third world? Can the theory of unequal exchange explain the growing economic hiatus between the north and the south? The second part of the book is concerned with the domestic scenario in India. The author tries to relate the overall stagnation in material production per capita to the balance of class forces that emerged after independence as a result of a strategy of industrialisation based on import substitution. Long term trends in aggregate and sectoral outputs, the terms of trade between industry and agriculture, real wages and unemployment rates, savings and investment, private monopoly capital, etc. are analysed in this context. Further, the existing laws and regulations on private sector monopolies are also examined from the same perspective. The final essay is a critique of the recent tilt inspired by the IMF and the World Bank towards liberalism in India's economic policies.

Centre-State Budgetary Transfers

Edited by I S Gulati

The papers brought together in this volume examine the federal financial relationship in India as reflected in transactions through the budgets of the Union and State governments. Under the Constitution, the Finance Commission, appointed by the President every five years, is expected to recommend adjustments in inter-federal transfer of budgetary funds to meet the changing requirements of the system. In fact, the transfer of resources from the Centre to the States has taken forms which have fallen largely outside the ambit of the Finance Commission and it is the Planning Commission which has come to play a very major role in the determination of Centre-State financial transfers. The involvement of the Planning Commission has not, however, resulted in a more total view being taken either of financial devolution from the Centre to the States or of inter-state distribution of the amounts so devolved. While transfers under the aegis of the Finance Commission, the so-called statutory transfers, have aimed at covering the non-plan revenue account gaps of the States, the plan transfers coming under the purview of the Planning Commission have sought to plug gaps in the States' resources for financing their plans. The gap-filling approach thus continues to dominate Centre-State financial transfers. If Centre-State financial relations are to be made more equitable and are to have greater regard for efficiency in budgeting, it is argued, existing institutional arrangements will have to be substantially modified. This volume seeks to contribute to raising and debating the relevant questions.

Calcutta Diary

AM

It is August 1991, fifty years since Rabindranath Tagore died and Viswabharati's copyright over his works is to lapse at the end of the calendar year. Anyone, just anyone will now be able to print Tagore and make a commercial proposition out of it. What a calamity to befall Bengali culture. Rabindranath Tagore is to be de-linked from Viswabharati, the Vatican and the Pope will cease to be inseparable categories. But, on such a first rate banal issue, there is some dissonance.

CALCUTTA and West Bengal are having a generally lean time. Thanks to the Cauvery waters, the centre of gravity of the dialectics of centre states relations has shifted away to Bangalore and Madras. Nor does the line of revolutionary insurgency touch West Bengal any more. Half a dozen chief ministers were present at the meeting recently convened by the union home minister to discuss the problem of the Naxalite menace: the chief minister of West Bengal was not amongst them. And in regard to plotters who are contemplating or suspected to be contemplating, to stage a walk out from the union, the list currently includes only Punjab, Kashmir and Assam. West Bengal has turned respectable.

Stodgy, unimaginative times for the Bengalis. But, finally, at least some cause for fresh excitement. This month marked the completion of fifty years since Rabindranath Tagore's death. As in the political sphere, hardly anything of note has been happening of late on the Bengali literary and cultural fronts too. On this point, it is necessary to make a distinction between the Bengalis over here—the Indian Bengalis—and the Bangladeshis. Bengali, the language, is fearfully alive, supple and daily getting to be further enriched across the border, bubbling poetry, intense research on the language's roots and grammar and so on. In contrast, the postman does not even ring once in West Bengal, and it is a wake like atmosphere: the use of Bengali as a medium of communication is thinning out, much of the literary output in Bengali, including of the once widely bragged of poetry, is dull, insipid, stylised. Ditto for Bengali plays staged in Calcutta. The least said of the Bengali prima donnas who, a few decades ago, got themselves accredited as trail-blazers in the cinematic arena, the better. They have failed to get over the fact of their being trail blazers once upon a time, how dare anybody suggest that leave out technical flaws and other species of *faux pas*, neither verbosity nor pomposity can quite pass for creative virtue any longer. But perhaps it is the inexorable

law of economics which is sounding the final death knell for Bengali. Bengali literature as well as Bengali theatre and cinema are victims of a shrinking market. Export prospects are dim: their products will not be let in in Bangladesh. Much like our own love-hate two-way relationship with the west, the Bangladeshis too have a problem vis-à-vis the Indian Bengalis. The emerging middle class over there, the post-partition generations, cannot quite rid themselves of the inferiority complex of yore: they worry a great deal about cultural neo-colonialism. Once Bengali periodicals, Bengali fiction and Bengali cinema from West Bengal are allowed untrammelled entry into Bangladesh, the market for their own creative works, they fear, would shrink. The frustration in West Bengal therefore increases with every day: some fifteen crore of Bengalis across the border present a tantalising picture of an immense potential market for language-based crafts and activities. Bengali after all is the fourth most widely spoken language in the world, taking its place immediately after Spanish, beating the tape with Arabic, yet for the present that market remains a distant, unreachable dream for the export mongers in West Bengal. Only the gullible Indians can be bullied into swallowing hook, line and sinker the bait of market-loveliness. The Japanese and the South Koreans call it *baloney* in private, those belonging to the so-called ASEAN community, to whom the Bangladeshis have firmly attached themselves, have worse epithets in mind. The quantitative restrictions on the entry of merchandise from India will therefore stay.

To resort to the dictum of national self-reliance does not promise too many extra notes of cheer to the mongers of creative arts in West Bengal. Bengali settlements in Bihar, Orissa and Uttar Pradesh have gone the way of all flesh. In large parts of Assam and Tripura, Bengali is now the language of only the *samaśiddhāt*. Within West Bengal itself, despite strenuous patriotic exertions on the part of the state government, let us amend our previous

statement, the aura is both of a wake and of death foretold. Calcutta has now a population nearly three-fifths of whom do not claim Bengali as their first language. Even Bengalis of pure stock are discovering survival in the world's commerce an increasingly dicey proposition, and the mother tongue as somewhat of a hindrance. There was a furore when a few years ago, the state government, falling in line with what had happened long ago everywhere else in the country, decided to have the mother tongue as the only language of instruction at the primary stage in government-run and government-aided schools. Denigrating the mother tongue has since turned into the dearest sporting event for the better-off Bengalis. Now or never, they have made up their mind, their children's future has to be ensured, in the competitive struggle for building a career, Bengali is unwanted garbage: the life-saver is either English or Hindi. The apparel shows the day. As in other parts of the country, girls from sophisticated Bengali households have, in the course of the past couple of decades, crossed over *en masse* to 'shalwar-kameez'. Bengali is ceasing to be the principal language in most such households. What the comfortably placed think today, the rest of the tribe are bound to think tomorrow. In any case, Bengalis are well-known copycats. Even most of the so-called avant-garde plays in Calcutta are lifted straight from Pirandello or Brecht or Ionesco or Pinter or Stoppard: you cannot in fact pick holes with the eclecticism displayed in this shoplifting.

Given this general situation, there are not any thundering waves, culture-wise, Indian Bengalis are capable of creating in the immediate period. Willy nilly, they accordingly retreat to that refuge of last resort, Rabindranath Tagore, to his prose, including his fiction, his music, his poetry, his paintings. Tagore is the left-over pride, he is also, for the Bengalis, the most reliable of all clichés. Righteous indignation bubbled over over a recent minor episode. How dare Sotheby or Christie auction Tagore manuscripts in London without taking prior leave of Calcutta—and Santiniketan? Lightning telephone calls from the state chief minister to our high commissioner in London, importunings with an expatriate commission agent who had apparently already struck a deal with a Japanese party. All is however well that ends well, it is a half-century since Tagore died, it would have been shameful if any of his manuscripts had, in search of the highest bidder, travelled to alien shores.

Now another issue has reared its head around which Bengali parochialism has an opportunity to order general mobilisation.

The Indian Copyright Act, which market-overs in the United States have their own reason to dislike, is currently the cause of some extra heartburning in Calcutta and West Bengal. In terms of the act, which is in general conformity with the international Berne convention, the copyright of an author's works lapses at the end of fifty years from the day of his death. The rights over Tagore's compositions, including his music and paintings, were all now exclusively held by Viswabharati, the apology of a university originally set up by Tagore which has, in the course of the past few decades, slid into the immaturity of the country's only royal family. Funds for running it are arranged under the Central Universities Act, and the funds are plenty. The chancellorship of the university has turned into a sinecure of the Nehru-Gandhis, following Rajiv Gandhi's gory demise, there is serious talk of installing that famous alumnus from Cambridge's correspondence and languages school, Sonia Gandhi, as Viswabharati's new chancellor. Even otherwise, this supposed university has, under the benign tutelage of the union government, gradually been converted into a private fief of a select number whoever the formally appointed vice-chancellor, this small group has continued to rule the roost. One can become a personality of culture in West Bengal by simply being a part of the Viswabharati establishment, much in the manner of any stray wayfarer in New Delhi's Raisina neighbourhood being, by virtue of that very fact, automatically accepted as an important entity of the country's political establishment.

The Viswabharati authorities, who enjoyed total control over the publication rights of, and profits from, Tagore's works, have not exactly covered themselves with glory in the half century since his death. They have been lugubrious, conservative and cantankerous. They had all the opportunity to print and re-print Tagore's poetry and prose and musical compositions by their millions and hereby, apart from minting money, serve an intense social cause. They did nothing of the kind. Publishing was turned into a lazy, rarefied occupation. Important editions were allowed to go out of print. For no apparent reason, the schedule of publications went into disarray. Volumes announced for publication with much fanfare in 1986 on the occasion of the one hundred twenty fifth anniversary of Tagore's birth have, for example, yet to see the light of day. Viswabharati's department of publications, in other words, has made a hash of its role as a monopolist. It has raked little revenue, not because it was lacking in bloody-mindedness, but the artefacts of the marketfriendly approach

remained beyond its ken. To be explicit, it has been plain inefficient. On the other hand, if only played, it could be argued, the classical role of a monopolist by restricting output. Be that as it may, it continues to be run much in the manner of a nineteenth century Bengali landlord's home office. Since the permanent settlement had taken care of the outlandish threat of the sunset law, why bother to strain yourself? The zamindars did not. Nor has Viswabharati. That still does not mean that the insensitivities the quintessential landlord specialised in would not be put on display. Complaints are numerous about the brusque pettifogging way this or that Viswabharati outfit tends to behave even while granting routine rights of reproduction of the facsimile of a Tagore painting or manuscript despite ready offer of paying straightaway the royalty asked for. A couple of decades ago there was that infamous incident when this establishment decided to give the treatment to one who without question is one of the most powerful singers Bengal has produced in this century. Thousands would flock, whatever the season, to listen to his renderings of Tagore songs. Tagore, he established the point, belonged to the people, not to the hoi polloi. That was an unpardonable lapse. Retribution followed. The gentleman was refused permission by the Viswabharati authorities to cut discs of Tagore composition on the pretext that he had indulged in excessive orchestration in his arrangements. The singer had genius, he wanted to liberate Tagore, he wanted to de-monopolise him, that frightened the daylight out of the powers that be. The singer died soon. He had been ailing for some time, it is still a widely held belief that his deep disappointment with the way the tyrants of

Viswabharati presiding over Tagore's estate treated him hastened his death. This coterie is scrupulously invidious in its decisions and judgments. Another exponent of Tagore music, very much a part of the establishment, has rendered quite a few compositions, it was politely pointed out, not strictly according to the original score. So what, he thundered, he is not going to stand any nonsense, his credentials cannot be questioned, where Tagore's songs are concerned, he is the law. The Viswabharati authorities, their monopoly status notwithstanding, or precisely because they had the monopoly, did not make a squeak.

Now, suddenly, occasion for a state wide whining. The Indian Copyright Act has its inexorable ways. It is August 1991, fifty years since Rabindranath Tagore died and Viswabharati's copyright over his works is to lapse at the end of the calendar year. Anyone, just anyone will now be able to print Tagore and make a commercial proposition out of it. What a calamity to betell Bengali culture. Rabindranath Tagore is to be de-linked from Viswabharati, the Vatican and the Pope will cease to be inseparable categories. But on such a first rate banal issue there is some dissonance. Bengali newspapers, otherwise great defenders of the Viswabharati establishment, are in two minds. Their instinctive sympathies are with any version of systematised tyranny. Tears are therefore being duly shed for Viswabharati. It is however also possible to discern a separate gleam in their eye. One or two of them are already earnestly in the publications business, should they succeed in adding the Tagore titles, it could be bonanza of a major proportion, more so because of the international links they have already succeeded in forging.

It is an interesting development. The

TOWARDS INDEPENDENCE 1940 - 1947

Asok Mitra

Asok Mitra travels down memory lane for the benefit of the readers and recounts his days as an Indian member of the Civil Service. The author provides new insight into the infamous Bengal famine of 1943. He documents Britain's tacit encouragement of partition and gives an acute demystification of Mountbatten and Nehru.

pp 168 • Demy 8vo • hb • Rs. 200.00

THE NEW INDIA 1948 - 1955

Asok Mitra

The early years of freedom saw winds of change sweep over the country bringing in its wake fresh challenges and new responsibilities to a member of the Indian Civil Service. The author provides a clear picture of India's relations with the newly formed Pakistan, the Indo Pak border problems, the famous Howrah Riot and its aftermath, the First Five Year Plan and Community Development Projects.

NEW

Bengali monopoly press is failing to come out in full-throated support of the axiomatic proposition that the Indian Copyright Act must be amended exclusively to protect the rights to Tagore's works of a self-seeking coterie, whose only credentials are their unswerving loyalty to the progeny of Allahabad's Anand Bhavan. It is still no reason for the much maligned state government not to bestir

itself. It should come off its high horse and do the needful at this juncture. That is the least expected of it so the world could be convinced that, whatever the rumour, this government is not one hundred per cent anti-Gorbachev. Tagore must not be nationalised, he must not be plebeianised, he must remain a private monopoly. Down with the Indian Copyright Act.

CIVIL LIBERTIES

Soviet Union, Human Rights and Amnesty

A G Noorani

The Soviet Union's new attitude to the human rights situation in the country is not only welcome, but an example to be emulated by other countries as well

THOSE of us in India who find Amnesty International a squalid nuisance and whose response to its reports on this country is akin to the rage of a Alban would do well to draw the lesson from the changed Soviet attitude to amnesty. But, of course, *this* is not the Soviet Union we like. The three days between August 19, the day of the coup, and August 22, the day it collapsed so ignominiously, exposed to the whole world that the Soviet Union we really love is the one we were used to in the past—authoritarian, locked in a cold war, with a veto in hand to bail us out of the mess in which our follies in Kashmir land us.

But now Soviet Union is a most fascinating country. Sample this from an article by Sergei Volovets in *Moscow News* of June 16, 1991 (no 24 of 1991) entitled 'Amnesty International Human Rights in the USSR'. He writes:

Amnesty International celebrated its 30th anniversary late last May. It has been treated on a par with NATO, the CIA and the Pentagon here in the past. At a time when Soviet civil rights activists were sent to prison camps, and the most prominent of them to the city of Gorky or across the ocean, Amnesty tried to defend them like all the other prisoners of conscience throughout the world, and sometimes it succeeded.

After attacking the oppressions in Vilnius, South Ossetia and Karabakh, he remarked:

In this sense organisations like Amnesty International are indispensable. Human rights must be protected everywhere, including our country, at an international level. Amnesty has representatives in 160 countries (about 200 persons in the USSR). The campaigns carried out by Amnesty in defence of individuals, groups or peoples have been effective so far. In the West its moral prestige is exceedingly high and governments have to heed its opinion.

Considering the extent of the problems the civil rights movement in the USSR is in a pitiful state now. What happened to the so-called Burlatsk / commission which was set up with the authorities' blessing, when it seemed that Gorbachev was serious about continuing the reforms? Who in Russia demands the release of the leaders of national democratic movements in Central Asia—arrested and condemned as common criminals?

It is precisely Amnesty that has a vital role to play immediately in defending our citizens without waiting till the civil rights movement revives in the Republics and the Union. True, one hears it said again that the democrats' contacts with the West are not disinterested; that those who contribute to Western mass media are essentially traitors (witness the statement made by KGB General Iconov at a meeting of the Soyuz group of deputies). But this merely confirms the pressing need for a civil rights movement in the USSR.

There was an article on Amnesty a year earlier in *New Times* in its issue no 21 of 1990 by Lev Yelin. It was entitled, 'Amnesty International in the USSR'. Its sub-title was long and proud: 'More than 100 Soviet citizens have joined this human rights organisation *once* unpopular with our authorities'. But it *still* remains unpopular with our 'babus' who can teach the Bourbons lessons in mindless obstinacy. Lev Yelin wrote:

Amnesty International is working for the release of prisoners of conscience, for an early and fair trial of all political prisoners, for the abolition of capital punishment against tortures.

Soviet law enforcement agencies have long been opposed to Amnesty International. Until 1988, books and articles about its 'links' with the CIA poured forth in a steady flow, but in March 1989 the first Amnesty delegation visited Moscow where its section had ceased to exist in the mid 1970s, almost as soon as it appeared after its members had been arrested. Ian Martin, its Secretary General, called on our editorial offices and

granted us an interview. Last April he paid us a second visit in connection with the Progress Publishers having brought out the Amnesty International's report, 'When the State Kills: The Death Penalty versus human rights'. The report includes a chapter about the USSR. The leadership of Amnesty International plans to send to us its representatives soon so as to discuss setting up a national section here.

Ian Martin a regular reader of *New Times*, visited our offices again recently. One of the subjects of our conversation was why the Soviet press, which had clamoured for the abolition of capital punishment in the early years of the perestroika period, no longer did so now. Is it improper to call for humaneness against the background of growing crime and social instability?

Yelin mentioned that he had found from Amnesty's information bulletins, its monthly newsletter presumably, that Amnesty had adopted 50 prisoners of conscience in the Soviet Union. Half of them were conscientious objections. Eight had been locked up in psychiatric clinics.

There has been a most impressive flow of writings on human rights in the Soviet Union in the last two years particularly *New Times*, issue no 4 of 1989, published an article entitled, 'International Control? Can Soviet People Appeal to International Organisations in Case Their Rights Are Infringed Upon?'. It was based on Lev Yelin's interview with Temuraz Ramishvili, member of the UN Sub-Commission on Prevention of Discrimination and Protection of Minorities. It ended with a quote from foreign minister Eduard Shevardnadze's speech to the 43rd session of the UN General Assembly, "international control in the domain of human rights is the imperative of our time". When will an Indian foreign minister use such language?

On July 27, 1989 *Sovetskaya Kultura* carried an article by T. Menshikova on the right to know. Oleg Iyomushkin writing in *New Times* (no 42 of 1989) on the absence of the writ of habeas corpus in the USSR squarely posed the question: "Why do we have period of detention that would make the Guinness Book of Records?" What have our CPI and CPM friends to say about preventive detention in the Soviet Union which is far worse than what we have in India which is bad enough. It deserves condemnation and they are right in condemning it. But why, why is our Left silent on violations of civil rights in the USSR?

Finally, there was a very interesting article entitled 'Justice without Politics' by Yuri Feofanov in *New Times* (no 18 of 1990). He pleaded that it would make sense to dispense with political departments and party organisations in Soviet law-enforcement agencies. But, he asked, will that make our courts really independent? It is an able plea for depoliticisation of justice.

Elections and Democratic Process in India

Sarah Joseph
Gurpreet Mahajan

The notion of vote banks is crucial to the strategy of most parties as also of election analyses but it is difficult to gauge how successful it has actually been. The recent election, for instance, challenged such assumptions

ACCORDING to the received wisdom of liberal democratic theory, elections constitute an important element in the democratic process. They enable citizens to intervene directly in the political process, select their rulers and express their policy preferences. Elections thus legitimise the power exercised by governments and make governments representative. No political system it is held, can be truly democratic unless it holds periodic and free elections.

Although this view of elections forms part of the political theory and rhetoric of our political system, there is another different view of elections which has also gained currency among political elites and even social scientists, and is being widely disseminated through the media today. This is an instrumentalist, elitist view of elections according to which elections are merely an arena in which periodically political elites struggle for power. This struggle is viewed as a no holds barred, ruthless competition among political groups in which manifestos and promises are seen as no more than mobilising strategies and in which the voter is merely accepted as an intelligent partner in the political process. True voters still have the option in most cases of expressing their preferences through their votes but the experience of the past has shown that the voter, faced with limited choices, may opt for a candidate or party because it seems to be the lesser evil even though its performance when in office in the past has been poor. This has encouraged political parties to try and mobilise voters on a number of short term issues rather than placing more fundamental issues and choices before them.

This view of elections is not restricted to politicians. Studies of elections also reflect, to a large extent, this instrumental view of elections. Elections have been studied in two main ways. One is the traditional 'election study' conducted by social

scientists and the other are the poll predictions made by psephologists. Although these form distinct modes of study, there is also similarity between them. A number of election studies have been made by social scientists in India since independence. In the main, these have studied the voting population of different constituencies and regions in terms of their socio-economic characteristics—caste, community, income and the like—and have tried to relate the voting behaviour of citizens to these variables. Limited generalisations about the political behaviour of different citizen sectors have been made on the basis of such data.

The development of psephology as a specialised mode of election analysis has added a high degree of precision and predictive certainty to the whole enterprise. Psephologists give the highest priority to accurate prediction of the outcome of elections. Using available data reinforced by opinion polls and sample surveys they extrapolate statistical predictions about the possible distribution of votes in a particular region. The notion of a swing of votes towards or against a major party like the Congress has been used as a tool with which to calculate the number of seats that may be gained or lost. Such calculations, accompanied by an analysis of index of opposition unity (IOU), have in the past had a reasonable degree of success thus adding to the glamour and prestige of psephology.

Election analyses and poll predictions capture the interest of the public at election times but they also provide an input into the decision-making of political parties. Analyses of voting trends have always been used by parties to evaluate the success or failure of their election strategies and to help evolve further strategies. The Congress style of accommodative politics was the logical corollary of such calculations in the past. But what used to be done by rule of thumb methods in the past is

now being done in a more detailed and precise manner with the help of computerised information. Thus the political calculations and strategies of parties and the election analyses of social scientists and psephologists feed on each other to reinforce a particular view of elections. They have of late, been supported by the press which conducts its own election studies, albeit in a more rough and ready manner.

A presupposition of election studies and psephology is that elections constitute a discrete narrative with a beginning and an end—the installation of the newly elected government—and at the most, an election may be compared to previous ones. But for the purpose of analysis, elections form an autonomous event. This naturally limits the scope of the generalisations which may be made. Election studies and poll predictions have contributed little to our understanding of the long term trends which may operate in the political system. In any case, the picture they give us is of a system in which different groups and categories are available for mobilisation in terms of their collective interests. Neither the origin of such groups nor the changes which may be taking place in each of them can be understood through such studies. However, it is assumed that group affiliations, particularly caste and community affiliations, can be used to mobilise support for a party or a candidate.

This is, of course, the basis of the belief that there are vote banks which can be tapped. The notion of vote banks has undergone some changes over the years. In the first few elections, the Congress relied on what were called power brokers to mobilise votes for the party. These were often rural elites who could use the socio-economic dependence of lower castes and the rural poor to generate votes. The strategy was used with considerable success by the Congress in rural Bengal for instance, as also in other areas. But changes in the rural power structure brought about by land reforms and other measures, as well as politicisation of voters, has limited the scope of such strategies. Power brokers now might have to use violence and intimidation to ensure votes. The more recent notion of a vote bank is of mobilisation along caste and community lines by political leaders. The assumption is that there is a collective identity which can be mobilised for votes through promises and concessions. Political leaders then negotiate with community leaders as well as make other

The notion of vote banks is crucial to the strategy of most parties as also of election analyses but it is difficult to gauge how successful these strategies have been. The recent elections, for instance, challenged many assumptions about vote banks. Neither OBC vote, nor the Muslim or Hindu vote fulfilled the expectations of different parties. However, the notion of caste/community vote banks is apparently so deeply entrenched that no falsification is possible by counter instances. Reluctant to give up this notion, analysts have explained counter instances as 'splits' in the vote banks. For instance, before the recent elections assumptions about backward class and Hindu vote banks were made and political parties evolved strategies to tap them. When these strategies did not entirely succeed they did not give up the assumptions but merely sought for additional factors which might have influenced outcomes. Thus it was said that the backward castes voted as Hindus in some areas under the spell of the 'Ram rath'. In others the Hindu vote was said to have been split by Mandal. Little attempt was made to explore the extent to which the voting choices of people are actually determined by such attributed identities.

One is not denying the existence of social and ethnic identities and loyalties but merely questioning the notion of vote banks which assumes a determinate relationship between an identity and voting preferences. People have multiple identities. They may be simultaneously members of a caste, religious community or occupational or gender based group. As a member of such putative groups their interests may at some level coincide with those of an ideal prototype Hindu OBC / woman/rural poor. Notionally a person could be a member of each of these vote banks. However, which of these identities comes to the foreground depends upon a host of factors. Also, there may be contradictions internal to an identity or clashes between identities. Political parties are continuously trying to identify groups which may be mobilised for political support and to do this they may have to construct new identities by redrawing the boundaries of existing ones. But the success of this enterprise depends in the last instance upon the perceptions of agents in this case upon individuals perceiving themselves as a part of that group and then acting in accordance with that perception.

It is not difficult to understand why political parties have relied so heavily upon the notion of vote banks. In the absence of strong grass roots organisation, a record of continuous work among voters

and success in fulfilling election promises, vote bank strategies appear to be a softer option. It appears easier to woo voters through promises and concessions, or by playing on their fears and insecurities. Populism becomes then the inevitable consequence of this kind of politics.

It is a pity that social scientists also have worked with the notion of vote banks. Some recent studies of Indian politics have noted that development has only increased the political salience of categories like caste, community and region. They have therefore tried to adopt a social or cultural approach which accepts caste, community and other such primordial identities as permanent realities of the Indian scene. What needs to be explored, in their view, is the changing hierarchies of dominance in society and the relationship between dominance and state power. Contemporary analyses of elections by social scientists and political analysts share these assumptions and build upon them.

Election studies conducted by social scientists have generally adopted the techniques and assumptions of behavioural social science. Explicitly non evaluative, basing themselves on empirical data gleaned from surveys using questionnaires, they analyse the voting behaviour of the population. The early studies of the 1960s and 70s were made within the framework of modernisation theories. They implicitly tried to test such hypotheses as what kind of changes modern democratic institutions and development were bringing into traditional societies and to what extent primordial loyalties had been eroded or displaced by new loyalties in a modernising polity like India. More explicitly they recorded the political awareness and involvement of different groups and examined the extent to which participation in the political process was influenced by factors such as caste, religion, literacy, occupation, etc. Looking back on those studies it is striking how little they contributed towards any wider understanding of Indian politics.¹ For some years the verdict was self congratulatory: a traditional society sustaining democratic processes which would hopefully, over time, bring about peaceful social change. Election studies hardly reflected the mounting pressures which were to erupt in the political system.

Unlike the election studies conducted by social scientists, psephology has more limited aims, although it also claims to be value neutral, scientific and exact. Arguing that it is possible to develop measures of electoral change and to relate votes cast with seats won, it concerns itself primarily with predicting electoral trends.

However, even though it sets out to analyse the 'what' rather than the 'how' of elections, psephology has also addressed a wider range of questions. In India, psephologists have used census data to generate a profile of each constituency in order to draw conclusions about the voting propensity of different groups. Measuring the 'volatility' or 'stability of voting support' for a party in different constituencies, they have tried to identify the social groups that support different parties in a given constituency. There is thus a certain continuity of interest with the earlier election studies. However, in the absence of a clear notion of the political system psephologists tend to select a random group of categories and indices by which to classify voters and voting trends. Very often they merely test popular hypotheses. For instance, in the last elections perceptions regarding the effects of Mandal and 'mandir' were tested. One generalisation put forward was that in UP even the OBCs voted for the 'mandir'. The Muslims however did not resort to tactical voting but stayed with the Janata Dal. In Madhya Pradesh the 'sympathy wave' introduced a new factor and almost all the constituencies that went to the poll in June voted Congress. And so on.

The statistical generalisations put forward by psephologists do not of course offer explanations. One might for instance learn that the Ram char that swept UP was stemmed in MP but by itself it does not constitute an explanation. Thus such generalisation should not be read as a mandate for a party on a particular issue. We need also to remind ourselves that there may be other factors which influence choices. Hence one should be extremely cautious about deriving any generalisations or explanations from a statement of correlations and trends. The lack of explanatory power is a well known problem with such empirical modes of analysis.

It has been noted that there is often a dichotomy between the issues and compulsions of elections and the policies of a government when in power. An example of this phenomenon is provided by the way in which the present government is pushing through changes of far reaching importance with the minimum of debate even though such measures were hardly discussed during the elections. Parties like the Congress or BJP which had included liberalisation in their manifestos preferred to mobilise votes on issues like the 'Ram mandir', or stability or Rajiv Gandhi's assassination. The limited scope of election analyses both reflects as well as supports this elite notion of government. This possibly accounts for the cynicism and apathy with which voters

greeted the recent elections. Few parties campaigned on important issues facing the country and few voters believed that participation in elections would help them select a government actually committed to their needs and anxious to stand by its electoral promises. The violence and corruption generated during the elections only added to the general apathy

A controversial recent restatement of democratic theory by thinkers like Schumpeter and Dahl has held that the primary purpose of elections is to enable elites to compete for office rather than to encourage active participation by the masses in politics. The actual conduct of government and choice of policies should be left to elites who would be responsible to the electorate. A similar notion seems to support both the attitude of political parties towards elections as well as election analyses. Elections are seen as a process by which popular support for parties is elicited and recorded. Hence parties are resorting more and more to marketing techniques, selecting issues likely to carry the widest appeal, projecting 'images'. Few view them as occasions for raising basic issues and concern.

A side effect of this attitude towards elections is that increasingly people are resorting to direct intervention in the political process through violence or mass mobilisation. The last decade has seen mobilisation on an unprecedented scale on issue like ecology, tribal rights, agricultural prices. However the actual success of the mass movements has been modest. Movements representing powerful groups like kisans may win concessions sooner or later since they form a powerful lobby within political parties as well. But the rural poor organised around issues like ecology, resettlement are not always perceived as a potential vote bank in spite of their impressive capacity for mobilisation. Hence the issues they raise are not always put high on the political agenda by parties or governments.

One of the correctives which has been suggested for this state of affairs is democratic reorganisation of political parties or inner party democracy. This, it is hoped, would help them perform more efficiently their role of articulating popular demands. While inner party democracy would probably challenge the dominance of social elites within political parties and generate a new kind of leadership and style of functioning, it is doubtful whether, by itself, it would make a major change in the political system. Political parties themselves tend to view democratisation mainly as a means of more effectively disseminating party programmes and building up a grassroots support base for the party. It is not evident that par-

ties like the BJP which claim to have a democratic style of functioning are any more responsive to people's needs and aspirations than other parties.

In the recent discourse on politics in India, two models of development are being sharply contrasted—the Nehruvian socialist model and the market-oriented model being implemented today. The Nehruvian model of development was part of a package which included parliamentary democracy and self-sufficiency for the country. It envisaged a wide role for the state in both production and distribution while also reserving an important space for market forces. But it was soon discovered that it would not be possible to ensure egalitarian distribution without a strong political movement to sustain it. This was discussed in many a five year plan and other official documents. Some progress was certainly made but both equity and faster growth became victims to an extent of accommodative politics. The market model differs from the earlier one in that it has given up the goal of self-sufficiency and envisages a much narrower role for the state. The state would be needed to provide infrastructural facilities in certain key areas of distribution. For the rest market forces should be given free play for greater productivity and efficiency. And while the Nehruvian model was committed to democracy, the market model is not necessarily so. Agencies like the World Bank would gauge the prospects and advantages of democracy for a country like India through statistical correlations between various indices guided by the overriding priority of goals like stability and growth. Apparently they do not make possible any firm conclusions.

Despite these differences the notion of democracy which informs both of these models is an instrumental, elitist one. We have argued that political practice based upon such a notion of democracy has contributed towards discrediting the political system and even the concept of democracy. A different view of democracy which reasserts the values of popular participation and accountability could help to restore some credibility to political processes. In a more participatory model elections would be seen as one among many democratic processes, sustained by other processes and with a significance which extends beyond the selection of a government. And only in that framework the identity of the voter as citizen who weighs the performance of governments might come to acquire some importance.

Sri. SP. SABAPATHY

Bank of Madura Ltd.

Regd Office 33, North Chitral Street, MADURAI 625 001
Central Office 758, Anna Salai, MADRAS 600 002

**Excerpts from the speech of Sri.SP. Sabapathy,
Chairman, Bank of Madura Ltd. at the 48th Annual
General Meeting held at Madurai on 12.8.91.**

Bank's Performance

The progress that the Bank has achieved during 1991 has been such that new milestones have been passed in key areas. Despite the deceleration in the rate of growth of deposits of the banking system, our Bank could cross the landmark of Rs 400 crores. The non-resident deposits increased by 31%. Gross credit crossed the landmark of Rs 200 crores and stood at Rs 222 crores registering an increase of 16.2% over the previous year's level. The Bank has fulfilled the norm of 40% in respect of advances to priority sector prescribed by the Reserve Bank.

The working of the Bank has yielded net profit of Rs 200 lakhs as compared to Rs 143 lakhs in 1989-90. This was made possible by optimum utilisation of funds. I am happy to report that we are one of the very few Banks in the country to charge full depreciation on Government securities and even after absorbing depreciation, the Bank improved the return on Government and approved securities to 10.9%. The ratio of idle assets to demand and time liability is kept at a low level. The performance of the Bank in this area is recognised as one of the best in the banking industry.

Ours is the only private sector bank in Tamilnadu privileged to have been authorised by the External Affairs Ministry to sell passport application forms through selected branches.

Dividend

I am glad to report that Reserve Bank of India have approved payment of 16 per cent for the year ended March 31, 1991 as against 14 per cent declared during the previous year. The rights shares are eligible for dividend for 6 months.

Outlook for 1991-92

For the current year we have planned to reach the landmark of Rs 500 crores deposits. To achieve this objective certain potential branches have been identified to be placed on the fast track. We propose to enter into Credit Card business through a tie up arrangement with Canara Bank. We plan to introduce computerisation in 12 more branches in 1991-92. Application has been submitted to the

Reserve Bank of India for licences for opening new branches in 41 centres during the current plan period.

Issue of further shares

It is gratifying to note that the 1990 Rights Issue for Rs 5000 lakhs was made a success thanks to your overwhelming response. As a result, the paid up capital has improved to Rs 14990 lakhs. In line with the increase of Banks deposits, the Directors are of the view that the ratio of net owned funds to deposits should be increased. For enabling further issue of shares, the authorised capital is proposed to be enhanced to Rs 300 lakhs. In the agenda for this meeting there is an item seeking approval of the shareholders for authorising the Board of Directors to issue additional shares for Rs 75 lakhs as Rights Issue during November 1991. I request all the shareholders to give consent for this issue and record favourably.

Budgetary proposals and the Banks

The withdrawal of the ceiling on interest rate on debenture could affect the banks both way, through loss of deposits and good advances. Blue chip companies would rather go to the capital market and raise funds than come to the commercial banks for borrowing at a higher rate.

Although the budget proposals had freed the funds market, the banking industry has not witnessed any major relaxations whatsoever. The combined impact of the interest tax, the unsustainable level of CRR and SLR requirements and low interest bearing securities mean high cost and lower earnings for banks.

Besides an additional administrative burden of a great dimension has been proposed to be imposed on Banks which are supposed to deduct tax at source from those customers who earn more than Rs 2500/- per year in interest income. I am of the firm opinion that this would substantially add to operational costs of the banks. I sincerely hope that the Narasimham Committee recently appointed by the Government will look into all the problems faced by the banks and address itself to the proper reorganisation of the banking institutions to make them more efficient and productive.

Non-performing advances

As all of you are aware, the incidence of non-performing advances though in varying degrees has been the bane of the banking industry. The problem of realising sticky advances through normal legal process is becoming more and more difficult. Suits for recovery of advances take as much as 5 to 6 years to get a decree. After getting the decree the execution is also delayed for a number of

reasons beyond the control of the banks. The dues to Government, State and Central including Income Tax dues are recovered as arrears of Land Revenue in an expeditious manner. As the banks make advances from the savings of the community as a whole, there is a strong case for dues to the banks to be treated on par as dues to Government. We have represented the matter to the Reserve Bank of India to devise urgent measures to solve this problem.

Privatisation of Banks

Private Sector Banks are rendering commendable services to the customers as also to the community at large. We seek support from the Government for maintaining their accounts with us and for eliminating discrimination meted out to us. Now a lot of discussion is taking place about privatisation of public sector banks and this leads us to believe that there would not be any further nationalisation. This is a welcome move which will create healthy competition amongst all banks.

Sick Units

The way to cure industrial sickness cannot be at the expense of banks. Banks do not have inexhaustible funds and both banks and borrower should know this. The Governor of the Reserve Bank of India, Mr Venkitaraman has rightly said that banks should work profitably keeping in view the twin criteria of becoming consumer friendly and reacting to change. If a bank sustains losses it ultimately becomes the responsibility of the Government even though money may belong to the depositor.

Undue and unwarranted concessions and reliefs and further pumping in of additional funds by banks to sick units of questionable viability or being directed by BIFR is certainly not a healthy sign and will definitely make even the lending banks go sick in some cases.

Issue of Bonus Shares

It is high time the well run private sector banks with sound financial position such as ours should be allowed to issue bonus shares. After all the dividend pay outs have been regulated by the Reserve Bank of India and if for one have always felt that shareholders in a commercial bank are not adequately compensated. At a recent meeting with the executives of the Reserve Bank of India I reiterated my standpoint and requested them to bestow thought to this subject.

ARIES/BA/91

Price Rise Gathering Momentum

The impact of the devaluation of the rupee and the budget proposals has been marked on the pace of price rise.

THE wholesale price index recorded a growth of 6.1 per cent during the first 18 weeks of 1991-92 on a point-to-point basis as compared to 5.3 per cent last year. However, if one measures the rise on an average basis, it was notably higher at 11 per cent as against 9.1 per cent in the comparable period of 1990-91.

The wholesale price index was 191.8 on March 30, 1991 and was moving up at a steady pace during the first 13 weeks of 1991-92 ending June 29 to reach 196.4. However, after the devaluation of the

rupee the uptrend in prices gathered momentum and in the next three weeks the increase was 1.2 per cent. The announcement of the budget proposals on July 24 gave a further impetus and in the next two weeks the price index rose by 2.3 per cent.

The increase of 6.1 per cent in the wholesale price index during the year up to August 3 was brought about by a 9.3 per cent rise in primary articles (11.7 per cent in 1990-91), 4.5 per cent rise in manufactured products (3.5 per cent in

1990-91) and 4.3 per cent rise in fuel, power, light and lubricants (1.3 per cent in 1990-91). The respective increases in 1988-89 were 6.2 per cent, 6.5 per cent and 0.5 per cent (Table 1).

The price rise of 5.8 per cent in 1989-90 up to August 5, 1989 was thus largely due to a spurt in the price of manufactured products. This trend underwent a sharp change in 1990-91. There were steep increases in the prices of products under different primary commodity groups. This pattern was repeated in the first four months of 1991-92.

The price of consumer articles (weight 37 per cent) spurted by 9.7 per cent compared to 8.8 per cent last year. The increase in prices of edible oils can be attributed to a shortfall in domestic production and inability of the government to import large quantities of oils due to scarcity of foreign exchange. Prices of other food articles seemed to have risen on account of the increase in transport costs.

The commodity groups that seem to have been affected by the devaluation and the increase in oil prices include electrical and non-electrical machinery, transport equipment and parts, cement, basic inorganic chemicals and organic chemicals, etc. Table 2 presents the trends in these items.

In the retail market the prices of all these items were ruling high. The rate of increase in most commodities has been in the range of 5 to 15 per cent. The consumer price index for industrial workers had spurted up by 4 per cent in the first quarter of 1991-92 up to June 1991 (the latest data available) as compared with 4.5 per cent in 1990-91.

TABLE 1. MOVEMENTS IN WHOLESALE PRICE INDEX

Kashmir and India

DN

For the pan-Indian bourgeoisie it is as a captive market for its manufactures that Kashmir is important and not as an area of investment. That is the reason why customs barriers between Kashmir and the rest of India were lifted while restrictions on non-Kashmiri ownership of property in Kashmir were left untouched.

SARDAR PATEL, recently decorated with a posthumous Bharat Ratna, it would seem, was not so keen to have Kashmir in India. According to M J Akbar's *Kashmir. Behind the Vale*, (Viking, New Delhi, 1991) that was because of the Kashmir valley's overwhelming Muslim population. "Patel felt it would be far better for the ninety-six per cent Muslim Kashmir Valley to go to Pakistan" (p 102).

Nehru, on the other hand, was clear that Kashmir should go to India, not because, as some Kashmiris allege, he wanted to preserve access to the fabled spring waters of Chashmeshahi, or because of his "commitment to secularism", as M J Akbar would have us believe, but for more prosaic reasons. Nehru wrote in 1948 to Attlee: "Security of Kashmir... is vital to the security of India especially since part of the southern boundary of Kashmir and India are common. Helping Kashmir, therefore, is an obligation of national interest to India" [Akbar, p 121].

Nehru was not the first person to argue in these terms. Early this century, the British colonial ideologue and viceroy, Curzon, had argued in similar terms, when he enunciated the imperial strategic doctrine for the British Indian empire: "India is like a fortress, with its vast moat of the sea on two of her faces and with mountains for her walls on the remainder, but beyond these walls, which are sometimes of by no means insuperable height, and admit of being easily penetrated, extends a glacis of varying breadth and dimension. We do not want to occupy it, but we also cannot afford to see it occupied by our foes. We are quite content to let it remain in the hands of our allies and friends, but if rivals creep up to it and lodge themselves right under our walls, we are compelled to intervene because a danger would thereby grow up which might one day menace our security... He would be a short-sighted commander who merely manned his ramparts in India and did not look beyond" [Neville Maxwell, *India's China War*, Jaico, Bombay, 1970, p 21].

Notions of strategy and security are as much class notions as any other. There are no simple, straightforward 'geo-political

compulsions' which would dictate that Kashmir must be part of India. The compulsions of the Indian state, of the pan-Indian big bourgeoisie are those which they have taken over from colonial British India, as can be seen by comparing Nehru's statement with that of Curzon. They are not the compulsions of those who would build a more democratic order, founded, among other things, on the ending of all forms of national oppression.

Further though couched in terms of security this is not a question of security. The real question is that of expansion—security is a way of justifying that expansion in terms that appeal to national sentiments. What is at stake is not a genuine security interest, but the interest of being able to exploit markets and being able to dispose of labour surpluses. It is the pan-Indian big bourgeoisie whose interest is chiefly involved in holding on to the Kashmir market and using its surplus. But, as we will see later, other sections of the bourgeoisie, including sections of the middle bourgeoisie and even aspirants to the bourgeoisie, are also interested in holding on to Kashmir.

There is a widespread notion that Delhi does not gain anything from Kashmir, and that, on the contrary, Kashmir is pampered and subsidised by Delhi. As is common with all the Special Category Hill States (which also includes Himachal Pradesh and the north-eastern states) Jammu and Kashmir does receive a high per capita 'assistance' from Delhi. But, in the case of J and K alone, this central assistance is 70 per cent loan and 30 per cent grant, as against 90 per cent grant and 10 per cent loan for the other states. [Arshad Maqsood, 'New Delhi and Kashmir: Integration or Alienation?' in *The Kashmir Dossier*, February 1991]. Consequently, the more the 'assistance' from Delhi the worse J and K's financial position becomes. "In fact, the bulk of the annually increasing budget deficits is accounted for by the burden of interest payments to the Central Government. Out of the current year's projected deficit of about Rs 370 crore, almost Rs 300 crore were interest payments" [Maqsood, p 10].

Further, J and K government expenditure, even more than those of other states, is determined by 'security'

considerations—Delhi's attempt to crush the movement for independence currently going on in the valley and its military confrontation with Pakistan and China. One of the major expenditures over the years in Kashmir has been that on the highway linking Jammu and Srinagar, a highway built and maintained at great cost. The highway was built initially for military reasons, to enable the Indian armed forces to sustain a substantial presence in the Kashmir valley. But, as in the case of the railways the British built after the 1857 uprisings, the means of communication have commercial as well as military uses—the same highway is also the avenue for selling manufactures and other commodities in Kashmir, and for taking Kashmir's timber and other primary products out. The irony is that Kashmir pays twice for the expenses incurred in keeping it subjugated—the funds not only come partly out of its own budget, but they also entail continued interest payments to Delhi.

Financial payments are, however, only a small part of the matter. More important are the commercial trade benefits that accrue to the pan-Indian big bourgeoisie. Customs barriers existed between Kashmir and the rest of India until the arrest of Sheikh Abdullah. It was only after his arrest, with the puppet government of Bakshi Ghulam Mohammed in place, that the customs barriers were lifted [Akbar, p 158]. With free trade imposed on Kashmir, trade then developed in the classic colonial manner—manufactures from the metropolis exchanged for raw materials and other primary products from the colony.

Kashmir has been providing an increasing amount of timber and other primary products, including fruits. Kashmir's two main natural resources are forests and water. There has been extensive deforestation, with timber being supplied to the Indian railways. "Apart from the widespread adverse ecological impact, a high value resource was sold at virtually a throwaway price which not only did not bring any substantial monetary benefits in terms of current revenues but also eroded the potential for future income and the State's capacity for self reliance" [Maqsood, p 11].

Further crushing any attempt at self-reliance, the central government has moved to take full control of Kashmir's water resources. There is a combination of low potential utilisation (out of the estimated 10,000 mW potential, only some 1,000 mW of generation potential has been created) with important projects being under the control of Delhi. Even the commissioning of the Salal project did not result in any lessening of the power shortage in the Kashmir valley, because the transmission lines had not been

upgraded. So that, while in the midst of winter Srinagar was without power for three days in the week, power from Salal was being supplied to the northern grid, to meet the needs of Delhi most likely "Naturally the question came to be asked whether this was a case of faulty planning or deliberate negligence" [Maqsood, p 11]

Step by step, all the key power projects in the state were taken over by the National Hydel Power Corporation (NHPC). Again, it is during periods of central rule, or when puppet governments were in place, like the one of G M Shah, that the decisions to hand over various projects to the central organisations were taken. The 400 kV transmission line was handed over to NHPC during the period of G M Shah, while Jagmohan's two spells of governor's rule were very beneficial in extending Delhi's control—the Sawalkot and Baghlihar projects on the Chenab were handed over to NHPC during his first spell in 1986, and in 1990 the 200 kV line project was handed over to NHPC. As Arshad Maqsood points out, "NHPC will control not only the generation but also the distribution system, particularly in the Valley, the implications of which can well be imagined" (p 11).

Other exports from Kashmir are those of fruits, mainly apples, and handicrafts, mainly carpets and shawls. The trade in apples is controlled at Delhi's Azadpur mandi by Punjabi khatri traders. The auction in this market is clandestine, lending itself well to price fixing by the traders. Knowledgeable observers estimate that the growers in the valley get only about 20 per cent of the auction price.

In handicrafts and shawls, the trading situation is different from that in fruits. In these fields the traders too are Kashmiris, including those at the retail end in non carpet handicrafts. The traditional Kashmiri 'kharkanedars' are traders from the carpet and shawl trades. The master weavers are attached to particular 'kharkanedars'. A substantial Kashmiri bourgeoisie (substantial not in size, but in numbers) has grown up in carpet, shawl and other handicraft manufactures. These, of course, are handicraft and not factory manufactures, which are conspicuously absent in Kashmir.

Investment in Kashmir by Delhi and the pan Indian bourgeoisie has been basically in two fields—roads and communications for military purposes, both to suppress the independence movement in the valley and in order to confront Pakistan and China, and commercial purposes, and in power generation and transmission, so as to better exploit Kashmir's natural resources of water and forests. Capital investment for industry has been virtually non-existent. The pan Indian bourgeoisie and Delhi have invested virtually nothing in the field of industry. There are two

measly government sector factories—assembly units of the HMT and ITI, with investments of Rs 5 crore and Rs 50 lakh respectively. Wages in Kashmir are quite high—something like Rs 50 a day for unskilled labour in Srinagar. So, wages are not such as would specially attract the big capitalists to put up plants there.

Overall, Kashmir is important as a market for Indian manufactures, and not as an area for the investment of the Indian big bourgeoisie's capital. Other than rice, most items of mass consumption are imported. Kashmir's imports are about four times its exports (*Draft Annual Plan for Jammu and Kashmir, 1990-91*, New Delhi). The excess of imports over exports has to be made up through payments from other income—from tourism, which was estimated by Tata Economic Consultancy Services to account for one third of state income in 1983 and from its earnings in handicrafts and agriculture.

For the pan Indian bourgeoisie it is as a captive market for its manufactures that Kashmir is important and not as an area of investment. That is the reason why, soon after the dismissal of Sheikh Abdullah, customs barriers were lifted between Kashmir and the rest of India while restrictions on non-Kashmiri ownership of property in Kashmir were left in place. Of course, there has been a steady whittling down of these restrictions and whenever necessary the expedient of 90 year leases has been resorted to. Various central government organisations have been given such long leases, as also big capitalists like Oberoi's. Medium scale capitalists, like those who ran many hotels

in Srinagar, however, have had to buy short leases from Kashmiri owners. These middle capitalists are the ones who have most resented the restrictions on their buying of property in Srinagar—as they have had to pay a rent to the Kashmiri owners of property, resulting in a reduction of their profits. Potential middle-level investors from the plains of Aryavarta also see the Kashmir restrictions on property ownership as a curb on their fundamental freedom to move anywhere in Delhi's domains in search of profit and avenues of accumulation.

The differences in the Kashmir policy of the party of the pan Indian bourgeoisie, the Congress, and the BJP, with its large support among middle-level traders and aspiring capitalists, reflect differences between the big and middle capitalists on this score. For the pan-Indian bourgeoisie it is now sufficient that Kashmir remain a captive market for its manufactures, so it does not press for an abolition of restrictions on private Indian investment in Kashmir. For the middle and newly developed aspiring bourgeoisies in the plains particularly in the Hindi heartland unable to break through in areas dominated by the pan Indian bourgeoisie, and facing competition from the growing Muslim and backward caste middle classes, the abolition of all restrictions on their investment in Kashmir has become an urgent matter in the political agenda. That is one of the reasons why the BJP's programme, based on the assertion of Hindutva and the ending of Article 370 in Kashmir, has now got a wider response in the Hindi heartland.

Drug Industry: Crying Wolf Again

Arun Bal

In the last couple of months the drug industry has been putting enormous pressure on the government to review the Drug Price Control Order and all the later decisions on prices. Is its stand justified?

FEW people are perhaps aware that the drug policy which is directly related to the health of millions of consumers is formulated not by the health ministry, but by the ministry of fertilisers and chemicals. The lists of essential drugs available to date have also been formulated by the ministry of fertilisers and chemicals. Last year, for the first time the health ministry came out with a list of essential drugs. This first small step towards correcting the fundamental flaw in our health policy also a first step towards loosening the stranglehold of the industry over the policy, did not go unnoticed by the industry although the ostensible reason for its reactions since then has been the 'unremunerative' prices of drugs. Clearly the industry is trying to create a fear psychosis by issuing subtle threats—earlier, that it would stop producing essential drugs unless the profit margin is hiked and now, the strike call.

The industry's main arguments supporting its actions are (1) unremunerative prices of final products, (2) no control over prices of raw materials, (3) uncertain environment for business, and (4) lack of automatic price hikes. Let us examine these one by one. Over the last 20 years the industry has always harped on the lack of adequate profits. It has always demanded total decontrol of the market to improve the profitability of drugs. Are drug companies incurring loss due to production of essential drugs? A recent analysis of the financial results of last seven years of top 30 companies reveals that in spite of fixed prices of finished products and increasing prices of raw materials, none of the accepted financial parameters of profitability of these companies has suffered a set back. The companies reluctantly agree now that they are in general doing well. However, they argue that this is not so much due to any particular concessions to this industry but due to the healthy economic environment of the past two years. They want increases in MAPE now to offset future losses they predict they will suffer next year! The price of Terramycin is another example. Prior to the DPCO the price of Terramycin in the retail market was Rs 14.00. After the DPCO it was reduced to Rs 3.50. In fact it is still the

same. Hence it is safe to assume that even at Rs 3.50 the companies are getting adequate profits. Another analysis of the pricing structure done by a pharmaceutical manufacturer in the co-operative sector has revealed that even at 75 per cent MAPE the companies are making 15 per cent profit quite comfortably.

In fact, it is high time that the industry clearly states its definition of 'reasonable profit'. The industry has always kept it ambiguous to suit itself. However a 15 per cent profit margin should be adequate by any standards. The industry is making this profit on essential drugs even at present. For example paracetamol is priced higher than the accepted cost. Locost Standard Therapeutics, a pharmaceutical manufacturer in the co-operative sector has shown many times that this very essential drug can be marketed at much lower prices than at the present price, which is 17 paise per tablet.

The industry has always been reluctant to produce bulk drugs. So its non-compliance in producing bulk drugs is nothing new. In fact seven major bulk drugs have always been produced by the small scale sector. The larger companies have always been more interested in the formulation market, which generates greater profits.

A popular argument with the industry is that the Indian drug prices are lower than anywhere in the world. The table shows that this is incorrect. A public campaign by the drug industry some time back included a comparative analysis between the drug prices of different countries in south east Asia. However, drug prices of Bangladesh have been conveniently left out.

The industry has always disclaimed any responsibility for the proliferation of irrational drugs with an ingenuous argument that after all it is the government which licenses the drugs for manufacture and the industry only produces them! The chairman of Lyka has been attributed this argument in the campaign. It would be pertinent to note here that the same Lyka had vociferously protested against the ban on the hazardous, irrational combination of chloramphenicol and streptomycin (Lykasirep). Also Lyka in collusion with the drug controller's office has managed

to obtain a stay order from the Bombay High Court on the ban and has subsequently withdrawn the drug from the market. After a commercial boycott by consumer organisations, Lyka objected to government orders on the ground that it be allowed to sell the stock in 'pipeline' though it admitted the drug was harmful. In other words the government is greatly influenced by the opinion of the industry in matters of issuing licences. And even when it does ban a drug industry promptly obstructs it.

The industry's argument of unhealthy environment is specious. The atmosphere is being labelled as 'unhealthy' because the government has insisted as per its stated policy that the industry should repay the money which it has collected unethically from the pockets of millions of poor consumers. In spite of the unequivocal decision of the Supreme Court in favour of the government, the industry is reluctant to repay the amount.

The per capita expenditure on drugs in India has been termed as lowest in the world. A survey done by a consumer organisation has shown that 13 per cent of a family budget is spent on drugs and that too, on irrational drugs. This takes away vital financial resources of the family which could be used for food and other necessities. How ethical is it to compare the price of a cup of tea with a tablet of essential drugs?

The total annual drug production in India is approximately Rs 3,500 crore. This vast amount of drugs are accessible to only 20-30 per cent of the population. Fifty-five per cent of the drugs produced are either irrational or hazardous. Drug production was expected to reach the mark of Rs 16,000 crore a year at the end of Eighth Five Year Plan. It is claimed by the industry and the government that this is necessary to achieve the goal of 'Health for All by 2000 AD'. The present emphasis and thrust of the policy is on 'what drugs can be produced?' and not on 'what drugs need to be produced?'. The pattern of drug productions does not match the disease pattern of our country. If only

TABLE I

| Drugs | Prices in India (Per kg) | International Prices (Per kg) |
|----------------|--------------------------|-------------------------------|
| Doxycycline | 5.690 | 1.337 |

| Furosemide | 1.426 | 450 |
| Ceftriaxime | 35.670 | 3.500 |
| Vitamin (B 12) | 494 | 132 |
| Ampicillin | 1.392 | 743 |

Source: A Decade after Hathi Committee, KSSP 1989

essential and rational drugs are allowed to be produced in the country in generic form then the present quantity of drugs produced would quite adequately fulfil the needs of all consumers

It is necessary to reiterate that consumers realise that the pharmaceutical industry is a vital sector of our economy and any fluctuation in general economic parameters is likely to affect this industry also. There should not be two opinions about the necessity to protect the industry from adverse effects of generalised price escalations. However, the pharmaceutical industry is different from other sectors in a few aspects. Its products directly affect the health of the millions of poor consumers. Unlike other consumer products consumers of drugs have no say in the matter. The government issues licences the industry produces drugs and the doctor prescribes the drugs which the consumer has to buy at the quoted price—and suffer adverse effects, even death! The situation warrants that there should be in-built checks in the system to protect the consumer.

Will there be a shortage of drugs if industry goes ahead with its plans to stop production of drugs and diversifies into other areas? Will the consumer be adversely affected? There may be a temporary shortage of drugs. However, the consumer needs to be assured that this is totally controllable. The public sector can produce most essential drugs in enough quantities. A recent study has revealed that the 'actions' and 'inactions' of the policy makers have systematically sabotaged TDPL and other public sector units. It would be necessary to probe this further to assess the benefit which have accrued to the private sector due to these actions and 'inactions' of the policy makers.

The industry has successfully perpetuated and nurtured a 'drug culture' in our country with help from the medical profession. Industry perceives any reasonable measure to limit its profit in the interest of society as a threat to its very existence. The unfortunate complacency and apathy of the medical profession has aggravated the situation. The industry has never faced the question whether consumer of drugs gets 'value for money' as in the case of other consumer items. It is necessary to organise end users and real consumers of the system to start questioning the industry. This should be a positive first step to dismantling the prevalent 'drug culture'. Rationality of the drugs produced should be linked with profitability. 'Health for All by 2000 AD' can be effectively achieved only if the consumer is made a focal point of a national drug policy.

Sexual Harassment as Sex Discrimination

D Nagasaila

Although sexual harassment at the workplace is widespread, Indian laws, criminal and labour, offer little protection to women. In the US, two recent judgments have ruled that such harassment amounts to sexual discrimination.

SEXUAL harassment at the workplace is often considered as one of the 'occupational hazards' that every working woman has to face. Despite the large numbers of women in the Indian workforce and the widespread nature of the problem, no serious attempt has been made towards effectively tackling it. Today, the only legal remedy available to a harassed woman is to give a police complaint and initiate criminal proceedings, perhaps civil cases for damages. The degree of proof required in all these proceedings is high and it is rather an uphill task to prove such issues in the courts. Apart from lengthy procedures and complicated rules of evidence, both criminal and civil remedies can be resorted to only after the act or the offence has actually been committed, and does not offer a remedy to prevent such sexual harassment in the future. Moreover, such proceedings are also outside the purview of service and labour jurisprudence.

In India sexual harassment has been viewed only in the limited sphere of criminal law and has not been included as part of the labour laws. While labour legislations include provisions to deal with discrimination on the basis of sex in matters of employment, sexual harassment is not so included. Thus we have safeguards against sexual harassment in criminal law and safeguards against sex discrimination in matters of employment such as recruitment, pay, promotion and so on in labour law, each operating independently of the other offering a real solution to sexual harassment of women at the workplace.

It is in this context that a recent judgment of the court of appeals of the United States in *Ellison vs Brady* (1991) is of relevance to us. In this case the court ruled that sexual harassment amounts to sexual discrimination. Kerry Ellison was hired as a revenue agent by the Internal Revenue Service (IRS). A male co-worker started bothering Ellison at work, asked her unnecessary questions and loitered near her desk. He also started writing love letters to her while she was attending her training course in another part of the country.

Ellison complained to her supervisor and by the time she returned the following month, her co-worker had been warned

to leave Ellison alone. He had also agreed to transfer to a different office. But after the transfer he had second thoughts and sought a re-transfer to his former office. The employer agreed to his request, provided he delayed his return for six months. Ellison objected to her employer agreeing to the co-worker's request to return and requested a transfer herself. She then filed a complaint charging her employer with sexual harassment.

The appellate court agreed with her. Title VII of the Civil Rights Act of 1964 prohibits employers from, among other things, discriminating against an individual "with respect to his (or her) compensation, terms, conditions or privileges of employment, because of such individuals' sex". In 1986, the US Supreme Court held, in *Meritor Savings Bank vs Vinson*, that this prohibition applies to situations in which sexual harassment creates a "hostile or abusive work environment". In applying this Supreme Court ruling to Ellison's case the appellate court said that the offensive conduct must be examined from the perspective of the female victim and not from the perspective of an average person. The court noted that as a result of experiences peculiar to members of their sex "many women share common concerns which men do not necessarily share" such as fear that sexual harassment may lead to violent sexual assault. The court also stated that "if we only examine whether a reasonable person would engage in allegedly harassing conduct, we would run the risk of reinforcing the prevailing level of discrimination. Harassers would continue to harass merely because a particular discriminatory practice was common". The court concluded that the act of the employer amounted to sex discrimination because a woman of average sensitivities or in other words 'reasonable woman', would find the co-worker's conduct so severe and pervasive that it would alter the condition of employment and create an abusive work environment.

On the question of remedy, the court held that the employer should act in a manner reasonably calculated to end the harassment. Here again the test to ex-

amine the remedial action should be from the perspective of a 'reasonable woman'. The court again emphasised that "asking what a reasonable employer would do runs the risk of reinforcing any prevailing level of discrimination by employers and fails to focus directly on the best way to eliminate sexual harassment from the workplace".

In *Robinson vs Jacksonville Shipyards* a federal district court case, a female worker claimed that pictures of nude women in sexually suggestive or submissive poses in the workplace and sexually demeaning comments and jokes of her male co-workers and supervisors, created a hostile environment. The district court agreed and held that "the cumulative, corrosive effect of this work environment over time affects the psychological well being of a reasonable woman placed in these conditions".

These decisions of the US courts are interesting and of great relevance to the Indian context. There are basically three important points which need to be highlighted here. Firstly the ruling that sexual harassment at workplace amounts to sexual discrimination. Secondly, the yardstick for measuring sexual harassment is that of a 'reasonable woman' and not that of a 'reasonable man' and not even a 'reasonable person'. Thirdly, the remedial action should be calculated to end the harassment and the same is to be again viewed from the perspective of a 'reasonable woman'.

In India we do not lack legislations protecting women's rights. In fact, Article 14 of the constitution guarantees equality before the law and equal protection of the laws. Apart from this equality clause stated in general terms, the constitution has article 15 which prohibits discrimination on grounds of sex among other things. Interestingly, the incorporation of the equality clause met with no opposition in the constituent assembly unlike in the US where the Bill of Equal Rights has met with repeated resistance and has not been passed till date.

In furtherance of Articles 14 and 15, the Equal Remuneration Act was enacted in 1976. The description of the act is—

"An act to provide for the payment of equal remuneration to men and women workers and for the prevention of discrimination on ground of sex against women in the matter of employment and for matters connected therewith or incidental thereto". A reading of the objectives of the act makes it clear that the scope of the act is rather wide guarding against discrimination not only in employment but for matters connected therewith. Despite the constitutional guarantees and parliamentary enactment these provisions have been

RHIZIC G C S

seldom put to use to obtain relief in matters of sexual harassment.

As far as legislations on equality of sexes go, India is far ahead of the US. However in the US though equality of the sexes is not a fundamental right, the courts through judicial interpretation have recognised the rights of women not to be subjected to sexual harassment in the workplace. Such an interpretation is possible even with existing Indian laws on the subject. It may be worthwhile for the women's movement and the legal fraternity to think in terms of such wider principles and expand the rights of women to guard against sexual harassment. This is a relatively unexplored area of labour jurisprudence and can be used as a

strategic and effective tool to tackle sexual harassment of women at their workplace. However, expecting the Indian judiciary to take such initiatives may be futile. Not so long ago a senior woman IAS officer complained of sexual harassment by a senior IPS officer in Punjab. She sought to take criminal action against him because no departmental action was taken. The courts however dismissed her case as being too 'trivial' an issue! If this is the plight of a senior IAS officer that of the women in the lower echelons of employment can well be imagined.

In view of this should the legislature step in and include a 'sexual harassment free' clause among the working conditions assured to every individual?

Road to 'Raktakshetram'

Report from Chunduru

M Shatrugna

This is not the first time that dalits have been assaulted in Andhra Pradesh. But the Chunduru massacre stands apart, for, what sparked it off was such an inconsequential incident.

CHUNDURU is a small village with a population of about 8,000, 12 km from Tenali on the Vijayawada Madras section of the South Central Railway. The road connecting it from Tenali town is uneven and untarred over a major part. This is a Reddy Telaga majority village in a Kamma belt with a Reddy population of about 3,500 and a sizeable number of Telagas—it has about 2,000 SCs. Valiveru and Manchala are the adjoining villages where the Reddys dominate in all spheres. The village has a police station, a small hospital with a male doctor and a high school. It has electricity supply and there are quite a few public taps, with bore well water available in the 'maalapalli' or the 'harijanwada'. A 20-ft road separates the upper caste portion of the village from the harijanwada with the statues of Mahatma Gandhi and Ambedkar. With a temple and a church, it has all the trappings of a prosperous coastal Andhra village. Guntur district has a large Christian community with Tenali town having a substantial population of 12,000 Christians.

The village has a typical agrarian structure as found anywhere else in Andhra with the upper castes holding most of the land with the difference that in Chunduru about 550 SC families are tenant cultivators. With the conversion of a number of SCs to Christianity and the attendant benefits of education and primary health care, the church has had a great influence on the economic uplift, however tardy, of

the downtrodden. By the end of 19th century, Harijans who basically were agricultural labourers had started moving up the social and economic ladder with better education and accumulation of small amounts of money to become tenant cultivators. Today a tenant as part of the lease agreement pays in advance per year a sum ranging from Rs 3,000 to Rs 3,500 per acre to the landlord proprietor. A large number of SCs are also agricultural labourers. The literacy rate is also relatively high among the SCs. All these factors appear to have had a bearing on the recent incidents in the village.

On July 4, Govathoti Ravi, an SC undergraduate student went to see the film *Alajadi* (Agitation) at the local 'Srinivasa' theatre. He was holding a 'chair' class ticket. A close relative of the sarpanch, Kurru Srinivasa Reddy had also gone to see the film. As the film began, Srinivasa Reddy suddenly felt somebody's foot touching his back. He turned back and found that the 'culprit' was Ravi. Realising the mistake, Ravi apologised profusely. But enraged at the audacity of a 'maala' occupying a 'chair' class seat and that too in an 'impolite posture' Reddy thrashed Ravi in the theatre and left the scene. Not satisfied with the 'punishment' meted out Ravi's father Govathoti Bhaskar Rao, a teacher, was summoned the next day and given a good thrashing with the demand that the absconding Ravi should be summoned to 'explain' his misbehaviour. After

two days Ravi had arrived from Ongole. The Reddy youth who had kept a vigil at the railway station accosted the terrified Ravi, brought him to the village, gave him another thrashing and left. Fellow Harijans advised Bhaskar Rao to lodge a complaint with the local police station, but he refused to do so as he felt that it was too trifling a matter to pursue further. But having come to know that the Harijans could even think of lodging a police complaint against the leaders, the Reddys decided to teach the 'erring' Harijans a lesson. Part of the 'lesson' was the social boycott of the entire Harijan community. The reprisals included denial of work to Harijans in the fields, importing labour from outside, prohibiting barbers, potters, etc, from selling their services to the Harijans. In short, a social and economic war was declared on the hapless community.

The Harijans were forced to find work at far-off places. But the Reddy community was in no mood to 'tolerate' the 'arrogance' of the dalits. After a lot of discussion and meticulous planning, the upper caste people with the connivance of the local police carried out this gruesome massacre of the Harijans on August 6. Two police officers, C I Saibaba and D S P Rayilayya who were posted with additional police pickets in the village had manipulated the administration in such a way that SI Srinivasa Rao, a conscientious officer was kept away from the scene and they together master-minded the attacks.

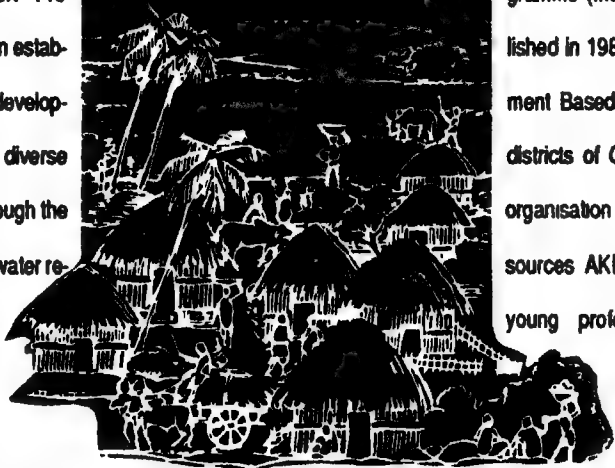

According to the villagers around 11 am on August 6, the police under a SI and some constables created panic in the 'maalapalli' by claiming that their lives were in danger from the Reddys and asked the dalits to leave their houses for safety. As all the dalit men in the village fled they found the Reddys and other upper caste people blocking their passage armed with deadly weapons. When they ran towards the railway track, they found another set of 500 upper caste people waiting there armed with spears, swords and other lethal weapons. What followed was a systematic and brutal assault of the Harijans. The fleeing dalit men were caught, maimed and butchered on the spot. While those caught near the railway track were speared and their bodies pushed into gunny bags and thrown into the nearby Tungabhadra canal, others were chased into the fields, caught and hacked to death. The post-mortem reports of the recovered bodies record multiple stab injuries. With hands, legs and head chopped off, the doctors attending the dead had a difficult time identifying the bodies. The holocaust went on till 3 pm. According to eyewitness accounts and Katti Padma Rao, president of the Dalit Mahasabha about 21 men were

THE AGA KHAN RURAL SUPPORT PROGRAMME

(INDIA)

IS LOOKING FOR A CHIEF EXECUTIVE

The Aga Khan Support Programme is a non-profit organisation established in 1983 to promote participative approaches to rural development. Based in Ahmedabad, the programme is active in three diverse districts of Gujarat, working to improve rural livelihoods through the organisation of people and better management of land and water resources. AKRSP (I) has a staff of 80 young professionals, an annual budget of about Rs.3.5 crores and significant potential for further growth.

Reporting to the Board of Directors, the Chief Executive will give overall direction to the programme and will be responsible for its management, including programmes, staffing and budgets. He/she will succeed Shri Anil Shah, the retiring Chief Executive who has successfully led the programme since its inception. The Chief Executive must have a professional qualification, preferably in the agricultural or social sciences or management and extensive experience at senior levels in managing rural development. He/she must be able to deal effectively with senior officials in government, donor agencies and other NGOs in India and abroad. As head of an innovative programme with scope for experimentation, the Chief Executive must be committed to rural development, able to lead and inspire programme staff creatively in policy development, planning and implementation and prepared to monitor and evaluate programme performance professionally. Salary and a range of benefits will be attractive and fully commensurate with qualifications and experience. Knowledge of Gujarati and an ability to speak and willingness to learn Gujarati would be a distinct advantage.

Applications or nominations should be addressed to Mr Nasser Munjee, Chairman of the Personnel Committee of AKRSP (I) at: Housing Development Finance Corporation, Ramon House, 169, Backbay Reclamation, Bombay 400 020.

ULKA-4453

missing. By Saturday, August 10, eight dead bodies were recovered from the nearby fields and the Tungabhadra canal. The dead included Jaladi Mattaiah (50), Mandru Ramesh (24), Jaladi Emmanuel (40), Mallela Subba Rao (30), Devarapalli Jaya Rao (25), Jaladi Essack (29), Sankuru Samson (25), Angalakuduri Raja Mohan (17), Ravi Chandra Kumar (29), a doctor working in the Guntur General Hospital, who had observed the post-mortems of the dead from close quarters was so shocked that he committed suicide by hanging himself with a rope on August 9, unable to bear the grief.

Following the Tuesday massacre, the families of the victims and other dalits fled to Tenali, sought asylum in the Salvation Army Church in Tenali at Itanagar, a predominantly Christian area. But the most disgraceful aspect of the whole episode is that till Wednesday evening (August 7), full 24 hours after the massacre the district administration in Guntur was not informed of the incidents. Only on late Thursday did the state government depute a number of ministers and officials to visit the village to express their 'sorrow'. The chief minister visited the village only on August 10 and announced compensations including an ex-gratia of Rs 1 lakh for the family of the deceased, one acre of land and the usual 'long-term' measures like a school, housing, etc, which by now have become a ritual. But the dalits wanted the arrest and prosecution of the criminals as a precondition for the acceptance of any government-sponsored compensation. They also demanded the prosecution of the local police officers who had abetted the crime. Though both the police officers have been placed under suspension and a judicial probe ordered, the full list of the killers is yet to be made public nor have criminal proceedings commenced.

On August 10, all the eight bodies were buried in the centre of the village on government land at the periphery of the upper caste habitation. Named as 'Rakthakshetram' (land of blood) a 21-ft martyr's column is to be raised on the site. Uptil August 20 no serious effort has been made to arrest the culprits. Lack of 'eyewitnesses' appears to have hampered the police investigation.

Meanwhile the Dalit Mahasabha under the leadership of Katti Padma Rao has furnished a list of about 40 who appear to have participated in the Chundurur carnage. The list included M Sambu Reddy, Tippireddy Srinivasulu Reddy, Tippireddy Krishna Reddy, G Brahma Reddy, Gorripati Prasada Reddy, Tippireddy Narayana Reddy, Tippireddy Rami Reddy, China Lakshma Reddy, Gorripati Peda Brahma Reddy, Basana Sitaramaiah, Poorthi Soorayya, Osana Edukondalu,

Peda Venkat Rao, Peda Subba Rao, Vasana Pitchaiah, Vasana Prasad, Vasana Nageswar Rao, Ambati Narsimha Rao, Ambati Prasad, Ekkurti Poornachander Rao, Annamreddy Srinivas, Kurthi Sivaiah, Vasana Koteswara Rao, Yellamanda, Vasana Venkatesh, Seedipudi Koti Reddy, Chepudi Subbi Reddy, Chepudi Venkata Reddy, Vuyyuri Satyanarayana, Gorripati Punna Reddy, Seedupudi Punna Reddy and his seven sons, Vuyyuri Pedavenkat Reddy, Emani Koti Reddy, Sedipudi Ramachandraiah. All of them belong to the village of Chundurur, Modukuru and Manchala. While the

police claim that many arrests have been made in connection with the August 6 incidents it is not clear whether the police list covers the list given out by the dalit organisations as well.

The Chundurur incident is not the first time that the dalits have been massacred by the upper caste. A major assault on the dalits had taken place in the late 60s in Kanchikacherla during the chief minister-ship of Kasu Brahmananda Reddy. Then Karamchedu, Padiri Kuppam and Neerukonda followed during the TDP regime. But the Chundurur massacre stands apart in sheer brutality.

NATIONAL INSTITUTE OF ADULT EDUCATION

(An autonomous institution under Govt. of India)

Invites applications for five posts of Research Associate

Scale of Pay: Category A: Rs.1800 (consolidated) per month for first two years and Rs.2100/- (consolidated) per month for the remaining three years.

Category B: Rs.2200-100-2700 for first two years and Rs 2700-100-3200 for remaining three years.

Job requirement: The Research Associate will be expected to participate in providing academic and technical resource support in the implementation of adult education programme among others in the area of (a) Human Resource Development; (b) Learning and Curriculum; (c) Media and Communication; (d) Research and Evaluation; (e) Comparative Studies; (f) Foundations of Adult Education; (g) Management and Planning, and (h) Documentation.

Educational Qualifications:

Category A: Uniformly good academic record with at least 55% marks at Master's level and aptitude/commitment for work in adult education.

Category B: Uniformly good academic record with at least 55% marks at Master's level with Ph.D. degree in adult education or allied subjects or with at least 3 years whole-time work in adult education or allied spheres.

Age: Minimum 21 years, and Maximum 30 years.

The recruitment to the post of Research Associate is **tenurable** initially for a period of **two years** extendable for another term for a period not exceeding 3 years.

APPLICATIONS be sent to the REGISTRAR, National Institute of Adult Education, 10-B Indraprastha Estate, New Delhi-110002 latest by 20th September 1991 on plain paper.

IN THE CHANGING LIFE OF INDIA, there's a growing role for Indal

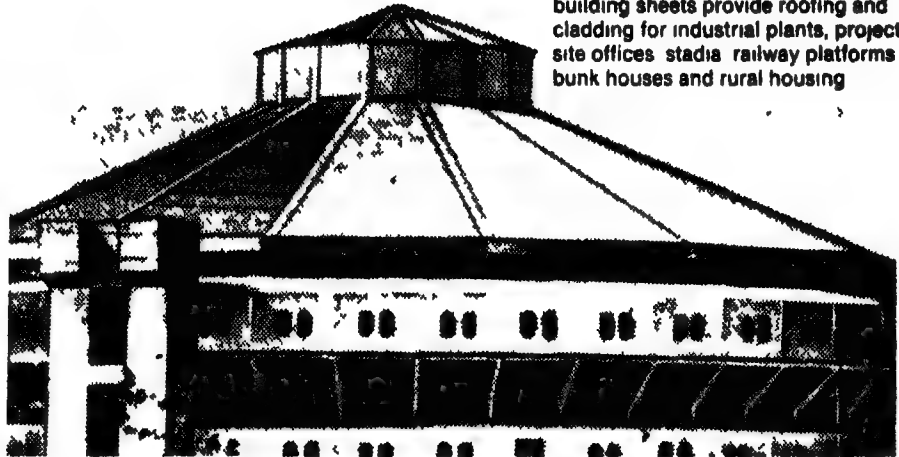

Power transmission

Linked to the country's electrification programme the cable and conductor industry was till recently the major consumer of aluminium—now gradually giving way to a changing consumption pattern

Building construction

Lightweight easy to erect almost maintenance-free durable and comfortable Indal's new generation building sheets provide roofing and cladding for industrial plants, project site offices, stadia, railway platforms, bunk houses and rural housing

Architecture

Exactly in step with today's function-oriented aesthetic Indal architectural sections make frames for doors and windows skylights fixtures and fittings extruded and colour anodised to precision

Packaging

Light durable hygienic and versatile easy to print and laminate Indal aluminium protects and promotes a widening range of products from life saving drugs to perishable food items

Transportation

Ideal light body metal for heavy load-carriers by road and rail aluminium helps boost payload and profits, save energy for transporters, specially for the public transport system

**INDIAN ALUMINIUM
COMPANY, LIMITED**

In India's rapidly changing industrial scenario, traditional products and materials are being steadily replaced by the more functional, sophisticated, high quality items that today's discerning and articulate consumers want. As always in the last 50 years, Indal responds with meaningful innovations and the appropriate technology. Steadily building upon aluminium's unique versatility to enrich the quality of our people's lives

Contd-804

Apartheid Is Dead! Long Live Apartheid!

Nigel Harris

The legal scaffolding of apartheid has been abruptly removed after 40 years and more of construction, leaving the underlying pattern of extreme social inequality intact. But few have begun to face up to the costs of real social change.

WHO would have thought it would be possible to visit South Africa? But the transformation here is nearly as remarkable as in the Soviet Union or Eastern Europe—and for much the same sort of reasons: the inexorable pressure of a new world economic order on antiquated national fortresses, relics of the high noon of economic nationalism in the 30s. The legal scaffolding of apartheid has been abruptly removed after 40 years and more of construction—leaving the underlying pattern of extreme social inequality intact. White South Africa rejoices that at long last the sojourn in the wilderness is over, they may rejoin polite world society; they are even smug at their own virtue. Few have begun to face the costs of real social change. Still 5 per cent of the population own 88 per cent of personal wealth; 61 per cent of the black population are below the poverty line.

I

Real social change there must be, for revolution still ferments beneath the surface in the black townships. There, thousands of volunteers and committees, among them the 'civics', campaign, agitate, sustain boycotts of rent and service payments. In 23 townships, services have been cut off to the fury of the inhabitants. It seems very like Brazil just before military rule ended.

The persistence of agitation, the creation of a generation raised upon the alcohol of revolution, partly explains the change of tack by the regime. After the ferocious repression of the late 80s, the government felt obliged to reverse direction—to recognise the ANC, release Mandela and many others, and negotiate. The government's attempt to create black consultative structures through self-governing councils has all but collapsed. The vote for the councillors in the last elections was derisory, and 200 councillors have felt obliged to resign; 100 councils (of 258) have dissolved themselves for lack of a quorum.

However, the machinery of racialism continues, even as supposedly non-racial society is being created. The low white

birth rate (and changing white migration) has led to many white schools being closed—when there is a desperate shortage of places for black children. The great revolt of the township school students in the 70s led to the sacking of many schools (as well as police stations and liquor shops)—gutted hulks still stand in the townships, silent monuments to fury. They have not been repaired—and 40 per cent of black kids leave school with little or no education. In the same style, there are 4,000 vacancies in white colleges, when 78,000 were turned away from black colleges because of a shortage of places. A major new campaign is under way to occupy white schools and reopen them. But the underlying problem will get worse—the white population is aging, but 82 per cent of the blacks are under the age of 35.

The revolution continues. Sharpeville, Soweto, Alexandra, Cross Roads are the battle honours in the long civil war. But there is little clear and decisive leadership. The ANC tries to construct and develop local branches while negotiating with the government and formulating coherent policy positions on all questions, but so far without great success, although the recent national convention in Durban marks a considerable step forward. But sometimes the aging leadership seems bewildered, as if, after pressing against the Berlin wall of apartheid for 40 years, its abrupt collapse leaves them shocked and unable to act amid the clouds of brick dust. Perhaps this is why, some people say, the Communist Party is growing since it still seems to offer some clear political lead, even though its entire rationale collapsed in the Soviet Union and Eastern Russia (leaving it as a somewhat conservative Social Democratic party).

Without leadership, the dangers grow. Violence in the townships between rival groups, part hoodlums, part political militants, is a different kind of civil war, with the centre-piece of the clash between the ANC and Inkatha. Over 3,000 people have been killed in the last 18 months (770 in the first quarter of this year). Inkatha champions a fictional Zulu identity (no

news in India where fictional collective identities are run up at the drop of a hat), and is well organised in the dormitories of single black migrant workers. The dormitories are the worst of the townships, filthy barracks with broken windows and graffiti, families sometimes occupying them with up to 16 people per room, and razor wire surrounding them (to keep us out or them in?). Inkatha does not, despite its claims, represent Zulus, but the tribal dimensions are carefully emphasised in attacks on Xhosa ANC families. Inkatha has the potential for a home-grown fascism.

Inkatha is wonderful for the embattled whites. They have always needed evidence to support their argument that there are no 'blacks', only different tribes (but of course, there are whites, not Afrikaners, British, Portuguese, French, Germans, etc) and tribes in permanent conflict so that the whites are needed to rule impartially. It is surprising to see once again in use a currency so much employed in the British empire—the invention of political Hindus and Muslims in pre-partition India is a painfully familiar precedent.

There is another chilling parallel, however. In 1929, the Herrenvolk, the businessmen of the Ruhr, began to make collections for an obscure bully boy, Adolf Hitler, not expecting he would come to power or, if he did, expecting he would be entirely controllable. White business in South Africa—and some of the aid agencies—are financing Inkatha as the 'moderates' at the moment. They may also find that they are creating a monster that is not susceptible to control.

The rise of Inkatha as the bully boys to destroy physically the ANC is as remarkable as the emergence of de Klerk and the Nationalist party as holding the middle ground. The government is no longer defensive. With superb effrontery, after the last four decades of Nationalist apartheid, the government now presents itself as the non-racial moderate centre. There is talk of a 'Christian Democratic' centre, supported by the majority of the whites, many coloureds, Indian property owners, and a significant number of blacks, in alliance with Inkatha. It is not nearly as absurd as it sounds. But it hides a nightmare scenario—white finance to help Inkatha destroy the ANC, after which Inkatha takes over from the Nats, to create a black dictatorship, with its own Ton Ton Macoute, in alliance with white business, much as Tshombe tried to do in Katanga.

II

However, in the short term, it is the economy which adds a touch of hysteria

to prognostications. South Africa ought to be a middle income manufactured exporter, based on high growth. But since the mid-70s, it has stagnated. The structure is still an old fashioned corporatist regime, linking a giant state sector with major private monopolies, making cosy profits behind high tariffs. South Africa has followed an import substitution strategy since the 20s, with strong central direction, some denuclearisation after its East European (and Indian) parallels. In fact, South Africa never ended its heavy dependence on raw material exports—easy foreign exchange meant there was little drive to complete the import substitution drive, so manufacturing still depends heavily on imports. From the early 70s, profits have been poor—foreign investment flows began to dry up, and South African business increased its assets abroad (by 1983, the largest South African corporation, Anglo American, had become the largest single foreign company operating in the United States). Sanctions only exaggerated the trends in the market. With net capital outflow rather than inflow and a sagging gold price, it became impossible to sustain annual growth above 3 per cent without a surge of imports. In fact, the economy did much worse than that. In the 80s, output and employment growth were negative. On the index 1970=100, by 1988, when South Korea had reached 365 and Singapore 308, South Africa was a derisory 109. They were years of the locusts.

The problems were made much worse by the soaring public expenditure of the 80s—to finance internal security (and the intervention wars in Angola, Namibia, Mozambique), the tricameral parliamentary system and its associated bureaucracies, increased services to the townships. The government began to borrow to finance current spending. Government employment increased 65 per cent in the 80s (so that over 40 per cent of white employment came to be in the public sector). Thus, while the surface politics suggest an astonishing rehabilitation of the position of the Nats, the state of the economy is disastrous. And the reform programmes all suggest the need to increase white layoffs, sawing off the branch on which the government sits. White unemployment has increased and incomes decreased—soup kitchens operate in some of the white slum areas. 60,000 white farmers (controlling 87 per cent of the land) are being crippled by low prices and high interest rates. The militants in January occupied Pretoria in protest at their destruction. Drought has compounded the miseries and forced closures. Since the white farmers are now no longer protected against the purchase of their land by black farmers, a further dimension of economic agony is added to the ending of apartheid.

A high growth middle income economy, living by manufactured exports, needs a radical devaluation of the Rand, and the generation of jobs quickly enough to

soften the mass of legitimate furies that course through the townships. There are signs of change—in the last six years of the 80s, merchandise exports increased by over 10 per cent per year (the share of manufactured exports grew from 18 to 29 per cent). But it is not fast enough. One factor may be the high price of white labour, although the government endlessly reiterates that high black wages are a source of the country's economic difficulties. The government's problem is how to push rapid growth and redistribute incomes without pulling the temple down on its head.

Meanwhile, some changes are coming about. Inner city white areas are increasingly black, the process began long before legislation made it legal, so City Councils have long been tolerating the erosion of apartheid. A significant black trading community is emerging. The universities, if not the schools, are increasingly mixed. Bank staff is mainly black. Some cities are even discussing the creation of single metropolitan authorities, incorporating the black townships and making possible inter subsidisation.

III

We seem to be emerging from a political ice age. The sound of crashing glaciers is all around us. For whole lifetimes, the political order seemed cut in granite—the cold war monoliths of east and west, the fortress states of which South Africa was such a stark example. Now they are all crumbling, but it is quite unclear what will replace them. The old concepts still persist—South Africa and apartheid have been woven into the psyche of a generation of the Left, an exemplary case of oppression (although many of the caste features of South Africa existed elsewhere in less stark forms). But now it is unwinding. Or its legal starkness is fading. But white society is still intact—the neat hedges and high walls (with Rotweilers and small arms), the Mrs Grundies still tut tut at mild lewdness in the press, and cry out in horror at blasphemy.

And the townships remain. So do the high security lights that mark them. The occasional armoured car is still seen in the townships, frightened young white soldiers peering out. There are black homeless kids sleeping by central heating vents to escape the bitter chill of winter nights on the veldt. Only the tide of rubbish betokens the continuing rebellion, and the slogans ('Viva Saddam' in the Cape Malay quarter, with a hammer-sickle, followed by Junky Funky kids!). The black population watches warily, not at all ready yet to believe anything of substance has changed.

POLITICAL AGENDA OF EDUCATION

A Study of Colonialist and Nationalist Ideas
KRISHNA KUMAR

Examining India's educational development over the last 50 years in the context of political ideologies and formations, Prof. Krishna Kumar argues that colonial and nationalist discourses of education were homonymous. That while the two discourses were intended to convey divergent messages they used the same vocabulary and as many important concepts in education were concerned. The terms of educational discourse that are in use to this day are rooted in this ambivalent heritage.

Divided into two sections, the first dealing with the dynamics of colonial rule and the second dealing with the politics and values of the freedom struggle, this book reveals that colonial rule did not introduce a new type of education as is widely believed; it merely re-shaped an existing tradition, altering its epistemology but permitting its pedagogical traditions to remain.

Using as it does a highly innovative methodology for interpreting historical texts, this book will be of interest to a professional audience engaged in the fields of education, sociology and history.

History of Cleanliness in France

Mohan Rao

Concepts of Cleanliness: Changing Attitudes in France Since the Middle Ages by George Vigarello; Cambridge University Press, Cambridge, 1990, pp 240, price unstated.

THE excavation of the history of disease is an arena of extraordinarily rewarding gifts to a historian. This arena has lately been mined by long over-due, if tentative, explorations and nuggets of information invaluable to the discipline of public health have been unearthed.

Classics like *The White Plague* which studies the impact of tuberculosis on society come to mind. Or Zinsver's *Rats, Lice and History* which elaborated on the impact of typhus on medieval society and indeed the tide of history. These grand works, rich with historical and epidemiological insights, constitute one genre of studies. The book under review is a classic of another genre: it studies the history of something terribly banal and everyday, offers equally rich insights.

The plague epidemics of the 15th and 16th centuries devastated medieval Europe. 'Cautious estimates' place the death toll at one-third the population. Depopulation, increase in wages, large-scale migration and strife proved the death knell to the feudal manorial system. It profoundly affected concepts of cleanliness.

DANGEROUS BATH

Cleanliness and washing, Vigarello tells us, had not been the real purpose of the early medieval bath. The bath was dedicated to the pleasures of water and sociability but by the end of the 14th century had come to be frowned upon. Places of dissipation, they were perceived as sources of political trouble. As more and more municipalities banned them, a visit to a bath "turned into a confrontation with the law". In 1526 Erasmus noted "Twenty five years ago, nothing was more fashionable in Brabant than public baths. Today there are none, the new plague has taught us to avoid them".

Contemporary medical opinion ruled that bathing increased susceptibility to plague. "Steam baths and bath houses should be forbidden" proclaimed one, "because when one emerges, the flesh and the whole disposition of the body are softened and the pores opened, and as a result pestiferous vapour can rapidly enter the body and cause sudden death, as has frequently been observed". The Royal Physician observed "The bath, except for medical reasons when absolutely necessary, is not only superfluous, but very prejudicial to men. The bath destroys the body, and, filling it, renders it susceptible to the effects of the bad properties of air

Bathing fills the head with vapours. It is the enemy of the nerves and ligaments, which it loosens in such a way that many a man never suffers from gout except after bathing. It kills the child in the mother's womb even when it is warm."

Proffered such dire advice it is no surprise to learn that Louis XIV had just two baths in his life, both medically supervised, and both apparently made him terribly ill. The bathrooms and the marble baths at Versailles, designed to recall ancient Rome, were replaced, the bath itself becoming a garden pool.

Vermin (and therefore delousing) was an accepted part of life. Physicians attributed this proliferation of parasitical fauna simply to an excess of bodily humours—to be cured by diet and purging. Washing with water was confined to the visible parts, the hands and face, and these, for reasons of etiquette. Shirts appearing in the wardrobe in the 13th century are never seen, and seldom, if ever washed or changed. Wealth and elegance was associated above all with heavy external clothing, glowing, colourful set off by fur. Indeed this aristocratic yen for fur was one of the causes for the import of the last great epidemic of plague: the infected flea arriving along with fur from China.

By the 16th century the role of linen had altered: its regular renewal had become a rule for cleanliness. The shirt was still not changed every day though this was now a dazzling possibility. Explains Vigarello "to the unease aroused by baths was added the conviction that it was unnecessary. Linen absorbed sweat and impurities, changing it was, in effect, to wash."

Medical practitioners laboured to explain this shared sensibility among the aristocracy and the *nouveau bourgeoisie* in scientific terms, "We understand why linen removes the perspiration from our bodies because the sweat is oleaginous or salty, it impregnates these dead plants (viz, the linen) like the grasses which are composed of the same substances". The medical men having given their scientific imprimatur, architects could scientifically conceive of mansions sans bathrooms. We can more easily do without them than the ancients because of our use of linen which today serves to keep the body clean."

With a greater elaboration of courtly society, the invention of etiquette, linen became a symbol of refinement. It was a

cleanliness that distinguished and made a social statement of importance. And with the decline in the fashion for heavy cloth and ostentatious furs, shirts began to abound in the wardrobe. Moliere and Racine, we are told, left 30 shirts each on their death.

Cleanliness, then, was a condition of power, it could not exist for the poor. Accompanying the increasing use of linen among the elite was the habit of powdering hair which dispensed with washing the hair while enhancing appearance. The 17th century also refined the use of perfume: perfume not merely guarded against dangerous miasma but elaborated social codes. Three types of perfume were distinguished, one for the aristocracy, a second for the *bourgeoisie* and a third for the poor. The last was not aesthetic, merely therapeutic, "composed of common oil mixed with soot it served only to disinfect the air".

EFFULGENT BATH

By the middle of the 18th century, however, the bath had reappeared among the aristocracy. Though extremely rare (the *Architecture Francaise* of 1750, we are told, recorded the plans of 73 Parisian mansions of which only five had bathrooms), the essential accoutrement of bathing, the bath tub, made its way into the *Encyclopedie* of 1751 which gave a definition and a description of this item of furniture. And for the first time in 1759, a text on the art of beauty was introduced by a long eulogy of bathing. A luxurious bathing establishment for a restricted elite was built on the Seine in 1761. Duly recommended by the Faculty of Medicine ("The cures operate by displacing by a greater force the strange humours which form stoppages in the painful membranes and in the muscles swollen by their presence". The influence of Newtonian physics is obvious in this recommendation!), the bath cost three livres at this time, Vigarello tells us: the daily wage of a craftsman was half a livre and that of a day labourer, about a quarter.

But nonetheless the medical establishment as ever setting its priorities, was strongly interested in this subject. There were a spate of medical monographs on bathing, indeed the Dijon Academy in 1755 posed for itself the topic "The virtues of the simple water bath". The verdict, predictably, was that the chief virtue of the hot bath was that it soothed by making the humours circulate. By the 1760s complete sets of bathrooms furnishings had entered the market. The bourgeoisie were quick to imitate the aristocracy. But with a difference.

Cold water was now reputed to work therapeutic magic. "There is no method as effective as cold when it is a matter of dissolving blood or evacuating glutinous matters attached to the lining of the vessels, when you want to cleanse the glands and procure a more abundant filtration of

animal spirits or make them run more rapidly in the nerves; when you need to induce urine or dissolve obstructions in the liver, the spleen, etc."

The hot bath was dissipation; the cold bath toughening, invigorating. The bath, for the first time, had an explicitly hygienic role though less because it cleansed than because it strengthened. So powerful was the image of the mechanical actions of water that its effect on the 'bodily machine' was studied rather than its effect on the cleanliness of the skin.

The hot bath was condemned as the practice of a decadent class. Observes the author "A new class, in the face of aristocratic models, invented a strength. It did so by reactivating vigour and dynamism. It definitively separated a new asceticism from conspicuous indolence."

The cold bath was squarely on the political agenda. Rousseau, recalling the noble savage glorified it. "Whenever the government wishes, it can change the feeble constitution of our Parisians, and make them as robust as our German neighbours: all that is needed is the construction of a bath at the edge of the Seine" was the Utopian dream of a revolutionary pamphlet in 1801. And indeed a school of swimming was inaugurated, "endorsed by the provost of the merchants, the Academy of Sciences and the Royal Medical Academy".

The hygienists recommendations emphasise the overarching influence of the bourgeoisie. The cold bath was a symbol of vigour, industry, robustness and above all the indicator of a code, hitherto unknown, of bodily efficiency. Cleanliness was opposed now to 'vain affectation', it was not contrasted with dirt.

Medical opinion was speedily available: "The perspiration intercepted by the accumulation of powder congealed with pomade and sweat flows back into the neighbouring parts and causes catarrhs, disorders of the throat, the ears and the eyes."

DAWN OF PUBLIC HEALTH

There was a major shift in thinking towards the end of the 18th century. The medical gaze widened its horizons. This is attested to by the publication of *La Gazette de sante* in 1773, the creation of the Royal Society of Medicine in 1776, the enquiries into epidemics and the fashion for medical topographies recording differential mortality in the town and country. The population came to be seen as a resource whose life span must be increased, in the interests of economy. The Physiocrats contributed largely to these perceptions by linking the wealth of the nation and the productivity of the people.

The concept of prevention of disease applied to communities to transform their state of hygiene took hold. This involved a larger political role for medical people. As medical enquiries revealed the relationship between poverty, overcrowding and disease, efforts were made to improve ventilation and water

supplies. It was now considered essential for towns to have water facilities, not for ensuring water for bathing or washing but to flush out dirt from streets and for clearing the air of miasma.

The word hygiene came to occupy a new and respectable position. It congealed into a specific discipline, displaying scholarly appertunances. It was invoked in the planning of towns and other public places. It lay no claim to "new knowledge of the laws of health but a greater determination to assert a total knowledge, an insistent emphasis on a 'scientific' competence".

New institutions were created to bequeath it with honour: commissions of health, the inspectorate of factories and workshops and, the crowning glory, the chair of hygiene in the faculty of medicine.

A science was created, not infallible. Around the 1830s, a new idea gained ground and scientific evidence rapidly gathered around it. This was of the respiratory function of the skin and the purifying function of warm water. Along with experiments which may only be termed grisly ("Bouley when he coated the shaved hide of horses with tar, observed in 1850, 'all the effects of a slow asphyxiation'. Death appeared (sic) even quicker when a strong glue was mixed with the tar") was born the concept of an organism which burned. "Steam engines became far more attractive models than levers."

The response to the cholera epidemic of 1832 was quick and entirely new: more street fountains, watering of streets, chlorine in cesspools—though chlorine's disinfecting properties were still to be discovered—and the promulgation of measures for increasing the circulation of air and water. The cholera epidemic provided the impetus for the laying of the underground grid of pipes both for delivering and evacuating water and wastes in a feat of sanitary engineering involving doctors.

Baths were encouraged as an additional defence against contagion. But how prevalent was the practice? "One bath per inhabitant per year under the monarchy of Louis XVIII" says Vigarello. The sanitary gaze now turned to the poor. "For what really changed in fact, was the image of the poor and above all of poverty which became more disquietening and more threatening with the advent of the new industrial towns. The bourgeois imagination was firmly wedded to the concept of a dirtiness which purveyed vice, whose rags and vermin were signs of an ever present potential lawlessness and, at least, delinquency."

The responses were therefore, policies of dispersal—the sad and brutally familiar response of town planners—and in the sphere of hygiene, moral exhortation or health education. Hygiene also entered school curricula "to be learnt by heart by the pupils of the six first classes". A new outbreak of cholera in 1849 gave a new sense of urgency. Councils of health, now established in all provinces, passed recommendations on the creation of free public

baths for the poor "because people acquainted with cleanliness are soon acquainted with order and discipline".

At the end of the 19th century Remlinger carried out a day by day enumeration of the microbes in his bath water. The bacteriological world that had been unveiled by Pasteur fundamentally altered the concept of washing. This new 'avatar' of cleanliness took its battles beyond the boundaries of the visible. The world, it was now revealed, pullulated with 'invisible monsters'.

The bodily zones traditionally the concerns of treatises of manners—hands and face, mouth and teeth—were rapidly the concern of hygiene. Medical men particularly suspected the hands of workers; "with coachmen and workmen have been found in about 50 per cent of cases, golden and white staphylococcus, the micro-coque pyogene of the saliva and the liqued pyogene staphylococcus".

Cleanliness, in fact, changed its meaning: it now meant asepsis. This had immediate impact in hospitals where the incidence of post-operative infections was greatly reduced; surgeons now operated with sterile gloves on instead of with bare hands. Hygienic cleanliness acquired at the end of the 19th century a legitimacy unsurpassed. The metaphor most frequently employed by doctors now "Every machine needs its wheels to be frequently cleaned and the cinders or unused parts of the coal to be as frequently cleared out. The human body being a particularly delicate machine, it is necessary to see to its cleanliness and the regular expulsion of its waste matter."

This vision of the human body, extended in similar metaphors to a city, transformed the urban landscape. Bathrooms and toilets were now a must in every household; an

elaborate underground grid of water pipes and sewage pipes lay concealed. In bourgeois households, the accoutrements considered necessary were limited only by the consumerists' imagination. And for the *hoi polloi*? The utilitarian shower was perfected in prisons.

Vigarello draws on a daunting variety of sources—sanitary reports, archival records, architectural volumes, paintings, diaries, letters and even statuary—in creating this fascinating account. The book is a must for not just those interested in history and public health but for all bibliophiles.

Experiment in Education

R Akila

Life at School: An Ethnographic Study by Meenakshi Thapan; Oxford University Press, New Delhi, 1991; pp ix + 271, Rs 250.

THIS ethnographic work on the Rishi Valley School (RVS), a brain-child of philosopher Jiddu Krishnamurthi (JK), is on school as a socio-cultural phenomenon. As part of her interest in JK's educational thought, Thapan has raised an array of issues on the internal organisation and authority structure in RVS, on the nature and form of the culture of participants, viz. teachers and pupils, in the pedagogic process, and on the various networks of teacher-pupil interaction and has systematically analysed the various units involved in the functioning of a school as an institution. Of the nine chapters which the book contains, the first is a general introduction to RVS; the second is on JK's worldview and educational thought, which emphasises the psychological rather than the technological aspects; the third is on the orders and principles in RVS; the fourth and fifth are on school culture and teacher culture respectively; the sixth is on teacher interaction; the seventh is on pupil culture; and the eighth is on teacher-pupil interaction. The concluding chapter is an assessment of JK's ideology in relation to the school and the larger society.

In the few Krishnamurthi schools spread over the country and even abroad, the inter-relationship between teachers, pupils and parents is a vital factor. In analysing this relationship in RVS, Thapan has looked into JK's philosophy as contained in his writings and speeches, in particular his distrust of any form of authority in a school situation, his insistence on viewing individuals through their relationship to society, and his concern for an 'inward revolution' for awareness/self-knowing, and for cultivation of 'total human beings'.

In explaining the school as a socio-cultural reality, in terms of its structure and principles, she has differentiated between the two prevalent orders in RVS, namely, 'transcendental' and 'local'. The first is normative as formalised by JK on how the school ought to function. The second is positive, as it exists subject to the pulls and pressures from outside the school. The interplay of these two orders perhaps lends RVS a distinctive blend. Also operating in RVS are at least three different sets of goals, namely, official, operative and instrumental. The first type is often directed towards instilling JK's ideology in the students; the second helps for the smooth routine of school activities; and the third is resulting from the

external administrative environment, say the general norms in Indian schooling.

Thapan's discussion of the key functionalities engaged in either transmitting the moral order (an expressive dimension of RVS), or controlling the curriculum and evaluation patterns (an instrumental dimension for preparing students to meet the future demands of society) throws light on the principles underlying the control/power structures in RVS. Her analysis of the processes of decision-making in RVS brings out clearly that the authority of the Krishnamurthi Foundation is so pervasive that some of the members of management and teachers resent its constant and often critical gaze.

A description of school rituals and ceremonies—an affirmation of the school's ultimate values, shows how these factors have created a 'school ethos' and a 'school culture' by integrating teachers and pupils. Routinised rituals like the morning assembly consisting of non-secular (only Hindu) prayers and the evening meet called 'astachal' (literally 'watching the sunset') in RVS are followed according to the transcendental order. Certain other rituals like observance of republic day and independence day are according to the local order. All these routinised and 'dramatised' rituals impart a certain regularity and discipline, and even instil a sense of hierarchy among teachers and students. In a ritual like morning assembly where both teachers and pupils participate almost equally, the hierarchy is implicit, while in a ritual like the weekly test where the teacher exercises an obvious control over pupils, the hierarchy is explicit.

In her account of the 'teacher culture', Thapan has closely examined its several strands like the multiple roles of a teacher in relation to management, other teachers and pupils. The pattern of recruitment in RVS is explained on the basis of two different types of teachers that the school depends upon, namely, the 'ideologue teachers' who are expected to be committed in their role to instil JK's ideology in the pupils; and the 'professional teachers' for whose recruitment training/experience in the subject to be taught, social background and intelligence are the criteria. Thus, in RVS there exists different ranges of commitment to ideology among teachers, ranging from superficial to total indifference, depending upon their differential orientations.

Thapan has shown that the 'teacher culture' varies from the RVS junior to RVS senior and the perpetuation of a certain type of culture is a result of institutional factors like staff meetings, seniority/juniority in service, and the interpersonal considerations often ridged between ideologue and professional teachers. Social factors like the peer group or informal friendships among teachers also define the nature of teacher culture to an extent. An interesting observation made in this regard is that informal friendship group is hardly found among men, much less among women, and almost never across gender groups. Her discussion of the 'teacher culture' is sustained by her case studies of ideologue and professional teachers.

In her analysis of the pupil culture, Thapan has dwelt on the management's efforts to promote a uniformly positive 'pupil culture' by carefully selecting students from a 'cultured background with certain sensibilities', that is from the upper strata of urban society, and how despite such efforts, both positive and negative attitudes exist among students towards the school and its ideology. In doing so, she has looked at students' attitudes on aspects like choices for leisure time activities, preferred attributes for pupil popularity and unpopularity, perceived changes in disposition due to RVS experiences and the degree of personal favour to various aspects of the school.

Thapan's account of the teacher-pupil interaction has clearly brought out the central aspect of school (but not the teacher) as a controlling agent. The relative absence of teacher's authority to control students in a typical RVS classroom is explained through the different ways used by teachers in dealing with pupil participation. There are only few instances when teachers use a domineering strategy to evoke fear among students in order to prevent them from taking undue advantage.

Her conclusion that "the double standard situation in RVS created by the co-existence of the transcendental and local orders" results in chaos and ideological tension in different situations, may be disheartening to some. But this point is most emphatically driven home in her discussion of the ideologue vs pedagogue case study and the possibility of conflict when both types of teachers deal with the same set of students.

The book is mainly based on data collected by Thapan from RVS between 1981 and 1988. In a postscript she has noted that the transcendental order has almost lost its place after JK's demise and that the resulting absence of tension between it and the local order has had a positive effect on the school processes.

While the book has certainly succeeded in explaining RVS more as an experiment with JK's educational thought than as a model of education, and in rendering this institution intelligible sociologically, what is missing is an explanation of how this model could be incorporated into mass education and how it could thus be made relevant to the larger society.

The Macroeconomic Adjustment Programme

A Critique

Mihir Rakshit

The government has chalked out a programme for macroeconomic adjustment over the short and the medium run in order to resolve the fiscal crisis and tackle the problems of inflation and the balance of payments. Our primary focus in this paper will be on the macroeconomic adjustment policies embodied in the union budget, though we have also to consider the medium run macro implications of the exim policy, delicensing of industries and financial liberalisation.

The fiscal management undertaken in the budget raises a number of important issues. First, how far is the finance ministry's perception—which incidentally is identical with that of the IMF—of the impact of fiscal parameters on macroeconomic variables correct? Second, assuming that the government's diagnosis of the ailing economy is sound, do the proposed steps constitute the right cure for correcting the macro imbalances? Finally, what are the implications and costs of the macroeconomic adjustment initiated by the government? Does the budget seek to minimise the burden of adjustment without sacrificing the basic short and long run objectives?

And zealotry has virus so concealed,
It's hard to tell the poison from the cure!
—Goethe, *Faust*, Part I

FACED with the balance of payments problem and the fiscal crisis, the government of India has initiated far-reaching changes in economic policies on all major fronts. The debate over these changes has run on fairly predictable lines with the liberal economists firmly reasserting their faith in the free market mechanism and the leftists voicing their deep suspicion of the IMF conditionalities, especially those in respect of liberalisation of trade, finance and industry. It is necessary however to go beyond articles of faith and examine how far or to what extent the policy package adopted by the government, irrespective of its source, is suitable for attaining our major economic objectives (about which there appears to be a large measure of unanimity among economists of all hues).

The long-term objective of the new policies is to promote efficiency and enterprise through delicensing of industries, liberalisation of the financial market, decontrol of foreign trade and free entry of foreign capital. Meanwhile a programme has been chalked out for macroeconomic adjustment over the short and the medium run in order to resolve the fiscal crisis and tackle the problems of inflation and the balance of payments. Our primary focus in this paper will be on the macroeconomic adjustment policies embodied in the union budget, though we have also to consider the medium run macro implications of the exim policy, delicensing of industries and financial liberalisation.

There is a fair degree of consensus regarding the basic causes and characteristics of macroeconomic imbalances in the Indian economy during the 80s. Attention has repeatedly been drawn to the increasing reliance on borrowing and deficit financing to meet government expenditure; to the

higher rate of inflation experienced in this period compared with the earlier decade; and to the growing foreign indebtedness and worsening balance of payments situation. The ministry of finance has in fact identified the fiscal deficit as the villain of the piece and suggests, "At a macroeconomic level, fiscal deficits inevitably spill into balance of payments problems and create inflationary pressures in the economy" (*Economic Survey 1990-91*, p 99). Hence the finance minister accords top priority to the reduction of the fiscal deficit from 8.4 per cent of GDP in 1990-91 to 6.4 per cent in 1991-92. In order to realise this objective the budget proposes curbs on government expenditure on both the revenue and the capital account; a 20 per cent disinvestment in shares of selected public sector undertakings; and greater reliance on the issue of bonds and debentures by public enterprises to finance their investment projects.

The fiscal management undertaken in the budget raises a number of important issues that have not received adequate attention

from the proponents or the critics of the new policy. First, how far is the finance ministry's perception—which incidentally is identical with that of the IMF—of the impact of fiscal parameters on macroeconomic variables correct? Second, assuming that the government's diagnosis of the ailing economy is sound, do the proposed steps constitute the right cure for correcting the macro imbalances? Finally, what are the implications and costs of the macroeconomic adjustment initiated by the government, or does the budget seek to minimise the burden of adjustment without sacrificing the basic short and long run objectives?

I

Fiscal Roots of Macroeconomic Imbalance

There can be little doubt that fiscal policy played an important role in influencing the behaviour of the Indian economy over the last decade. But students of economics can-

TABLE 1: FISCAL DEFICIT, BALANCE OF TRADE AND INFLATION

| Year | Fiscal Deficit | Public Sector Borrowing | Export | Import | Import-Export Gap | Current Account Deficit in BOP | Rate of Inflation |

Source: *Economic Survey*, 1990-91.

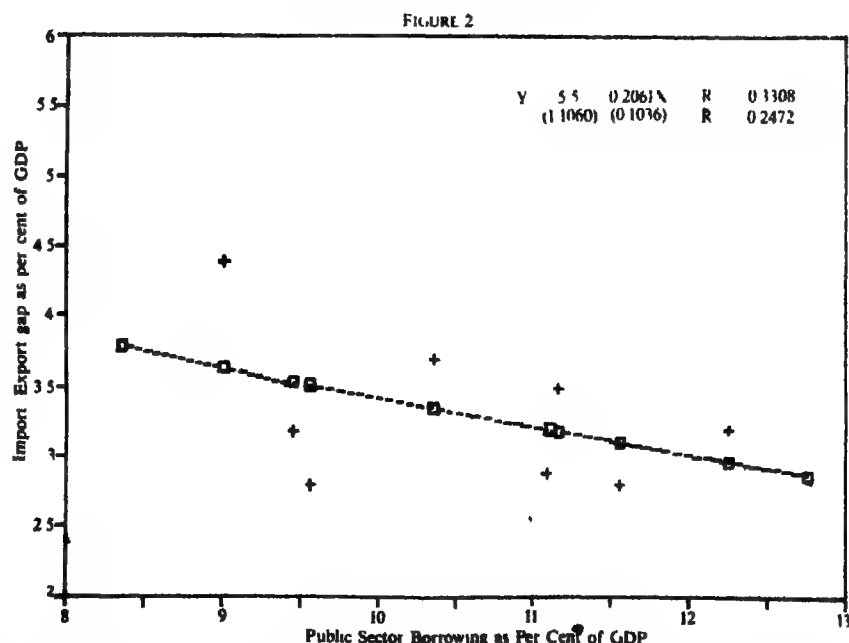

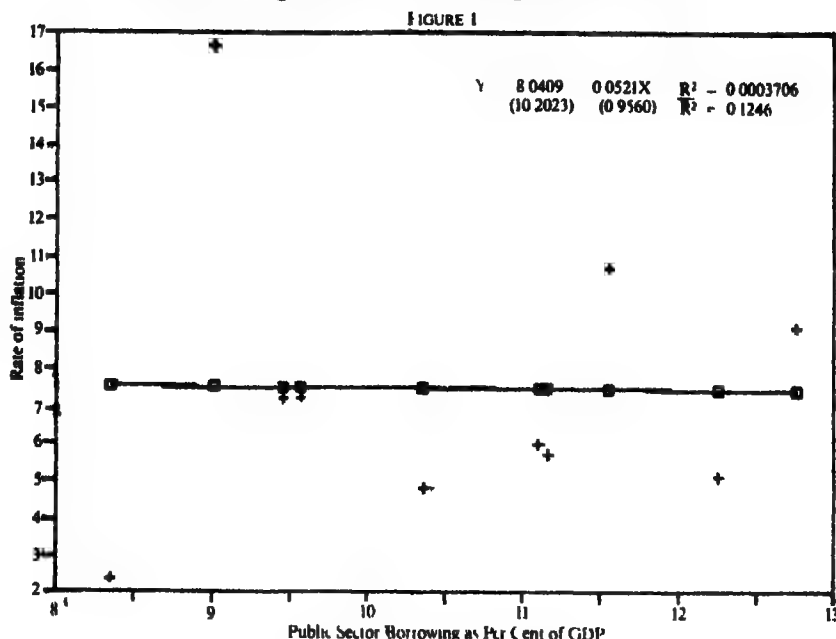

not but be puzzled by the focus on the fiscal deficit as the chief explanatory variable and the most important policy parameter of the ministry of finance. Indeed, neither empirical evidence nor economic logic suggests that reduction of fiscal deficit should be the prime concern of the government in the process of macroeconomic adjustment.

Consider first the empirical evidence for the 80s during which the fiscal imbalance assumed alarming proportions. Fiscal deficits, as Table 1 indicates, can in no way be regarded as an explanatory variable for inflation or the trade deficit. Since the data seem to run counter to the most important presumption behind the IMF/finance ministry approach, let us go into the problem a bit more carefully. Column (1) of the table gives the fiscal deficits of the union government as a percentage of gross domestic product at current prices. It may be argued that the more relevant measure of fiscal deficit in this connection would be the borrowing of the public sector consisting of the central government, state governments, union territories and public sector undertakings (net of intra public sector loans). Hence in our simple regression analysis it is this broader measure of fiscal deficit (to be denoted by FD_b hereinafter) that is used as the explanatory variable, though the qualitative results are the same for both the narrow and the broad measures of fiscal deficit.

Our analysis suggests that fiscal deficit cannot account for the rate of inflation in the 80s: the regression line, as shown in Figure 1 is almost horizontal and constitutes a severe indictment of conventional wisdom in this regard. So far as the import export gap is concerned, not only is the regression result almost insignificant, but the sign of the coefficient of FD_b turns out to be negative (Figure 2). In fact, similar counter-intuitive results are obtained for exports and imports separately. Even when the lagged value of FD_b is introduced as an additional explanatory variable, things do not improve: the regression results remain insignificant and the values of R^2 abysmally low. It is only in the case of current account deficits in the balance of payments that the regression result becomes significant even though R^2 (378) is not very high (Figure 3).

A moment's reflection suggests that, notwithstanding the widely held view, it would have been surprising if we got robust empirical evidence regarding the effects of fiscal deficits or public sector borrowings. In interpreting the regression results it is useful to remember the mechanism through which fiscal deficits are assumed to generate inflation and balance of payments problems. We propose to examine later the interaction between domestic demand and balance of payments. Even without going into the details of this interaction, it is not very difficult to see that in a regime of import control, domestic demand can have an effect mainly on the export but not on the import front. However, the impact of FD_b does not appear to be significant even on exports in

Public Sector Borrowing, Inflation and Foreign Trade Scatter Diagrams and Linear Regression Results

the regression result (not shown) the coefficient of FD_b has in fact the wrong sign! The presumed causal link running from FD_b would not work for other items in the current account deficit in the balance of payments, viz, interest on foreign debt, remittances from abroad or foreign assistance. If a substantial part of government borrowing is used to meet the servicing of foreign debt, we will find an association between FD_b and the current account deficits in the balance of payments, but here the causation runs from the latter to the former rather than the other way round. Alternatively, easy availability of foreign loans might induce the government to go in for a spending spree abroad. These examples illustrate the danger of the poor specifica-

tion of the causal mechanism in analysing economic phenomena or drawing policy conclusions.

The government's concern at the growing fiscal deficits is due not only to their effects on inflation and the balance of payments, but also to the apprehension that the deficits would become unsustainable in the none too-distant future when the fiscal machinery of the government becomes, or is perceived to be, incapable of meeting its debt obligations. If matters indeed come to such a pass, creditors at home and abroad would lose faith in the solvency of the government and economic chaos and confusion would rule supreme. This is quite a legitimate concern, but the problem is that the fiscal deficit is not a good indicator of the sustainability of

government borrowing in the medium or the long run. In order to spell out the nature of the problem and identify the policy parameters relevant in the context of macroeconomic adjustment, we need first to take a quick stock of the various concepts of deficits used in the budget document and indicate their economic significance and their relevance for analysing the macroeconomic impact of budgetary operations

II

Fiscal and Budgetary Deficits: Some Definitions and Issues

In recent years the official documents have listed the following concepts of deficits in the government accounts¹

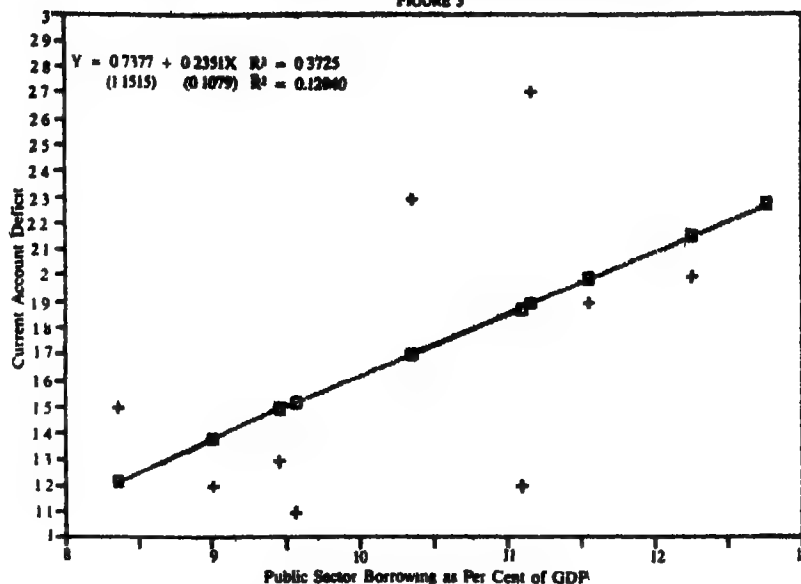

- (1) RD (Revenue Deficit) = Revenue Expenditure - Revenue Receipts
- (2) BD (Budgetary Deficit) = Total Expenditure - Total Receipts (excluding net sale of Treasury Bills)
- (3) DF (Deficit Financing) = Increase in Net RBI Credit to the Government
- (4) FD (Fiscal Deficit) = Total Expenditure - (Revenue Receipts + Recovery of Loans + Receipts from the sale of assets)
- For the sake of completeness we may include two other concepts of deficits that figure in the literature on public finance
- (5) DCA (Deficit on Capital Account) = Capital Expenditure - Capital Receipts (excluding net sale of Treasury Bills)
- (6) PD (Primary Deficit) = Fiscal Deficit - Interest Payments

RD is the deficit generated through current transactions in the budget and denotes the dissaving of government administration and Defence BD, as noted in (2), indicates the amount of government expenditure financed through net sale of Treasury Bills during the financial year (irrespective of who buys these bills) DF gives the net increase in the Reserve Bank holding of Treasury Bills plus other government securities less increase in government deposits with the Reserve Bank. Hence DF is nothing but the increase in reserve or high power money on account of net lending to the government by the Reserve Bank. FD, it is clear from the rhs of (4), constitutes the increase in gross indebtedness of government administration and defence to the rest of the economy (or the world). It follows from the earlier relations that DCA is the sum of net sale of Treasury Bills less the revenue deficit of the government. Finally, PD stands for gross borrowings of the government required to meet all expenditure less interest payments.

The relevance or the usefulness of these various concepts of deficits depends on the purpose at hand and on the extent they can be manipulated by the government for attaining its economic objectives. From the viewpoint of economic analysis and policy prescription our focus, let us remember, has to be on the significance of these deficits for the generation of aggregate demand or in

Public Sector Borrowing, Inflation and Foreign Trade Scatter Diagrams and Linear Regression Results

FIGURE 3

flationary pressures, for the overall saving ratio or economic growth, for the transfer of resources between the private and the public sectors, and for the sustainability of public debt or the solvency of the government

III

Aggregate Demand, Inflation and Balance of Payments

The deleterious macroeconomic effects of the fiscal (or other) deficits are generally identified through the following saving investment relation for an open economy

$$(7) (I_p - S_p) + (I_g - S_g) = M - X$$

where I_p = private sector investment, S_p = private sector saving, I_g = government sector investment, S_g = government sector saving, M = imports of goods and services, and X = exports of goods and services. For medium-run policy analysis it may be useful to recast (7) in following terms

$$(7a) (I_p - S_p) + (I_g - S_g) = (m - x)$$

where the lower case letters stand for the ratios of the corresponding macro variables to the gross domestic product

The lhs of (7) indicates the excess of domestic investment over domestic saving and the rhs the net inflow of foreign resources (or the increase in the net indebtedness of the country to the rest of the world). On the basis of (7) or (7a) it may not seem unreasonable to argue that an increase in the investment-saving gap in the government sector will raise excess demand in the domestic market and hence add to the inflationary pressures and enlarge the import export gap. It may also be claimed that inflationary tendencies and loss of competitiveness of the country's exports will be the greater the closer the economy operates to the full capacity level. But even if the argu-

ment is correct, it is not appropriate to focus on the fiscal deficit as the key policy parameter for solving the problems of inflation and the balance of payments. Note that the fiscal deficit *does not* represent the investment saving gap in the government sector—the variable through which the macroimbalances are assumed to occur. For one thing, in the usual definition of fiscal deficit the operations of public sector enterprises, as we have noted, are left out of the picture. The broader concept of fiscal deficit, FD_b , for the government sector comprising government administration and defence and public undertakings is given by

$$(8) FD_b = FD + \text{Borrowings of public sector enterprises (excluding loans from the central and state governments)} - \text{Recovery of loans and sale of assets by public sector enterprises} = \text{Increase in gross indebtedness of the government sector}$$

However, as may be seen from the following relations, even this broader definition of the fiscal deficit fails to indicate the investment-saving gap in the government sector. Note that

$$(9) FD_b = RD + U_g + \text{Loans given (or financial claims acquired) by the government sector} - \text{Retained profits of public enterprises} - (\text{Recovery of loans plus sale of assets by the government sector})$$

But since S_g is nothing but retained profits of public enterprises less the revenue deficit, equation (9) yields

$$(9a) (I_g - S_g) = FD_b + \text{Net recovery of loans}^1 + \text{Sale of assets}$$

The difficulty with even the broader concept of fiscal deficit, it is thus clear, lies in its treatment of tax collections and sale of government assets on exactly the same footing—a palpably absurd procedure for any macroeconomic evaluation of the budget. As the relation (9a) suggests, if the

PAIN
means
your loved one
needs
an operation
and you
don't have
the money.

Face it. Should you or your near and dear ones ever need hospitalisation and medical care, you just cannot postpone payment of these bills. Even if you cannot afford them.

Mediclaim offers the perfect solution to this problem.

Mediclaim - when you need it most

For payment of an annual premium, Mediclaim insurance pays for hospitalisation, domiciliary hospitalisation, intensive care, surgery and other related medical expenses for you.

Mediclaim offers a choice of two schemes. Scheme A offers regular Mediclaim plus Personal Accident benefits. Scheme B offers Mediclaim benefits only.

A choice of six levels of benefits and corresponding premium payable is available.

Premium ranges from Rs. 200 to Rs. 1500.
Maximum benefit under Mediclaim is Rs. 96,500.
Maximum personal accident benefit is Rs. 1,50,000.
Mediclaim - now with better benefits

Effective April 1, 1991, Mediclaim insurance has been revised to offer better benefits with no increase in the premium payable.

- Choice to existing Mediclaim policyholders to opt for revised terms provided no claim is reported till March 31, 1991.
- Increased limits for hospital room charges.
- Better intensive care and domiciliary hospitalisation benefits.
- Simpler categories of benefits.
- Reimbursement upto 75% cost of medical check up.

Tax Relief: Under Section 80D of the Income Tax Act, premium paid by cheque upto Rs. 3000 is deductible from taxable income.

Some of the other household/personal insurance schemes for you:
• BHAVISHYA AROGYA • OVERSEAS MEDICLAIM • HOMEHOLDER'S
• COMPREHENSIVE • PROFESSIONAL INDEMNITY • PERSONAL ACCIDENT
For full details, see Mediclaim policy.

Now even better!

MEDICLAIM

A simple necessity

investment-saving gap in the government sector is indeed the relevant indicator of the inflationary and the balance of payments effects of budgetary operations, the impact of government sector borrowings, recovery of loans and sale of shares in public undertakings would be the same and the opposite to that of revenue receipts or profits of public enterprises. Before examining the causal connection subsumed in this approach, let us estimate, ignoring market borrowings and other relevant items in the state budgets, the investment-saving gap in the government sector as per the central government budget for 1991-92. The gap for 1991-92 amounts to Rs 56,142 crore against a fiscal deficit of Rs 37,727 crore (Table 2). Even so, if the budgetary calculations do not go awry, the gap will be lower in absolute terms than in the earlier year and come down from 11.1 to 9.6 per cent of gross domestic product—a decrease of 1.5 rather than 2 percentage points.

Should we then regard the current fiscal exercise as a step in the right direction in spite of the misplaced focus? In the present context the answer to the question depends partly on the validity of the investment-saving gap as a good measure or indicator of macroeconomic imbalance. Before turning to the economic significance of this measure, let us look at the empirical evidence once again.

It is fairly obvious from Table 3 that neither the rate of inflation nor the import-export gap in the 80s can be attributed to the excess of investment over saving in the public sector: regression results (not reported here) for both the relations turn out to be insignificant. Even if there is strong empirical support for the hypothesis that the investment-saving gap in the government sector widens the trade gap and generates inflationary pressures, there remain serious problems of interpreting the evidence and using it for the formulation of budgetary policies. For an appreciation of these problems we have to go into the mechanism through which the discrepancy between i_s and s_g may conceivably affect the rest of the economic system.

Note, first, that relation (7) or (7a) by itself does not give any clue to the economic mechanism involved in the determination of the three gaps: these relations, as stated, are no more than identities and the causal links among the variables can be forged only by incorporating the behavioural relations of the economic agents, e.g. consumers, private investors and foreign buyers and creditors and by taking explicit account of the fiscal, monetary, trade and other policies. Further, neither the fiscal deficit nor the investment-saving gap in the government sector is a primary policy parameter. The government can perhaps control its expenditure in nominal terms, fix the tax rates and prices of goods and services produced in the public sector and even manage to secure the targeted amount of borrowing in nominal terms by forcing the Reserve Bank and

commercial banks (through variations in Statutory Liquidity Ratio) to meet the shortfall in the amount of loan extended by the public (or foreign creditors). But the ministry of finance cannot directly attain its targets for revenue receipts and for investment, saving and other macrovariables in real terms or as percentages of the gross domestic product. Indeed, in order to target the budget deficit of any hue (including the investment-saving gap) the government has to know the relevant macromodel and the numerical coefficients of the behavioural and other relations entering the model.

What is more important to recognise in the present context, even when the government can hit the bull's eye in respect of its planned levels of fiscal or other deficits, their economic consequences cannot be judged without reference to the primary policy parameters used to achieve the targets. We have examined elsewhere the economic impact, in the Indian context, of the major budgetary instruments at the disposal of the government and here we propose no more than to recapitulate the main conclusions [Rakshit 1986, 1987]. First, the expansionary effect of a budget, as students of public finance are repeatedly told, depends not only on the deficit but also on the size of the budget: a large budget with little fiscal deficit or investment-saving gap in the public sector can be more expansionary than a small one with a sizeable difference between expenditure and receipts. Second, for a given amount of revenue receipts, personal income tax and export duties tend to reduce aggregate demand to a larger extent than other forms of taxes and hikes in administered prices. Third, the demand generation effects of subsidies and (current) transfers are generally less than government consumption and investment. However, the conclusion is reversed if the transferees belong to the poorer groups or the import content of government expenditure on goods and services is sufficiently high. Finally, while deficit financing is clearly expansionary, there are substantial differences in the crowding-out effects of different categories

of other loans. The crowding-out effect of borrowing from commercial banks (through the SLR requirement) is almost one to one, but the collections from NSC or other highly attractive financial assets floated by the government and public undertakings do not generally have any crowding-out effect whatsoever.

To summarise, it is the size and composition of receipts and payments and not simply the magnitude of fiscal and other deficits that are crucial in determining the effects of budgetary operations on aggregate demand. Hence even if there were strong econometric evidence in support of the widely held hypothesis in respect of the spill-over effects of budget deficits, the reason would generally be that during the reference period (i) there were no significant structural changes in the economy, and (ii) the composition of the budget or the relative weights of fiscal and other parameters remained fairly stable. There is thus no escape from looking at the more primitive relations in evaluating budgetary measures or suggesting some alternative policy package.

In an earlier study we have put forward, with explanatory notes, a rough and ready manual for estimating the demand generation impact of the budget [Rakshit 1986]. We do not propose to repeat the exercise here and remain content with a broad assessment of the main items of receipts and expenditure in the union budget for 1991-92. There are two major provisions in the current budget that are clearly deflationary. First, the absolute level of government expenditure in real terms is going to be cut and what is more important, the cut is much larger for expenditure on final goods and services, especially for public sector investment (note that the major increase in government expenditure will be in interest payments). Second, deficit financing is proposed to be reduced to the tune of Rs 5,280 crore which with a money multiplier of three plus can severely limit the growth of bank credit in the economy. There has been no significant change in the tax structure, nor is disinvestment in the equity of public sector enterprises likely to have any

Government of India, Ministry of Finance, Expenditure Budget 1991-92, Vol I.

O ne of India's leading ambassadors abroad is not a human being.

As a government recognised export house, we've been representing the country the world over in high quality engineering equipment. To technology leaders such as USA, Canada, UK, Italy and USSR to name a few.

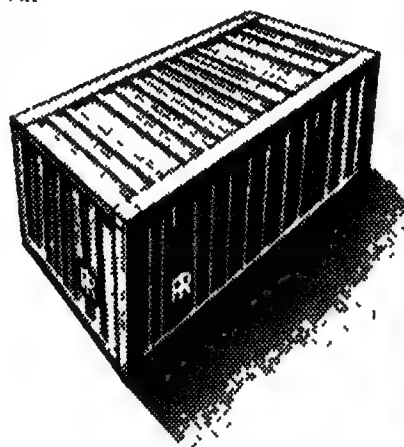

The wide range of compressors exported earns the country over Rs 160 million annually in foreign exchange.

Our professionalism, experience and international network give us the edge to better understand demands of world markets, enabling us to successfully meet problems faced by other Indian manufacturers as well.

Small wonder that Ingersoll Rand has been consistently getting awards for outstanding export performance.

A performance any ambassador would be proud to emulate.

If you have quality products with an export potential, approaching us could be to your advantage.

IR INGERSOLL-RAND

At the forefront in engineering exports.

Ingersoll-Rand (India) Limited Rhone Poulenc House, S.K. Ahire Marg, Bombay 400 025. Tel. 4936765. Tlx. 011 71395. Fax 022 4949416.

IR192.00R

crowding-out effect if the prices fixed for the shares are less than market clearing. So far as the expansionary forces are concerned, they can emanate from lower market borrowings, the boost to private investment in the wake of the new industrial policy and the removal of the ceiling on the interest rate on debentures. On balance the overall effect of the budget is likely to be contractionary at least in relation to the growth of productive capacity in the economy.

INFLATION AND BALANCE OF PAYMENTS

Does our assessment mean that the ministry of finance is on the right track in its quest for the solution to the problems of inflation and balance of payments? Before answering the question let us briefly recapitulate the conventional mechanism regarding the spill-over effects of an increase in aggregate demand. On the domestic front the effect is taken to be manifested in rising prices or/and output depending on the initial degree of slack in the economy. Both the output and the price effect will, however, tend to widen the trade gap because of (i) an increase in income-induced imports, and (ii) a decline in exports along with a rise in imports as domestic prices go up relatively to their international counterparts.⁴ Again, there is a feed-back from the external to the domestic sector, though these tendencies cannot cause changes in the *direction* of movements in prices, output or the balance of trade.

However, there are important clogs or 'wheels within wheels' in the mechanism noted above, especially in the Indian context, and these seem to have escaped the attention of most of the economists commenting on recent policy changes. Consider first the balance of payments effects of an increase in aggregate demand. Apart from the fact that the direct plus indirect import content of different categories of final goods varies all the way from 100 to zero per cent, in India imports, we must bear in mind, have been and continue to be controlled through a wide array of measures. By and large, the expenditure on imported goods is sought to be restricted, often with a time lag, to what may be called "the disposable foreign exchange receipts" (DFER) which is given by the relation

(10) $DFER = (\text{Earnings from the export of goods and services}) + (\text{Foreign assistance plus remittances and external loans}) - (\text{Servicing of foreign debt})$.

In the short run the second and the third (brackets) items on the rhs of (10) are not directly affected by an increase in aggregate demand so that under an import control regime characterised by the above relation there is not much room left for the spill-over of domestic demand to balance of trade: the empirical evidence cited earlier should thus come as a surprise to only those who try to apply text-book results without any regard to the basic assumptions and economic structure in which these results make sense.

An important application of the above line of reasoning is that the availability of foreign loans may cause an increase in trade deficits and when these loans are in the government account they show up in a larger fiscal deficit and investment-saving gap in the public sector. In such cases it is the external factor reflected in trade deficits that generates the investment-saving gap and not the other way round. In fact, in the 80s the government policy of permitting imports of capital goods (irrespective of their domestic availability) so long as the imports could be financed by suppliers' credit or (tied) foreign loans very often contributed towards an increase in the import-export gap; decline in domestic production and government saving; and accumulation of foreign debt. To be more specific, instances are not rare where some state electricity boards were eager to place their order for machinery and equipment with BHEL, but had to take recourse to imports since, while the requisite foreign loans were available for imports, financial institutions in India were unwilling to extend credit for investment from the domestic source. In these instances not only were we storing up trouble for the future on the balance of payments front, but there was also an immediate cutback in domestic production and an almost equal fall in the profits of public sector enterprises so that the gap in government finances appeared in the form of a decline in saving rather than an increase in investment. The provision in the current budget relating to capital goods imports by foreign investors in India is likely to have similar deflationary effects on the domestic sector (if not cause balance of payments problems in future). Such contractionary tendencies originating in the trade sector may, however, be moderated or even reversed to the extent a larger share of the expected increase in export proceeds has to be earmarked for servicing external debts. It is thus a moot point whether the budgetary measures, the requirement of servicing external debt and the response of foreign investors to the policy package will increase

or reduce aggregate demand in the domestic sector. While the present writer perceives the overall impact to be deflationary, he is by no means prepared to bet his last farthing on such an outcome.

Assuming that there is going to be a curb on aggregate demand, what are the prospects of inflation in the near future? Indian economists appear to be sharply divided in their assessment of the inflationary potential of the budgetary and other measures initiated by the government. Attention has been drawn to the cost-push effects of devaluation and increases in the administered prices of petrochemical and other products. But at the same time the devaluation has enabled the government to withdraw export subsidy which along with the additional revenue netted through higher administered prices, curbs on government expenditure and other measures is expected to cause a reduction in deficit financing and aggregate demand so that not only the monetarists but the Keynesians also should expect a substantial fall in the rate of inflation. Should we then turn agnostic and suggest that the outcome would depend upon the relative strength of the two opposing forces, the demand-pull and the cost-push?

Fortunately, it is not too difficult to give a categorical answer to the question posed above. Most of the economists dealing with the macroeconomic problems of developing countries have come round to the view that while open market prices of agricultural goods are flexible, almost all prices in the organised sector (including the public sector) are administered or fixed on a cost-plus basis [Kalecki 1976; Taylor 1983; Rakshit 1982, 1989]. Hence arises the need of identifying the sectoral demand and supply shocks in any assessment of the inflationary potential in countries like India. In the light of this approach it is not very difficult to see that industrial and other prices in the organised sector are bound to rise as a result of devaluation and other cost-push factors noted above. If this effect is coupled with a fall in demand, the result will be an infla-

TABLE 3 INVESTMENT SAVING GAP IN THE GOVERNMENT SECTOR, INFLATION AND BALANCE OF TRADE

| Year | Public Sector Investment | Public Sector Saving | Investment-Saving Gap in Public Sector | Rate of Inflation | Import-Export Gap |
|---------|--------------------------|----------------------|--|-------------------|-------------------|
| | (1) | (2) | (3) | (4) | (5) |
| 1980-81 | 8.7 | 3.4 | 5.3 | 16.7 | 4.4 |

The Hi-Tech Challenge

That's BEML in perspective. It is the winning combination of frontier technologies and diverse applications that has catapulted BEML into the big league of top ranking engineering companies in Asia.

Mining and construction to defence and railway transportation to energy and robotics. In the core sectors of economy BEML is a high performer.

BEML's inherent strengths are many. Modernised manufacturing base, state-of-the-art R&D centre, reliable products and efficient after-sales service.

Constantly breaking new grounds at home and in overseas markets, BEML has been rightly crowned with corporate excellence awards in two consecutive years by the Government of India.

BEML is today moving ahead for a growth beyond Rs. 10,000 millions in early 1990s.

tionary contraction in the organised sector characterised by higher underutilisation of capacity, lower growth and rising prices. So far as the agricultural sector is concerned, it may perhaps be argued that the fall in output and incomes in the organised sector should reduce the demand for farm products and hence their prices. Even if the argument were correct, the (demand-induced) fall in prices would be accompanied by a reduction in agricultural employment and raise thereby the incidence of poverty in rural areas. However, since in the short and the medium run labour is almost a fixed factor in the organised sector of our economy, the decline in the demand for food and other agricultural goods, originating from the non-agricultural sector, is unlikely to be significant. Much more important will be the supply-side shock going to be administered through the new economic policy. First, while fertiliser prices are expected to go up by 30 per cent (under the revised provision), no corresponding adjustment in the procurement prices of foodgrains (and other agricultural products) seems to have been made: the estimated increase in food subsidy is only of the order of Rs 150 crore! The government, it is thus clear, is not going to extend the coverage of the public distribution system and to maintain a price-cost ratio that would induce farmers to supply the required amount of foodgrains.

Second and no less important, even the intended supply of agricultural goods cannot be realised unless adequate production loans are made available to the farmers and there are strong grounds for believing that the package of measures adopted by the government would result in a severe shortage of agricultural credit. While the increase in the prices of fertiliser, pesticides and other inputs is going to raise the amount of loans required by farmers, the fairly large cut in deficit financing will curb the capacity of commercial banks to extend credit. Again, financial liberalisation or rather unfreezing of interest rates on bank loans cannot but cause a sharp decline in the amount of credit going to the agricultural sector, unless special steps are taken to supply adequate loans to farmers at a relatively low rate interest—steps which do not appear to be on the cards.

Our analysis suggests that the IMF approach to macroeconomic policy adjustment initiated by the government is fraught with grave consequences for the Indian economy in the short and the medium run. If the policies proposed are implemented through thick and thin, the economy will experience a decline in the growth of output in both the industrial and the agricultural sectors; a strengthening of inflationary tendencies; and a sharp rise in the incidence of poverty. Viewed against this scenario the prime minister's promise of the provision of a 'safety net' for the indigent cannot but appear as a cruel joke: the government has sought to keep the promise by allotting a princely sum of Rs 2,230 crore under the Anti-Poverty Programme (*Budget at a*

Glance, 1991-92) for more than 370 million India estimated to 'live' below the poverty line [Minhas, Jain and Tendulkar 1991]—a sum which works out to a little over Rs 6 per head per annum.

IV Growth and Sustainability of Budget Deficit

We have already emphasised that contrary to the popular view, fiscal deficits cannot be regarded as the source of inflation or trade imbalances in the 80s. In fact, there are reasons to believe that in this period the increase in government expenditure in relation to revenue collections might have played an important role in enabling the Indian economy to scale the barrier of the Hindu rate of growth. Should we then advocate the continuation of the fiscal policy pursued in the 80s?⁵ The answer, in spite of our serious reservations regarding the IMF-World Bank diagnosis, is in the negative.

There can be little doubt that the demand-driven growth in the 80s characterised by rising budget deficits and a mildly declining overall saving ratio cannot be sustained and must founder against the rock of supply side factors, e.g. low rate of addition to capacity, shortage of energy or foreign exchange bottlenecks. It is for this reason that we require to reverse the trend of declining saving in the public sector if the tempo of growth is to be maintained or raised. Also, with stagnant government revenues and rising public debt as ratios of gross domestic product, the solvency of the public sector itself will be in jeopardy [Butler and Patil 1991]. Thus the twin considerations of growth and sustainability of budget deficits require fairly drastic changes in some of the policies followed so far.

At the macroeconomic level the first and most important objective in the medium run must be a step-up in the overall saving rate which nose-dived from 23.2 per cent to 18.2 per cent between 1978-79 and 1984-85 and then crawled to 21.2 per cent in 1989-90 (*Economic Survey, 1990-91*). Clearly, the public sector has to play an important role in attaining the objective, especially since the decline in the saving rate can largely be attributed to the poor performance of the government in this regard: between 1978-79 and 1989-90 public sector saving as a percentage of gross domestic product registered a fall from 4.6 to 1.7: the performance will appear truly dismal when these rates are viewed in the background of huge public sector investment undertaken since the mid-50s.

But if promotion of saving is the major concern of the government, the focus should not be on the reduction of fiscal deficits.⁶ Public sector saving, let us recall, consists of the revenue surplus of the government plus retained profits of public undertakings,⁷ while fiscal deficits comprise revenue deficits as also deficits on the capital account less recovery of loans and 'other capital receipts'. A reduction in fiscal deficits can

thus go merrily along with a rise in revenue deficits (and a fall in public sector saving) if the government effects a sufficient cut in its investment and lending or sells off part of its financial and physical assets. However, reduction of revenue deficits also figures in the finance minister's agenda for macroeconomic adjustment. But then it is the reduction of revenue deficits and not the fiscal deficits that should have been the cornerstone of macroeconomic management. From the viewpoint of the promotion of saving and growth the focus on fiscal deficits, let us repeat, does not make economic sense unless it is presumed that not only are public investments relatively unproductive, but loans advanced by the government for financing private investment also have an adverse effect on the economy—a presumption rooted more in zealotry than in objective assessment.

It can be argued that though the social marginal productivity of public investment might be high, financing of such investment through borrowings becomes non-viable when its return to the government is significantly less than the interest cost. This is quite an important issue in the Indian context, but it is not clear how far the measures adopted by the government would contribute towards the solvency of the public sector without an avoidable decline in economic growth.

Now the problem of solvency cannot be dissociated from that of economic growth. If government policies promote saving, efficient allocation of resources and hence economic growth, the apprehension regarding the sustainability of public debt would generally be unfounded: 'Take care of growth', it may be argued, 'and solvency will take care of itself'. It is true, public investment with a high yield to the economy promotes growth irrespective of the return realised by the government. However, such growth cannot be maintained if the increase in government revenue proves inadequate to meet interest payments (and other revenue expenditure), i.e. if there is a declining trend in public sector saving. In other words, though the short-run social return on public investments might be high, they can conceivably have a negative impact on the long-run economic growth through a reduction in the saving ratio. It is for this reason that the simplistic application of the social marginal productivity criterion might yield a sub-optimal allocation of investible resources.

It is useful in this context to distinguish between public investments in social or economic infrastructure and those in industrial undertakings. In India the return to the government on the first group of investment is extremely low. However, there is substantial scope for raising the earnings from this category of capital formation where the beneficiaries can be clearly identified, e.g. in the case of higher education, hospital, irrigation or public transport. In many of these instances the beneficiaries belong to the upper income groups and the

Concept

(indirect) subsidies enjoyed by them are many times the combined total of subsidies on the public distribution system and the amount spent on Anti-Poverty Programmes.⁶ Also, the poor yield on public investment is due in no small measure to the inordinate delay in the completion of projects, overmanning and high salary in the public sector compared with that prevailing elsewhere. One looks in vain at the current policy package for any sensible wage-price or other policies which could have contributed substantially towards the generation of a revenue surplus and the promotion of growth with equity.

There are a number of public investments which have large (positive) external effects or which yield public goods. It is not possible in such cases to make the beneficiaries pay for the services provided, but there are indirect returns to the exchequer by way of extra revenues from the additional incomes generated through these investments. Indeed, one can go further and suggest that, even if these indirect returns are negligible as of now, there is nothing wrong in borrowing for purposes of public investment with a high social rate of return. If such borrowings threaten the solvency of the public sector, the malady lies not in these investments or borrowings, but in the failure of the government to make the beneficiaries pay for the services or to devise an effective tax machinery in order to service the public debt. While the huge public investment in roads, electricity and other infrastructural facilities have raised land values many times the increase in the general price level, no step worth mentioning has yet been taken to mop up at least a part of the unearned gains accruing to the private land owners. Such instances of the failure of the tax machinery are legion, but in its obsession for reducing fiscal deficits the ministry of finance seems to have taken the soft option of cutting down the scale of public investment and has failed to initiate the much needed reform in the sphere of taxation and other sources of government revenue. It may also be that the government does not have the will or the ability to make the tax system effective and serve the basic economic objectives.

So far as other forms of investments are concerned, the government, notwithstanding its protestations, seems to have come round to the view that public enterprises are inherently inefficient. It is widely recognised among the researchers in this area that the inefficiency of these enterprises is due primarily to the lack of managerial autonomy and accountability and to the absence of any sensible and quantifiable norm against which their performance can be judged. Though there is some talk of ensuring autonomy with accountability for public sector units, nothing substantive has been done in this regard and the government does not seem to repose much faith in its ability to effect the necessary organisational reforms or to put an end to the political and bureaucratic interference in running these enterprises. Here also the case for scaling

down the size of public sector investment appears to lie not so much in economic logic, but more in the lack of political will or incentive.

An important factor behind the present fiscal crisis is the borrowing policy of the government in the 80s [Rakshit 1987]. During this period interest rates on all categories of government borrowings were raised with substantial tax concessions to boot in quite a few of them. In fact, in some cases the cost to the exchequer by way of interest-cum-tax relief amounts to more than 30 per cent—a rate at which most investment projects would turn non-viable. If the government were serious in promoting saving and solvency of the public sector, all tax concessions on the various saving schemes should have been withdrawn. The cynic would perhaps view the energetic inaction of the government in this regard as quite in keeping with its other omissions and commissions: after all, these concessions are larger for people in the higher income groups and cannot be availed of by more than 99 per cent of households (who do not pay income or the wealth tax).

No less queer is the proposal for disinvestment in shares of public enterprises in order to reduce fiscal deficits. We have already examined why, from the viewpoint of public sector saving or generation of aggregate demand, capital receipts on this count are no different from ordinary borrowings. Nor can the sale of these shares be regarded as an appropriate step for resolving the fiscal crisis. For one thing, the proposed scheme will necessarily be limited to profit-making public enterprises. The steps taken in this connection so far suggest that the prices fixed for the shares will be less than market clearing, i.e. the sale will involve a subsidy to the buyers. Even if the shares are sold through auction or in the open market, for each rupee collected under the scheme the cost will be higher than that under borrowing. The market prices of shares, let us note, are related positively to the prospective earnings from the shares and negatively to the interest cost and subjective risk premium of the buyer. While the faith of the private lender in the ability of the government to service its debt is as yet unwavering, investors in India are notoriously risk-averse in their choice among different financial assets: in spite of the emergence of the so-called equity cult, household savings in shares constitute less than 10 per cent of total financial saving [RBI 1990]. The implication is that government can borrow (if it wants to) at a rate of interest that is much lower than the discount rate (inclusive of risk premium) relevant for the buyer of equities. This together with the current perception of the average investor regarding the prospective profits from public sector investments suggests that disinvestment in shares of profit-making public enterprises is a much costlier way of raising funds than borrowing.

A final point regarding the reliance on private initiative for delivering the goods. This reliance seems to be coupled with the

government's tacit admission that nothing much can be done towards making the fiscal apparatus effective and equitable or towards curbing the growth of black money. The displays almost total nonchalance on the part of the policy-makers regarding the evil consequences of the market mechanism unhindered by any efficient machinery for redistribution and enforcement of laws. These consequences, let us remember, consist in gross distortion in the allocation of resources, in creation of islands of prosperity in the midst of poverty and squalour, and in serious financial crisis for the government. Irrespective of whether we rely on the private or the public enterprises for our economic salvation, there is no substitute for an effective and equitable tax system and an efficient government machinery; but no serious attempt seems to have been made to initiate any policy reform in this crucial sphere.

V

An Overview

There is a general consensus that correction of the current macroimbalances of the Indian economy would require major policy reforms on various fronts. The adjustment process initiated by the government seems to be based on a few key premises, explicit or implicit. First, a reduction in aggregate demand, irrespective of the way it is brought about, contributes towards an improvement in balance of payments and curbs inflationary tendencies in the domestic sector. Second, the key to the aggregate demand management and solvency of the public sector lies in a reduction in fiscal deficits. Third, nothing much can be done to make the tax system effective, to curb the growth of black money or to make the income distribution equitable. Finally, public sector enterprises are beyond redemption and liberalisation is the most effective means of attaining our economic objectives. However, these premises display either an inadequate appreciation of the macrobehaviour of our economy or lack of political will or enterprise to carry through policies that would resolve the fiscal and the balance of payment crisis and promote economic growth without hurting the indigent sections of the community.

No wonder, the overall policy package adopted by the government is not particularly well-designed to tackle the major problems confronting the economy. In fact, some of the measures would in all probability have a deleterious effect on growth, government finances and distribution of income. The most important of these measures are curbs on capital accumulation in the public sector; disinvestment of equity holding in public enterprises; reliance on the issue of debentures for financing investment projects of public undertakings; reduction in fertiliser subsidy and financial liberalisation without any safeguard for ensuring adequate short-run and long-run supply of the basic necessities of life; and the signal given through the provision for whitening black money.

The failure of the new policy initiatives in respect of omissions is much more glaring. No attempt has been made to withdraw the various unnecessary tax concessions under the present system; to appropriate part of the huge gains from public investment accruing to the private sector; to recover the cost of public services enjoyed by the wealthier groups of people even when the beneficiaries can be clearly identified; or to make the public enterprises autonomous and accountable. In the context of the fiscal and the balance of payment crisis an incomes policy for the organised sector in general and the public sector in particular should have been high in any agenda for economic reform; but in the numerous policy statements issued so far the government has maintained an eloquent silence on this crucial issue.

Again, for the resolution of the balance of payments crisis in the short and the medium run, it is necessary to ensure that domestic goods not required for meeting the needs of urgent internal consumption or investment are earmarked for exports. Similar should be the criterion for imports, viz, their contribution towards meeting the domestic needs directly or through promotion of exports. This implies that the levels of domestic taxes (with duty drawback for exports) and of tariffs have to be related with one another and both must be based on the criteria noted above. The policy-makers do not appear to have paid any attention to these principles and failed thereby to initiate steps which could have made a significant contribution towards controlling inflation and reducing the deficit in the balance of payments.

Notes

[Computational assistance from Girish Tiwari is gratefully acknowledged. The author has benefited from discussions with Amaresh Bagchi.]

- 1 The budget papers define the deficits as receipts minus expenditure—a procedure which may cause confusion and error unless one is careful about the signs. Thus in *Budget at a Glance 1991-92* the figure for fiscal deficit is computed correctly, but the two sides of the algebraic relation defining the fiscal deficit are not the same if one uses the usual algebraic rule.
- 2 Thus the implication of a zero primary deficit (with a positive fiscal deficit) is that were there no debt inherited from the past, government borrowing would not have been necessary to finance its expenditure.
- 3 Recovery of loans less new loans given.
- 4 Assuming that the modified Marshall-Lerner condition is satisfied.
- 5 With appropriate changes in respect of the policy regarding foreign borrowings and their utilisation.
- 6 Gulati (1991) also makes the same point.
- 7 So that *ceteris paribus* higher dividends from these enterprises raise the revenue surplus, reduce fiscal deficits, but does not affect the level of public sector saving.
- 8 Mundle and Rao (1991) estimate that the unrecovered cost to the government in providing economic and social services is to the tune of 16 per cent of gross domestic product.

Now! You can buy **GOLD** with your eyes closed!

STANDARD GOLD from Hutti Gold Mines
With the Government Seal of Quality

Until recently, you had no authentic source of pure gold: you had to rely solely on the word of the jeweller. Today, happily, things are different!

A GOLDEN OPPORTUNITY

For the first time in India, you can now buy genuine 24 carat gold in mint condition, at the prevailing market rates. Available in 10g, 50g and 100g bars, Hutti Gold will be sold directly across the counter, at select branches of the State Bank of India.

CERTIFIED BY THE GOVERNMENT

With Hutti Gold you take no chances! The weight and purity of every bar of Hutti Gold is guaranteed, by the Government. And constitutes a wise investment, being easily convertible at any place, any time.

THE GIFT IDEA BEYOND COMPARE

Hutti Gold makes a unique gift for weddings, birthdays, anniversaries and other festive occasions. It is the gift of royalty, and makes an ideal present for someone very special.

GLITTERING MASTERPIECES

With the gold you buy from us, you can fashion dream creations in jewellery. It's surprising what you can get out of a single bar of gold! Exquisite, ornamental works of art—delicate, filigreed or chunky.

HUTTI, THE NO. 1 GOLD MINES IN INDIA

The Hutti Gold Mine is one of the most ancient metal mines in the world, and tracks time back to Ashokan times.

During the Post Independence period alone, gold valued at over Rs. 1000 crores has been mined here. A national asset, the Hutti Gold Mine is poised to further tap the country's abundant wealth, contributing substantially to State and Central Revenues.

WHERE TO STRIKE GOLD

Hutti Gold is available at the appointed branches of the State Bank of India given below. Come, join the gold rush!

New Policy Measures

D T Lakdawala

The budget for 1991-92 by itself, if stuck to, will prove less inflationary than last year's but it has to be taken along with the impact of devaluation, the need to increase the export quantum, the pressure of increased costs on the prices of products, the likely increase in procurement prices of foodgrains, the lag effects of past inflationary pressures and the impact of the weaker monsoon

IN response to the crisis situation in the foreign exchange sector and the apprehension of slowing down of economic growth, the government of India has taken several far-reaching measures on the foreign trade, exchange, investment, fiscal, monetary and industrial fronts. These are expected to have a powerful impact on the Indian economy. The new steps in many ways constitute radical departures from the policies followed hitherto. Questions, therefore, naturally arise about their legitimacy and efficacy. It is proposed to discuss them here very briefly without going into the details of these policies.

In this discussion it is best to primarily concentrate on Indian interests and Indian experience, and treat others' views and happenings in other countries as of secondary importance. The Indian experience was that (a) India had reached a stage where imports were restricted to a level where any further substantial lowering could not be resorted to without endangering the growth rate, (b) increase in foreign exchange earnings through increased exports was the only long term way of financing the needed imports, (c) Indian exports were hampered by uncertainty of supplies, high costs of inputs, low quality, and lack of attention to customers' needs, these could be remedied by a non-inflationary situation, inflow of higher technology, greater competitiveness in the Indian and world markets, compensation of export risks by selectively greater profitability and expertise in salesmanship, (d) since increasing export receipts to catch up with import payments would take time, net capital receipts will have to form the residue, (e) credibility was the crucial point in credit transactions and strong reserves were needed to maintain credibility, (f) the main responsibility for Indian inflation lay on the budgetary deficits which resulted in the issue of high powered money, borrowing for revenue needs did not result in the creation of assets, so that assets which broadly matched liabilities till 1981-82, formed only 76 per cent of liabilities by 1990-91, many of the assets were not financially productive, so that interest received from assets formed only 44 per cent of the interest paid on liabilities, interest (gross) on public debt became the most important single item in non-plan expenditure, (g) the state could not harness adequate resources to finance the economic infrastructure which it had undertaken to build and the public sector undertakings which were entrusted with the responsibility of managing it had no other means to raise substantial sums, and (h) the

extreme rigidity of the control mechanism and the partiality, corruption, bribery and inefficiency which accompanied it had aroused all round resentment among the people who desired it to be done away with. This sentiment had persisted since the middle of the 70s. The control mechanism which had been introduced to achieve desired ends had to be replaced by more effective general rules and regulations and fiscal and monetary methods which left little to discretion.

FISCAL BALANCE

The main lesson underlining our long experience is the need for fiscal balance. It is best, therefore, to begin by seeing how the 1991-92 budget scores in this respect. Having analysed it in some detail elsewhere, I may only refer here to its broad impact. The 1991-92 budget estimates visualise an absolute reduction in non-plan expenditure (excluding interest on public debt where there is little scope for reduction) of Rs 2,700 crore. The rise in total non-plan expenditure increase is less than 4 per cent and will be less than 5 per cent even if it is assumed that the fertiliser subsidy adjustment announced later will be entirely uncompensated. As percentage of GDP non-plan expenditure will decline from 14.9 per cent in 1990-91 to 13.9 per cent in 1991-92. In view of the grave resource crunch budgetary plan expenditures will only increase by 12.6 per cent, the states getting a larger increase, increased extra budgetary resources (including loans raised by PSU from the public) will raise the increase in total central plan expenditure from 8.1 per cent to 12.9 per cent. Additional tax measures will fetch Rs 2,617 crore of which 82 per cent will come from direct taxes and yet there will be a decrease in the ratio of revenue from direct taxes to total tax revenues. As in the past, a large proportion

of the additional expenditure in 1991-92 will be on revenue account (62.4 per cent) rather than on capital account and non-plan expenditure will claim a larger share (81.4 per cent) than plan expenditure (Table 1). An out of the way item as capital receipts is Rs 2,500 crore by the disinvestment of shares of selected public sector undertakings upto 20 per cent to investment institutions and mutual funds. The most comforting feature of the budget is that the revenue deficit, the fiscal deficit and the budgetary deficit are all absolutely lower than in 1990-91 and as a proportion of GDP (Table 2). The achievement sounds much more imposing when considered against the background of the deficit that appeared likely in early July and considering that the task had to be done in eight months instead of 12. A caution needs to be, however, sounded that since 1989-90 the revised deficits and actual deficits which are of much greater importance are much larger than the budgetary ones (Table 3) and Manmohan Singh will have to strain his utmost to see that there is no repetition of these performances.

We had double-digit inflation last year, and there is a great apprehension that the event may repeat itself. The budget by itself if stuck to will prove less inflationary than last year's, but it has to be taken along with the impact of devaluation, the need to increase the export quantum, the pressure of increased costs on the prices of products to break even, the likely increase in procurement prices of foodgrains, the lag effects of past inflationary pressures and the impact of the weaker monsoon. It will be a miracle if the wholesale price increase does not exceed 10 per cent, and it may be much more.

Black money has assumed such a large dimension that no finance minister can afford to ignore it. The tragedy is that in his eagerness to deal with this phenomenon he has to offer to deal more leniently with it.

TABLE 1. DISTRIBUTION OF ADDITIONAL EXPENDITURE IN 1991-92

| | (Rs crore) | | |
|------------------------------------|------------|----------|--------|
| | Plan | Non Plan | Total |
| Revenue expenditure | 2,769 | 8,181 | 10,950 |
| | | | (62.4) |
| Capital and loan | 490 | 6,114 | 6,604 |
| | | | (37.6) |
| | 3,259 | 14,295 | 17,554 |
| | (18.6) | (81.4) | (100) |
| states' share of total tax revenue | | | 1,830 |
| | | | 19,384 |

Note: Figures in parentheses are percentages of total additional expenditure.

than with incomes honestly declared. The 1991 scheme provides that deposit made with the National Housing Bank on or before November 30, 1991 will enjoy complete immunity from enquiry and investigation. 60 per cent of the deposit can be drawn by the depositor for any stated purpose of his choice, 40 per cent will be a special levy and will form the corpus of a fund in the National Housing Bank. The scheme is likely to be a non-starter as the first prerequisite for success, a great likelihood of being caught and deterrently punished for tax evasion does not exist. The tax evader will not easily believe that this is his last opportunity to come clean. Even more important he has been offered by the budget itself cheaper ways though transferring amounts illicitly abroad and getting them back as gift.

INTERNATIONAL ECONOMIC POLICY

Unlike fiscal policy where the need to drastically reduce the revenue, budgetary and fiscal deficits mainly through a reduction in non-plan expenditure and partly through additional resource mobilisation was almost universally recognised, in international economic policy there was no similar unanimity. The trade deficit had no doubt to be narrowed mainly through export increase but whether a sharp devaluation dose, which would raise many problems of adjustment, was really necessary will remain debatable. The Reserve Bank of India had been adjusting the foreign exchange value of the rupee from time to time (in the 80s the rate of the dollar had gone up by about 10 per cent every year) and along with the other export promotion measures this had helped in increasing dollar receipt from exports in the Seventh Plan period by 87 per cent. In 1990-91 export expansion had slowed down, but it was an exceptional year, and other adjustments including price stability and a smaller decline in exchange rate could have helped. The only valid argument for a sharp decline in the foreign value of the rupee was a growing belief among the traders that the rupee will depreciate and therefore their unwillingness to convert their foreign exchange claims in rupees and vice versa. With the low foreign exchange reserves that India had, and nobody willing to lend foreign exchange, there was no other course left except a large devaluation. This sort of logic has the dangerous implication that if similar expectations occur in future, there will be another sharp dose of devaluation, unless we have accumulated large foreign exchange reserves in the meantime or somebody is willing to lend substantial sums. One thought that was the function of the IMF, but the suspicion is that it played quite the contrary role.

The traditional role of devaluation is to increase export receipts and restrict import payments, but in an exchange control regime the latter role becomes insignificant and the major burden of market adjustment falls on

exports. As a result of devaluation the supply of Indian exports in foreign exchange prices increases so that the quantum of exports will increase, but whether the export receipts increase will depend on the elasticity of demand for exports. If the demand is elastic (Indian exports are only 0.56 per cent of world exports so that on this ground alone demand for Indian exports may be expected to be elastic); the extent of increase in foreign exchange receipts will be determined by the elasticity of supply. Domestic demand, inflation, cost increases with increasing supplies and export infrastructure can prove limiting factors and removal of these limitations takes time. The hope that the import quantum will be immediately increased after devaluation facilitating the growth process will not be realised. The composition of imports can be changed depending on the government's decision of how much of the allocation it decides on its judgment of priorities and how much it leaves to the market mechanism. The Indian government seems to have decided that 60-70 per cent of the foreign exchange should be directly allocated by it and 30-40 per cent can be left to the market mechanism. The exports are given easily marketable replenishment licences worth 30-40 per cent of exports, and with certain exceptions like jewellery, small industry, etc, the import needs of production have to be met from them. These are also assumed to adequately compensate for the cash compensation certificates that have now been abolished. In three years all licences for capital goods and raw materials

will go, but there will still be a negative list and non-essential consumption goods will not be allowed. It seems that for a number of years the market in foreign exchange will be limited and imports on government account will get preference. Revenue and protective duties will continue, the only concession to the demand for lowering tariffs being the reduction of maximum customs duties to 150 per cent.

FOREIGN CAPITAL

Foreign capital policy can be considered as an integral part of both international economic policy and of industrial policy, and on both the counts government policy shows a significant change in thinking. If Indian products are to be exportable, they must be able to compete with world products in prices, quality and design, and for that they must get easy access to foreign technology and foreign expertise. These are provided for Indian industry in the new policy but to get these uninhibitedly they must be allowed to be accompanied by foreign equity capital. India has drawn heavily on the aid available from international bodies, foreign consortia and individual nations, and these avenues have been exhausted. With the recent developments in eastern Europe and USSR, it is unlikely that a larger flow of aid or loans can be obtained. The possibility of better foreign balancing will depend on higher equity capital flow. The restrictions on foreign equity capital have therefore been greatly lessened.

NEW ARRIVAL

A Reader in Urban Sociology

M.S.A. Rao,

C. Bhat, Reader, Department of Sociology,
University of Hyderabad.

L.M. Kadekar, Lecturer, Department of Sociology,
University of Hyderabad.

The book brings together significant sociological studies by eminent foreign and Indian sociologists. The studies reflect the phenomenal developments in the field of urban sociology in India since the late sixties, taking into account recent research wherever possible.

Important areas have been discussed – development and changes in the village organisation, caste identity, politics, traditional institutions, etc. An important source book for students and scholars of sociology.

Hardback Rs. 175.00

Paperback Rs. 110.00

Orient Longman

Two general laws that were hitherto followed are: (a) foreign capital was only welcome if it was accompanied with high technology; (b) in order that it may be treated like an Indian company, foreign participation should be ordinarily restricted to 40 per cent. Now, foreign capital is welcome in itself and in high priority industries its share will be permitted up to 51 per cent. The 34 high priority industries which are listed are almost the same as those earlier open to the MRTP/FERA companies. It has been realised that multinationals of the desired type are not always willing to apply for permission to enter the selected industries. So a special Empowered Board, unhampered by any routine roles, will be set up to negotiate with them.

INDUSTRIAL POLICY

The abolition of the concept of big houses and dominant undertakings is a more controversial step. While the long, time-consuming inquiries that were made before deciding on their proposals were legitimately objected to, one of the underlying ideas that big industry should concentrate its energy on pursuits suited to its competence and strength was a fertile one and needed to be further examined before being discarded.

While the commanding role of public sector in Indian industrialisation and economic development is gratefully acknowledged, there is a general feeling that it has spread its tentacles too wide and undertaken tasks which the private sector driven by the profit motive can better perform. Not only has it a poor financial record, even its service record is unsatisfactory in certain lines. In terms of venturesomeness and risk-taking capacity as well as ability to look ahead the private sector has gained considerably in the last few years. In the light of the experience gathered and the grave resources crunch, only eight areas are reserved for the public sector. Wider public participation will be encouraged in the other fields. BIFR or a

similar high powered body will be asked to formulate revival or rehabilitation schemes for chronically sick public undertakings.

The power industry in a way illustrates the difficulties with which the working out of this division of labour bristles. For a long time the central government has been trying to ask the private sector to participate in the generation of power, the construction of roads, etc. But the success of power generation depends on the efficiency of the distribution machinery. If the distribution machinery is hard of cash and defaults in meeting its obligations of payment for power purchases, the activity of power generation cannot be successfully carried on. Much of the finances needed for power generation must come from public financial institutions. The private sector is only interested in certain aspects of these areas—heavy traffic roads, urban electrification, etc. and will not like to compete in activities where the public sector is subsidised and there are no prospects of a fair return. These difficulties will have to be smoothened out if the division is to work.

In the power sector to set up power plants in the country 100 per cent foreign equity participation will be permitted. The Reserve Bank of India has been asked to ensure that over a period of time the dividend outflows do not exceed export earnings. The FERA firms will have a distinct advantage at present over Indian firms if the foreign equity covers the cost of imported capital goods as the latter's access to import of capital goods will be limited, but this advantage is important in the effort to get the maximum foreign exchange and will hopefully disappear in a short period.

The change in attitude to foreign capital is based on the assumption that the need for capital investment and enterprise is large and of a nature which can only be partially satisfied by Indian capital, and that by and large the competing fields are few and those where competition will lead to increased efficiency of many. These assumptions need

to be tested, but two things are fairly obvious. When pushed to the wall, given equal terms, Indian capital and entrepreneurship are capable of a good show in India compared with foreign capital over a wide field. While the Indian market is a large attractive market for foreign capital and offers favourable production facilities, many of the economic and social conditions and legislation yet look unfamiliar and unattractive to them, and they may have many questions to ask and difficulties to solve before they take a plunge and that will give time to Indian capital to shed many of its weaknesses.

The most important qualitative transformation sought in the industrial structure is doing away with the industrial licensing system except for a small list of 18 industries. This was the only possible response to the general feeling of resentment and disgust at the consequences of detailed control on the starting, expansion and location of a firm. In the regulation of economic activity, individual discretion case by case decisions had to be abolished. There were, however, spheres which could not be left to the market place. In these licensing will still be essential. The list includes entertainment electronics and white goods. The rest of the industries can now be located anywhere except in cities with populations of more than a million. They will have access to all the production facilities including imports of raw materials, spares, etc. from April 1991. The only major exception will be capital goods imports, to which the free access will be limited to 25 per cent of the value of machinery and equipment up to a maximum of Rs 2 crore. Reservation for small industries and special arrangements for them will continue. The delicensing of most of the industries will lend dynamism to the relatively stagnant industrial scene.

HIGH HOPES OF SUCCESS

High hopes are entertained for the success of the new policy. The reactions of various industrialists and entrepreneurs and announcements of the finance minister in his budget speech (regarding the level of direct taxation, customs duties, future interest rate) sound very optimistic on the future prospects. Seeing the malaise in which the country is placed and the causes, the general policy measures adopted seem correct. We have to get out of the framework of rigid detailed control mechanisms to which we were subject and recent measures have been in that direction. At the same time there is no wholesale acceptance in the new measures of the working of the market mechanism. It is not possible to provide against each and every likely adverse consequence of the new dispensation. Such detailed action will leave ample scope for error, favouritism and corruption. There can only be general rules, a list of exceptions, a negative list, fiscal and monetary incentives and disincentives, and these have been provided for, and more when

TABLE 2: REVENUE DEFICIT, BUDGETARY DEFICIT AND FISCAL DEFICIT

| | 1990-91 (RE) | Per Cent of GDP | 1991-92 (BE) | Per Cent of GDP |

| 1991-92 | 7,719 | — | | | |

necessary can be fitted in.

The decisions now taken need a follow-up in several cases. The process of economising, of reducing waste and inefficiency in the fiscal machinery, of reducing subsidies except to the poorest, of increasing the foreign exchange availability for private imports so that capital goods can be freely imported without the multiple exchange rate mechanism will take time and will demand vigorous pursuit with a great degree of determination. Increasing the efficiency of the production mechanism will necessitate many measures in other fields like an exit policy, transformation of attitude to work and management, etc.

The remaining period of 1991-92 and a large part of the year 1992-93 are likely to be a difficult period for Indian economy as it will pass from a partially controlled economy to a largely market-determined economy. The change visualised is nowhere near that in eastern Europe which had more highly controlled economies and wish to evolve into free market economies but the transition will be marked by some pain and anguish. Many firms will fall sick and be liquidated, and labour so discharged may not get easy alternative avenues of employment. It will be a legitimate demand on the society that the problem of unemployment is at least not aggravated and ample retraining and resettlement facilities are provided. A fast narrowing of the export-import gap implies a likely decline in the terms of trade and in the absence of fast economic growth this presumes a drawal on per capita consumption or savings. If this burden can be shared equitably and understandingly it can be borne without upsetting the society. But there are no evident preparations for explaining the detailed implications of the policies or for equitable sharing. There is somehow hope that the IMF and World Bank will understand our difficulties and agree to help liberally so that the transitional difficulties are lessened.

Frankly, a lot of our optimism rests on faith in the IMF and World Bank. Since India has never defaulted on its obligations, and the Indian problems of price rise, unproductive public debt and foreign dependence are smaller than in many developing areas, the IMF may give large loans. With these the temporary transitional difficulties will be greatly lessened. The stumbling bloc is the IMF conditionalities all of which we cannot stomach. Regarding some of them like fiscal stabilisation, limit to money supply increase and even realistic exchange rates there are no serious objections but with the wholesale acceptance of conditions like privatisation, market dominance, free trade, etc, the country will hardly agree. We hope an acceptable and feasible *via media* will be found.

A second hope is the large foreign exchange held abroad by Indians and NRIs. If this can flow to India in large sums, it will immediately alleviate the foreign exchange difficulties. The exemption of all gifts from

remittances in foreign exchange from gifts taxation (with no inquiry regarding the sources of funds) and the permission to the resident donees to hold State Bank of India's India Development Bonds denominated in dollars without income and wealth tax with the final redemption in rupees at the current rate of exchange may serve as a powerful inducement to black money holders to convert their rupees by hawala transactions in dollars. This will be a relatively cheap way of transferring black money into white, the inducement being greater investment opportunities opened by liberalisation and the promises of lighter taxation made by the finance

minister. Unlike the IMF loan there will be no question of repaying in foreign exchange.

A caveat may be sounded here. The new policies have no features which will deal with some of our major problems like poverty, employment, regional inequality, etc. This is not a serious defect if these policies do not constitute the whole plan which will have other policies and programmes to deal with them. Fiscal, monetary and other regulatory methods will be available to deal with the problems. It will however be a serious lacuna if in the enthusiasm for new policies these persisting problems are forgotten and planning given a go by.

It's just the beginning

A net profit of Rs 1.10 Crores, reserves Rs 1.02 Crores, net worth of Rs 4.53 Crores and a declared dividend of 18% APL in the first nine months

No wonder it is considered the fastest growing in the industry

That's Fairgrowth Financial Services Ltd. flagship company of the Fairgrowth Group promoted by Mr. B. Ratnakar, former chairman of Canara Bank

On the Crisis and the Remedies

Pulin B Nayak

It is difficult to be enthusiastic about the recent package of economic policy measures which will be highly inflationary and will slow down investment in economic and social infrastructure. Additionally, it is going to hurt the poor via cuts in schemes like the rural employment generation programme.

In the fiscal sphere, pace the budget for 1991-92, the larger issues still remain to be addressed. The tax system needs to be restructured. The overwhelming reliance on indirect taxes has to be reduced and the base of personal income tax has to be widened. Simultaneously, there has to be the political will to take stern measures against tax evaders and operators in the parallel economy. And, above all, there has to be a determined effort to curb wasteful current expenditure, and not capital expenditure on social and economic infrastructure. This is a rather daunting agenda, but a beginning has to be made.

THE new Congress(I) minority government headed by P V Narasimha Rao has gone about introducing significant changes in economic policy with breathtaking rapidity. On July 1 and 3 the rupee was devalued by about 20 per cent in two discrete steps. This was followed by major reforms in trade policy so that Indian trade and industry may "soar in the high skies of trade", and the rupee may become fully convertible in three to five years. Twenty days later the industrial policy was drastically liberalised as the asset limit for MRTP firms and industrial licensing for most projects were abolished and the limit of foreign equity was increased to 51 per cent in several 'high priority' areas. The industrial policy was announced the same day as the union budget was presented in the parliament. The budget itself incorporated several pointers of change in economic thinking. All of this was going on in a setting where India was facing a severe balance of payments crunch and was at the doorsteps of the IMF, trying to negotiate a substantial structural adjustment loan of some \$5 to \$7 billion, complete with the conditionally clauses.

It is now widely agreed that the Indian economy is currently undergoing a severe crisis. The crisis is possibly the severest that the country has had to face in the post-independence era. The fiscal sector of the economy is possibly in the throes of its most stringent test ever. The foreign trade sector of the economy has been in great trouble despite periodic claims from official sources in the past three to four years that exports have been going up by leaps and bounds. In the fiscal sector government expenditure has been far outpacing revenues in the current account for more than a decade now, leading the government to resort to substantial borrowings, both internal and external. The national debt has now reached such a level that interest payments constitute the largest single expenditure head of the central government budget. Non-essential expenditure continues to grow unabated, the explanation for which cannot be confined to strictly economic factors. The prospects for making substantial inroads into the pockets of the potential income tax paying public appear to be circumscribed, due, mainly, to a lack of political will, and also partly due to certain

formidable administrative problems. The tax to GDP ratio is already reasonably high and the prospect of having it increased further appears to be limited, at least in the short run.

In the foreign trade sector, imports have systematically outpaced exports in the post-independence phase with the exception of two years in the 70s. If then we are having to face the BoP crisis of the magnitude we have today it should really be no surprise, for it has in any case been a long time coming. The problem was no doubt exacerbated by the liberalisation drive of the 80s. During this phase imports went up quite sharply while exports themselves increasing at a moderate pace did not quite keep in step with imports. The magnitude of the trade gap grew particularly large during the past decade, with the deficit hitting a peak of Rs 10,644 crore in 1990-91. The foreign exchange reserves reached a low in mid January 1991 when the country had barely enough funds to finance 10 days' import requirements. In desperate straits, the country went in for a loan of \$1.8 billion from the IMF under its CCF facility. But as was clear from the beginning, this was at best only a temporary respite and the drain on the country's reserves continued unabated. The problem was particularly aggravated by a drying up of remittances from Indian nationals living abroad. In a bid to contain this trend the RBI imposed strict import restrictions by substantially hiking up cash margins. This eased the rate of foreign exchange outgo somewhat, throwing up a small surplus in trade balance in April. This process was however not allowed to work itself through as there was a significant change in trade policy in early July that went in the direction of linking virtually all non-bulk imports to exports via the instrumentality of the replenishment (REP) licensing scheme, and subsequently, a lowering of import duties.

For the economic policy makers in the new regime it was a foregone conclusion that India ought to seek a substantial structural adjustment loan of \$5 to \$7 billion from the IMF to tide over the current crisis. The conditionalities for such a loan have been well known, and include devaluing the currency, liberalising the foreign trade sec-

tor, effecting cuts in subsidies, and initiating a process of privatisation, among others. We have already been more than accommodative in not only conceding to, but indeed adopting, virtually each one of the conditionality requirements, with scant regard for the demonstrably harmful effects of some of these for the economy at large, and for the poor in particular. Yet there has been a tide of support for the IMF dictated path of adjustment among the media, academics and other professionals that has been seldom witnessed before. Emboldened by the support of this influential group, the government has gone about implementing a broad package of reform measures to give the right signals to the IMF and initiate a process of liberalising and globalising the Indian economy. It would be a matter of interest to see the extent to which these measures achieve their desired results.

ECONOMIC BACKDROP

As per the pre-budget *Economic Survey 1990-91*, the past year's performance of the real sectors of the Indian economy was not too bad. The GDP growth rate was expected to be about 5 per cent. The growth rates of agricultural and industrial production were expected to be 4.5 and 8.4 per cent respectively. During the Seventh Plan period GDP grew at an average annual growth rate of 5.5 per cent and agriculture and industry grew at average rates of about 4.1 and 8.5 per cent respectively. Yet the fact that all was not well with the economy was attested to by the rather substantial inflation rate of 13.6 per cent in 1990-91 measured in terms of the consumer price index. This was fuelled to some extent by the sharp hike in the price of oil on account of the Gulf crisis but there were other deeper, and more disturbing, trends at work.

Without a doubt, the roots of the current crisis are to be located in the severe fiscal and trade imbalances that have been evident in the economy in recent years. If one were to focus attention on the central government budget, it is seen immediately that especially over the past decade the revenue account has systematically been showing a deficit (Table 1). Through the three decades of the post-independence period till the late 70s,

the revenue account of the centre, except for two years, always showed a surplus, though admittedly of a modest magnitude. It is in 1979-80 that a decisive break came, from when there has regularly been a deficit. Starting at 0.61 per cent of GDP in 1979-80, the deficit has steadily grown to 3.4 per cent of GDP as in 1990-91. This has meant that the centre has had to repeatedly borrow in the capital market to provide for current expenditure that yields no return. This has also meant that the public debt and other liabilities of the government has burgeoned substantially (Table 2), amounting to well over 60 per cent of GDP. One immediate consequence of this is that interest liabilities have moved up appreciably. Indeed they constitute the largest single expenditure head of the central government and in the coming year are budgeted to be around Rs 35,000 crore. For 1990-91 gross interest payments formed 21.4 per cent of total expenditure of the central government, up from 11.6 per

cent in 1980-81.

This very naturally raises the question regarding the sustainability of the debt. If government borrowing goes on unabated it would sooner or later raise the question regarding the very viability of the system especially if a government has to borrow or step up the tax effort merely to repay past debts rather than spend the money for developmental purposes. The government then ultimately has to severely curb the rate of growth on non-essential expenditure, while trying to step up, or at least keep intact, the allocation for capital expenditure. Over the past decade the trends have been precisely otherwise. A perusal of the *Economic Survey* (pp 109-110) reveals that gross capital formation out of budgetary resources, which comprised 40.1 per cent of total expenditure in 1980-81, had steadily gone down to 32.7 per cent by 1990-91. Two other features need to be mentioned in this context. First, gross capital formation out of budgetary resources, which grew at an average rate of around 18.8 per cent in the early 80s, appears to have started decelerating from 1986-87. Secondly, and more ominously, the rate of increase in gross capital formation turned negative (-1.4 per cent) for the first time in 1990-91. In the meantime the gross savings of the government had turned negative for the first time in 1984-85, and the dissaving has been growing over the years, amounting to nearly 1.5 per cent of GDP in 1990-91.

All of the trends noted above have been the wages of a soft state where government expenditures have bloated way out of proportion to tax and non-tax revenues. The bureaucracy has grown, so have its myriad perks, and there has been mindless profligacy in sundry projects ranging from the Asiad and the Festivals of India to the loan 'melas' and the loan waivers. Faced with a resource crunch, when budgetary allocations have had to be trimmed, it has invariably been capital expenditure that has had to be axed, while revenue expenditure has gone on expanding. Powerful vested interests have emerged to keep the fiscal economy running in this manner.

The implications of the above trends on the monetary sector are immediate. Along with the large revenue deficits, the central government has had large budget deficits,

averaging about 2.1 per cent of GDP during the Seventh Plan Period. This in turn has contributed to a large monetised deficit which is the total of the net increase in the holdings of treasury bills by the RBI and its contribution to the market borrowings of the government. It is this which determines the growth of money supply. During 1990-91 the monetised deficit was expected to be about 3 per cent of GDP, and for the seventh plan period as a whole it averaged around 2.3 per cent of GDP. Money supply grew at an average annual rate of about 17 per cent during the first four years of the Seventh Plan and went up by as much as 19.7 per cent during the final year of the plan, causing a substantial liquidity overhang in the economy. This contributed in a large measure to the double digit—13.6 per cent increase in the consumer price index—inflation that the economy went through during 1990-91.

In the realm of tax revenue, the tax to GDP ratio has moved up in the past four decades from about 6.69 per cent in 1950-51 to about 17.4 per cent in 1990-91. For a country of India's level of development the tax to GDP ratio is certainly quite reasonable. This is not to say that the rate cannot be further stepped up nor, more importantly, that the tax system cannot be significantly restructured. A major problem with the tax system is that the share of direct taxes has virtually stagnated during the period; it started out at 2.47 per cent of GDP in 1950-51 but after touching 3.26 per cent in 1963-64 it had gone down to 2.49 per cent of GDP in 1988-89 (Table 3). Thus the entire increase in the tax to GDP ratio has been brought about by exploiting indirect taxes. Within direct taxes, the decline in importance of personal income taxes has been even more dramatic: these taxes comprised some 21 per cent of all tax revenues in 1950-51 and are now down to about 5 per cent of the same.

Now, it is well recognised that personal income taxes have the advantage that they can be tailored to meet individual circumstances. They can be employed to promote equity directly in a manner that indirect taxes such as excises cannot. It is therefore important to explore avenues of enlarging the scope of personal income taxes by expanding their base. Currently the total number of income tax assesses constitutes well under a percentage point of the population. Perhaps the most important task facing policy-makers is to bring all potential income tax assesses into the tax net. This task is rendered difficult by the presence of a substantial parallel economy, the income originating in which is beyond the purview of income taxation, and the existence of large numbers of small traders and self-employed professionals—the so-called 'hard to tax' groups—who ought to be in the income tax net but are not. Finally, the significant numbers of deductions and exemptions that have been allowed in the definition of taxable income from time to

time have contributed to a narrowing of the base of income tax. These gaps need to be examined afresh and closed where necessary. It need hardly be stressed that there is substantial evasion and avoidance of income tax and the enforcement mechanism has to be tightened to firmly deal with the problem.

While indirect taxes continue to be the mainstay of the tax system, comprising as much as nearly 85 per cent of all tax revenues, there is little to suggest that there is in fact any well defined rationale in raising revenues on this score. These taxes have usually been raised on the basis of *ad hoc* considerations and administrative ease. Almost 70 per cent of the revenue from excise duties are realised from inputs and intermediates. There is also an incredible multiplicity in the rates of tax. Both these factors make for a lack of transparency in the incidence of these taxes and their economic effects. While a system of modified value added tax, introduced in 1986, has been instrumental in imparting a certain rationale to the excise tax system, its coverage is partial, and the overall impact of excise taxes is one of escalation of industrial costs via the cascading effect. Further, the inefficiencies of the union excise are accentuated by the sales tax and other indirect taxes like octroi levied at the state level and there is urgent need for tax harmonisation at different levels of government.

A very important question pertains to the equity of the tax system as a whole. The available evidence suggests that the incidence of indirect taxes in India is mildly progressive. It is acknowledged, however, that indirect taxes tend to be regressive with respect to income, and one has to devise a very complicated structure of rates and exemptions to impart a measure of progressivity to the system. Such a complicated rate structure however results in inefficiencies, higher administrative costs and revenue losses. As for direct taxes, while the statutory incidence of the tax on income tax assesses already in the records of the CBDT is no doubt progressive, little can be said about the progressivity of the tax if one were to account for the large extent of tax evasion and the generation of incomes in the parallel economy. In order to ensure equity in the tax system as a whole, the share of direct taxes has to be increased, the base of per-

sonal income tax has to be widened, and enforcement has to be tightened to check tax evasion and curb the generation of black incomes.

The Long Term Fiscal Policy (LTFP) document 1985, had noted that the alleviation of poverty is at the centre of our five-year plans, and that in order to help achieve this objective fiscal policy has to play a critical role by mobilising additional resources which may be used for financing anti-poverty programmes, for improving the social and economic services on which the poor mainly rely, and for financing the heavy investments in infrastructure which are necessary for sustaining growth in

agriculture and industry. Fiscal policy may also be used as a tool to expand productive employment opportunities and it can play an important role in keeping inflation within moderate bounds. The last objective is particularly important because inflation causes economic hardships to the poor and the vast majority of the population in the unorganised sector whose earnings are not indexed.

About a third of India's population still lives in abject and degrading poverty. During the 80s, while GDP recorded a growth rate of around 5.5 per cent, the growth rate of employment was in the range of a meagre 1.5 per cent. Employment in the organised sector, which grew rapidly at around 5.1 per

KSFC Your Best Guide to Industrial Opportunities in Karnataka

Karnataka is today in the forefront of the industrial revolution that's fast changing the face of India. Blessed with sensible industrial policies, a vast pool of highly qualified personnel, an enlightened labour force and excellent transportation and communication facilities, Karnataka is the first choice location of most new industrial ventures. Bangalore, the capital of Karnataka, is already the undisputed electronics capital of India accounting for a lion's share of the country's electronics production. Any business venture in Karnataka is a profitable proposition today. And making it more so is KSFC—Karnataka State Financial Corporation, India's frontline SFC with sanctions of well over Rs. 250 crore and disbursements totalling nearly Rs. 191 crore in 1990-91.

Whether you're a technocrat wishing to set up an industry or a doctor wishing to open a specialty clinic—whether you wish to build a hospital or a hotel—whether you want to go in for the seafoods business, agro-industry or small scale industry—KSFC will finance you. And finance you handsomely on the most attractive terms. KSFC's assistance extends to all bankable and viable projects—to ventures as diverse as processed foods, mining, power generation industrial estates, hospitals, hotels, research & development establishments, and many many more. KSFC offers long-term loans and soft loans (contribution to promoter's capital) at much lower rates of interest and longer repayment and moratorium periods, with minimum security margins. The loans are available under various schemes like Seed Capital Scheme, Special Capital Scheme, Composite Loan Scheme, Hotel Industry Scheme, Technicians Scheme, Modernisation Scheme, Equipment Finance Scheme, Electro-medical Equipment Scheme, Hospital/Nursing Home Scheme, Single Window Scheme, Tourism Scheme, Mahila Udyam Nidhi Scheme, Rural Industrial Scheme and more.

There are special incentives for projects promoted by technician-entrepreneurs in small scale sector, and for units located in the notified industrially backward districts of the state. KSFC also gives special preference to projects with high employment and less power consumption—ventures that are capable of utilising local resources and those that are in tune with the declared national priorities.

Karnataka, the land of industrial opportunity is beckoning you. Come share in Karnataka's Prosperity. Let KSFC show you how.

cent per annum in the early 1960s, rose at around 2.4 per cent per annum during 1977-83 and at 1.4 per cent during 1983-88, denoting steady deceleration. During 1983-88 employment in the private organised sector has declined somewhat. As regards the price level, we have already noted that the economy has lately been in the throes of a double digit inflation. Thus the contribution of fiscal policy as regards the above objectives has not been strikingly notable in recent years.

As regards the external sector, India's balance of trade has been under very severe strain in the last five years in particular, leading to a dwindling of our foreign exchange reserves and a burgeoning of our external debt. A number of factors were identified by the report of the Economic Advisory Council to have been responsible for precipitating the problem. Among them were (i) the more liberalised import-export policy during 1985-88, (ii) levelling off of workers' remittances from abroad, (iii) plateauing of indigenous oil production in the face of continually rising domestic demand for petroleum, and (iv) the possibility of a growing import intensity of exports. To this must be added the increase in import intensity of manufactured consumer goods that have catered to the fancies of the top 10 per cent of the population. Indeed the strategy of trade liberalisation has been the basis of sustaining the new manufactured consumer goods boom of the late 80s. The liberalisation measures came in the form of removal of import restrictions or reduction in tariffs and applied to components, intermediates and capital goods. A look at the import statistics reveals that the sharpest increase in India's import bill in recent years has been accounted for by the item entitled 'capital goods', which increased from Rs 1,910 crore in 1980-81 to Rs 8,831 crore in 1989-90.

To add to the woes, there was a significant tapering off of remittances from abroad in the late 80s, particularly in the aftermath of the Gulf crisis, and a slowing down of tourist traffic, which together have contributed to a decline in net invisibles. In recent months the problem has been exacerbated as most of the NRIs have not been renewing their deposits which have matured in the foreign currency non resident (FCNR) account. The FCNR deposits grew rapidly from about Rs 255 crore in 1985 to around Rs 17,000 crore in late 1990. Most of these deposits were for a period of three years and started maturing since 1988. While they were earlier renewed in a routine manner there has been some reluctance in recent months on the part of depositors to renew their deposits. All of these factors have together contributed to the foreign exchange reserves being under severe pressure.

NEW PROPOSALS

It is in the context of the above economic setting that one needs to look at the latest budget proposals. As noted earlier the

budget proposals are purported to be viewed as part of a broader package of measures covering trade, fiscal and industrial policies. Confronted with the fiscal crisis of the magnitude outlined above, the finance minister has naturally had to operate within a rather severe set of constraints. The first major compulsion has been to curb the growth of expenditure to keep the fiscal deficit within the limit of 6.5 per cent of GDP as has been mandated by the IMF. This requirement has been met, but the unfortunate part is that it is capital rather than revenue expenditure that has been trimmed. Given the double digit inflation rate, the allocation for capital expenditure, in real terms, would appear to have gone down. The adverse consequences of this on long term growth and productivity are obvious.

The finance minister has shown restraint in the allocation for defence, and this cannot but be welcomed. At Rs 16,350 crore, the defence outlay is up Rs 600 crore from the past year, but given the rise in prices and the depreciation of the rupee this is undeniably a cut in real terms. It is high time that defence expenditure not be regarded as something sacrosanct, and that the money allocated to defence be used in the most cost effective manner.

Perhaps the most controversial measure of the budget has been the decision to cut fertiliser subsidies, which is one of the major conditionalities of the IMF. It was originally stated that the subsidies would be cut by about Rs 400 crore which would have the effect of pushing up fertiliser prices by an average of 40 per cent. Since the quantum

of fertiliser subsidy in the past year has been of the order of Rs 4,400 crore, it was clear that the extent of the cut was a gross underestimate, as was confirmed later. In any case this was expected to be politically a highly contentious issue, and faced with opposition from dominant farmers' lobbies, the government has had to backtrack and the price rise is to be limited to 30 per cent, while small and marginal farmers are to be exempted from this hike. The wisdom of the dual pricing scheme is not clear at all as its implementation will be difficult and several states have already refused to co-operate.

The increase in fertiliser prices would set in motion the train of pushing up the procurement prices and ultimately the issue prices of foodgrains in the public distribution system unless food subsidies are commensurately increased to maintain the issue prices at a stable level. Provided the latter can be ensured, i.e., food subsidies be appropriately increased, one cannot seriously question the logic of trimming fertiliser subsidies because there is good reason to believe that the larger farmers use chemical fertilisers relatively more intensively. There is also an inter-regional disparity as farmers in the relatively more prosperous states use more fertiliser per hectare in comparison to their counterparts in the poorer states. The proviso is important since it is absolutely vital to maintain the prices of foodgrains in the ration shops at a stable level. If in fact one cannot ensure a *pari passu* increase in food subsidies then one would rather that fertiliser subsidies not be cut.

This is a matter of no small importance since providing subsidised foodgrains is one of the best ways of ensuring distributive justice. There is of course substantial scope for improvement in the working of the public distribution system as it exists today. This can be achieved by targeting it better. There is a good case for disenfranchising the rich and the upper middle class in the urban areas from their access to the PDS and the resources thus saved may be redirected to the rural and tribal hinterlands of the country. The other reason for maintaining cheap and stable prices of foodgrains in the PDS is that it helps to keep inflation in check. A major problem regarding the inflation of 1990-91 was that it was concentrated on essential commodities such as foodgrains, vegetables, pulses and edible oils, with the wholesale price index for food articles as a whole rising by as much as 18.9 per cent.

On the taxation front one would have liked to see some bold initiatives in the sphere of direct taxes but presumably the time has been short. As regards the rate schedule of personal income tax, the finance minister is probably right in leaving it untouched. There is a good deal of professional support to the view that confiscatory marginal tax rates are counter-productive. One cannot however be enthusiastic about the new scheme regarding deposits with the National Housing Bank whereby persons making such deposits will not be required

to disclose the source of funds, and that monies deposited would be provided complete immunity from enquiry and investigation. Sops like this are no good for the morale of the honest tax payers.

In order to shore up budgetary resources the government has decided to disinvest up to 20 per cent of its equity in selected public sector undertakings in favour of mutual funds and investment institutions in the public sector, which is expected to yield Rs 2,500 crore to the exchequer. This again is part of the broader thinking in favour of privatisation and marketisation which one has been hearing of lately and which also happens to be yet another of the IMF directives. Reports have suggested that some profit making PSUs have been earmarked for the purpose, because loss making units would presumably not have much of a market value. However barring the core sector and infrastructural units in the public sector, one might legitimately wonder as to why some of the loss making and sick units in the public sector are not being turned over to the private sector on the very grounds of efficiency and accountability that is supposed to be the latter's forte. Such a move is however unlikely to be attractive to the private sector. None would today argue for more of the same kind of public sector with its bureaucratisation and unaccountability that we may have had as part of the Nehruvian legacy. The public sector quite clearly has to be more accountable, but more generally there is greater need for public action in the area of literacy, health, child care, and provision of drinking water among others.

In the foreign trade sector the major policy changes have included the devaluation, the withdrawal of the cash compensatory scheme (CCS) for exporters and the enlargement of the replenishment licensing scheme to cover all non-essential exports. From now on all exports are to have a uniform RLP rate of 30 per cent of the freight on board value, up from the earlier rates ranging from 5 to 20 per cent. The aim of these measures is to make our exports more competitive, imports dearer and the hope is that the balance of payments would improve in due course. This optimism is however without any firm basis. Much of India's exports either have structurally low price elasticities, or face inelastic demand owing to protective import policies being pursued by our major trading partners. There will, in addition, be two other harmful consequences of the devaluation: (i) it is bound to give further fillip to inflation because many key inputs that are imported will now be more expensive, and (ii) the general resource crunch in an inflationary environment will lead the government to cut expenditure on some economic or social services, which would be recessionary—as has already been borne out by some of the budgetary measures, whereby capital expenditure, in real terms, on several infrastructural activities has gone down.

In the sphere of industrial policy the

foreign equity limit has been increased to 51 per cent in 34 high priority industries, licensing has been removed except in 18 industries, the MRTP asset limit has been done away with, and up to 100 per cent equity holding is to be permitted for MNCs, if they are export oriented, among others. While one cannot but welcome the move to eliminate the bureaucratisation and delay in our present system, a legitimate worry is that the new measures would accentuate the concentration of industrial wealth. As regards foreign capital one cannot share the optimism regarding its willingness to come to India in any substantial degree in the face of a widely held perception of political and social uncertainties in the country.

SUMMING UP

On the whole one cannot be enthusiastic about the recent package of economic policy measures which is inevitably going to be highly inflationary, which is going to slow down investment in economic and social infrastructure and which in additionally going to hurt the interests of the poor via cuts in real terms, on schemes like the rural employment generation programme. What is particularly distressing is the inescapable feeling that we have had to adopt these policies under duress, and in a hurry, to be able to procure a large structural adjustment loan from the IMF, in the process compromising our economic sovereignty.

This is not to deny that the trade and fiscal sectors of the Indian economy are undergoing possibly their severest crises, calling for drastic remedial measures. These should however be undertaken entirely on our own terms, giving utmost consideration to minimising the cost of adjustment that is to be borne by the poor.

India's external debt of around \$ 70 billion places it as the third highest indebted country in the world today, after Brazil (\$ 122 billion) and Mexico (\$ 101 billion). India's total debt service as a percentage of exports of goods and services is of the order of around 26 per cent. Anything above 20 per cent is considered a serious burden. Another substantial loan from the IMF will suck India further into the quicksands of debt. It is worth recalling that barely four years ago India was the seventh most indebted country and that its position has sharply worsened since then.

In the fiscal sector, the larger issues still remain to be addressed. The tax system needs to be restructured. The overwhelming reliance on indirect taxes has to be reduced and the base of personal income tax has to be widened. Simultaneously there has to be the political will to take stern measures against tax evaders and the operators in the parallel economy. And above all there has to be a determined effort to curb wasteful current expenditure, and not capital expenditure on social and economic infrastructure. This is a rather daunting agenda, but a beginning has to be made.

Karnataka Power Corporation Ltd.

A POWERFUL COMMITMENT

POWER is the lifeblood of any economy. And as Karnataka grows, so does its demand for Power.

THE KARNATAKA POWER CORPORATION LIMITED (KPCI) is playing a vital role in augmenting power for the State of Karnataka. It has crossed many milestones during the past 21 years and has set ambitious targets for over-coming the power crisis and assisting the growth of the economy.

Nine Hydro Generating Stations are in operation besides a Thermal Power Plant at Raichur. The total installed capacity of Hydro Power in the State is 2310 MWs and that of Thermal Power is 630 MWs totally contributing over 13,000 MUs per annum.

Further the Varahi Hydro Electric Project, Kalinadi Stage II, Ghataprabha, Gerusoppa Hydro Electric Project, the III and IV Units of Raichur Thermal Power Plant and Muni Hydel Schemes are some of the new Projects under execution which will help KPCI in its commitment.

Adjustment in the 1991-92 Budget Hard-Headed or Soft-Headed?

S Guhan

The Economic Survey urged a "serious effort to introduce corrective measures through hard decisions and difficult choices" The budget's response to this call, the fudging apart, is feeble And given the compulsion to contain the fiscal deficit to 6.5 per cent of GDP, incremental investment in infrastructure is likely to be seriously reduced in real terms in the coming year, retarding both growth and adjustment in the medium term

THE union budget for 1991-92 projects a reduction in the fiscal deficit (FD)—which is the most comprehensive indicator of fiscal management—from 8.4 per cent of GDP in 1990-91 (RE) to 6.5 per cent in 1991-92 (BE). As per cent of GDP, FDs which were between 5.4 and 6.3 in the early 1980s had risen to the 7.5 to 9.0 range in the later 1980s (vide Table 1). Reducing the FD from 8.4 to 6.5 per cent of GDP or by nearly 23 per cent over a single year certainly seems to be an impressive achievement. The object of this note is to examine closely the mode of the proposed adjustment with particular reference to its credibility, sustainability and longer term implications.

REDUCING DEFICITS

Leaving aside the monetised deficit (i.e. increase in net RBI credit to the central government)¹ which cannot be estimated for 1991-92 at the time of budget presentation, the three other kinds of deficits involved in the budget and their interrelationship are set out in the following identities (deficits carry a plus sign):

- (1) Revenue Deficit (RD) = Revenue Expenditure (RE) - Revenue Receipts (RR)
- (2) Budgetary Deficit (BD) = RD + Net Capital Disbursements (NCD)
- (3) Fiscal Deficit (FD) = RD + NCD + Borrowings (B)

NCD is capital outlay plus loans (gross) minus loan recoveries. Borrowings include borrowings from all sources (external and domestic) and other liabilities (such as deposits).

In operational terms, the FD can be lowered by reducing BD and borrowings. It is necessary to reduce borrowings so as to reduce the government's draft on domestic savings, dependence on external flows, and future interest payments. For a given level of B, BD can be reduced by reducing the RD or NCD or both. RD can be reduced by improving RR or reducing RE or both. There is thus a trade off in any scheme of adjustment between RD and NCD and again between RR and RE. The path of adjustment has to be evaluated with reference to the direction and extent of the trade offs and their policy implications.

Table 2 shows in GDP terms² how the reduction in the FD has been attempted, in

terms of its components, in 1991-92 (BE) with reference to 1990-91 (RE). Borrowings it will be seen are proposed to be reduced by 12.7 per cent (in terms of the GDP ratio). The reduction in net capital disbursements is 18 per cent. The reduction in revenue expenditures is only 3.4 per cent and the improvement in revenue receipts only 4.5 per cent. Thus in the main, the FD has been reduced by a reduction in incremental capital outlays i.e. through a deceleration in public investment rather than through any significant reduction in the RD which is the core deficit.

In the interests of better fiscal management, it is imperative to roll back the FD. We may also assume that in terms of a

specific target the FD will have to be maintained at 6.5 per cent of GDP as part of the adjustment process agreed with, and subject to monitoring by the IMF. The FD being the sum of RD and NCD, this means that if the RD increases during the year because of shortfalls in RR and/or increases in RE, capital outlays will have to be cut further in order to adhere to the 6.5 per cent target. This leads us to look at how plausible the budget estimates of RR and RE are of which the RD is the resultant.

REVENUE RECEIPTS

Table 3 shows the composition of revenue receipts. It will show that not additional

taxation in 1991-92, the corporation tax, income tax, and union excise duties taken together are expected to amount to only 3.9 per cent of GDP in 1991-92 (BE) compared to 4.3 per cent in 1990-91 (RF). Taking into account an increased contribution of 0.4 per cent from customs duties and another 0.4 per cent from the net yield to the centre from additional tax measures, the budget shows an overall increase in tax revenues of 0.4 per cent. Along with an improvement of 0.1 per cent in non-tax revenues, total revenue receipts show an increase of 0.5 per cent in GDP terms.

Table 3 gives rise to three concerns. First, the budget does not reflect any attempt to improve the elasticity of direct taxes and union excise duties in which, as is well known, there is considerable tax avoidance and tax evasion. Second, the large anticipated increase in customs revenue in 1991-92 (BE) over 1990-91 (RL) from Rs 20,800 to Rs 26,410 crore (net of concessions), i.e. an increase of 27 per cent, would appear to be because of the devaluation. However, it is not clear whether the estimate adequately takes into account the import contraction that is likely (and will be required) to take place in 1991-92 because of other measures such as the premium on RFP licences, credit curbs to curtail imports, etc. In the result, if customs revenues, which mainly explain the anticipated improvement in tax revenues in 1991-92, are overpitched, there could well be an overall shortfall in revenue receipts. The third concern, which is related to the second, is in regard to the sustainability of customs revenue at current proportions of GDP. The devaluation and other measures such as RFP financing and credit curbs represent a stiff burden on importers which, as balance of payments adjustment proceeds, will have to be eased by tariff reductions resulting in reduced proportionate contributions from customs duties to the budget.

NON PLAN REVENUE EXPENDITURES

Turning to revenue expenditures, they consist of non-plan and plan revenue expenditures each of which has distinct characteristics. Table 4 gives the composition of non-plan revenue expenditures in 1990-91 (RE) and 1991-92 (BE). In the short run, nothing can be done about the increase in the interest burden. Defence revenue expenditures have been more or less contained in 1991-92 over 1990-91 and if anything, they are only likely to increase during the year. There is a modest increase in the food subsidy which may have to go up further if higher procurement prices are allowed to compensate for the reduction in the fertiliser subsidy without a countervailing increase in issue prices so as to avoid inflation in the administered price of a sensitive item of mass consumption. The provisions for fertiliser and export subsidies have been reduced and are not likely to go down further. All that one can hope for is that the reductions

will be maintained. Other subsidies have been held at the same level between 1990-91 and 1991-92. The residual item in the table ('others') relates to expenditures on general services, police, tax collection, pensions, and a variety of non-plan developmental expenditures in respect of social and economic services in the revenue account. The aggregate provision for this entry has been reduced from Rs 17,463 crore in 1990-91 (RE) to Rs 16,831 crore in 1991-92 (BE) or by 3.6 per cent, eliminating the loan write-off provision in 1990-91 (RE) which does not figure in 1991-92 (BE). The increase is a marginal one of 2 per cent. This is patently implausible considering that these expenditures are quite sticky and that the average annual increase under this head has been of the order of 16 per cent in the previous five years. The increase between 1989-90 and 1990-91 (RE) is actually 15 per cent even without taking into account the loan write-off and debt relief provisions in 1990-91 (RE). There is every likelihood, therefore, that non-plan revenue expenditures in 1991-92 will turn out to be significantly higher than what has been presented in the budget.

PLAN REVENUE EXPENDITURES

Plan revenue expenditures in the budget are to increase from 2.1 per cent of GDP in 1990-91 (RE) to 3.0 per cent in 1991-92 (BE). These expenditures comprise (a) the centre's own plan expenditures in the revenue account, (b) grants for central and centrally sponsored plan schemes to states and UTs, and (c) normal plan assistance to states and UTs in the revenue account. Table 5 shows

the trends in these components in 1985-90, 1990-91 (RE) and 1991-92 (BE). During 1985-90, all three components have steadily increased, allowance being made for an accounting shift between items (a) and (b) in 1989-90.¹ There have been further increases in each component between 1990-91 (RE) and in 1991-92 (BE).²

Total plan outlays implemented at the central level (net of all transfers to states, including those for central and centrally sponsored plan schemes) consist of the

ditures in its budget and capital outlays incurred through public sector enterprises (PSEs) financed by their internal resources and borrowings.⁵ Table 6 will show that the revenue component in plan outlays at the central level has steadily increased during the Seventh Plan (1985-90). The proportion which was 11.2 per cent in 1990-91 (RE) has risen further to 12.6 per cent in 1991-92 (BE).

PLAN OUTLAYS AT CENTRE

The composition of plan outlays at the central level (net of all transfers to states and including plan outlays of PSEs) is given in Table 7 for 1990-91 (RE) and 1991-92 (BE). It will show that while overall plan outlays at the central level are to increase by 11.0 per cent between 1990-91 (RE) and 1991-92 (BE) the increase is only 8.1 per cent in infrastructure. On the other hand, the increase in allocations for social services is as high as 63 per cent. The centre's own plan expenditures on agriculture and allied activities and social services, apart from its transfers to states via central and centrally sponsored schemes for these purposes, is not insignificant, being about 11 per cent of the overall plan outlay at the central level in 1991-92 (BE). Assuming an inflation rate of 9 per cent in 1991-92 (as estimated by the finance minister), there will be a decrease in real terms in infrastructure plan outlays. The reduction in real terms is actually likely to be much higher since infrastructure investments on energy, industry, transport and communications, being import intensive, will be particularly affected by the devaluation. The deceleration of infrastructure investments will obviously have an adverse impact on long term growth as well as on medium term balance of payments adjustment because of the importance of investments in energy industries (such as fertilisers, steel and non-ferrous metals), transport and communications for import substitution, export promotion and for capacity utilisation and capacity creation in the private sector. The retardation in incremental public investments in infrastructure is the most disturbing outcome of the financing pattern in the budget. It continues instead of arresting or reversing the trend in the late 1980s of a deceleration in capital formation through the budget coupled with a declining share of public savings in the financing of it.⁶

Table 8 brings out longer term trends in the level of central plan outlays (including outlays on central and centrally sponsored schemes) and their financing pattern. In the Seventh Plan period (1985-90), while plan outlay was 7.8 per cent of GDP in line with the (now forgotten) Long Term Fiscal Policy's (LTFP) indicative projection, its financing pattern had seriously deviated from the LTFP. The shortfalls in balance from current revenues (BCR) and in PSE contributions had to be made good by increased external and domestic borrowings

in 1991-92 (BE) the level of plan outlay as a proportion of GDP has been reduced, on one hand, from 7.8 per cent of GDP in 1985-90 to 7.4 per cent and, on the other, larger contributions from PSEs have been envisaged in financing it. The 1991-92 budget seeks to finance the same level of plan outlay in relation to GDP as in 1990-91 (RE) through projected improvements in BCR (1.1 per cent) and PSE contributions (0.1 per

cent) in order to offset projected reduction in borrowings and other capital receipts (0.8 per cent) and in the budgetary deficit (0.4 per cent). The projected improvement in the BCR, as we have shown, is in part due to an under estimation of non-plan revenue expenditures. The reduction in the budgetary deficit, as we have shown, has been sought to be achieved, apart from the under-estimation of non-plan revenue expenditures, by constraining infrastructural investments

while, at the same time, plan revenue expenditures, particularly on social services, have been allowed to increase.

The government's unwillingness and inability to reduce the revenue deficit, which is at the core of the fiscal deficit, is also brought out in Table 9 which compares the Ninth Finance Commission's (NFC) normative projections of the centre's revenue account in 1990-91 and 1991-92 with the estimates for these two years in the budget. In both years, the RDs will turn out to be much larger than the NFC's normative levels. With reference to the NFC's projection, the 1991-92 BE shows an improvement in tax revenues, a reduction in Finance Commission related transfers to states, and a small reduction in subsidies. These are offset by lower non tax revenues, much higher interest payments, and much higher plan revenue expenditures. In turn, the latter reflect poor returns to the budget from PSEs, continued high revenue deficits financed by borrowings in earlier years and an unwillingness to restrain mounting current outlays in the plan.

To complete the analysis, it must be pointed out that the so called 'contribution' of PSEs includes not only their internal resources supplemented by budget support but also a significant element of borrowings and other liabilities. The fiscal deficit of the centre and what corresponds to it in the case of PSEs should therefore, be viewed together. This is done in Table 10 for 1990-91 (RE) and 1991-92 (BE). It will show that the combined fiscal deficit of the centre and its enterprises will be 10.6 per cent in 1991-92 (BE) and that its reduction from 12.4 per cent in 1990-91 (RE) has been achieved mainly by reducing the centre's own borrowings. In good measure, PSEs continue to depend on borrowed resources, a dependence which can be reduced only if they begin to generate larger genuine internal resources.

CONCLUSION

The fiscal adjustment process charted out in the budget for 1991-92 is not adequate or consistent with growth and balance of payments equilibrium in the medium to long-term. The government has not, at least as yet, come to grips with tax evasion and avoidance in order to improve tax receipts. Growth in non-tax revenues continues to be sluggish given poor returns from PSEs. Even if the reductions in defence revenue expenditures and in the fertiliser subsidy and the improvement in customs duties hold good, as estimated, for 1991-92, continued mileage cannot be expected from these sources. The promised reduction in non plan revenue expenditures (other than defence, interest, and subsidies) is not plausible. Plan revenue expenditures, which have continued to run high during the Seventh Plan, have been given a further boost reflecting the post election populism of the ruling party to which the finance minister has yielded. Non

plan outlays (revenue and capital) and plan revenue expenditures could actually go up if allowance is made for unanticipated increases (e.g., defence, internal security, natural calamities) and for inevitable expenditures not fully provided for in the budget estimates (e.g., dearness allowance increases, impact on government expenditures of devaluation and of increases to administered prices). The promised contribution from PSEs cannot be taken for granted. No concrete measures have been outlined for improving efficiency and returns in central PSEs or in State Electricity Boards. As a result of all these factors, and given the need to contain the fiscal deficit to 6.5 per cent of GDP, incremental investment on infrastructure is likely to be seriously reduced in real terms in the coming year, retarding both growth and adjustment in the medium term. The *Economic Survey* urged a 'serious effort to introduce corrective measures

through hard decisions and difficult choices". The budget's response to this call, the ludging apart, is quite feeble.

Notes

1. The monetised deficit is the sum of the net increase in the RBI's holdings of treasury bills and its contribution to the market borrowings of the government. Reductions in the budgetary deficit and in borrowings are necessary to reduce the monetised deficit and thereby the growth in money supply just as they are required for reducing the fiscal deficit.
2. GDP in current market price is estimated at Rs 442 769 crore in 1989-90 in the *Economic Survey, 1990-91*. We have extrapolated it at Rs 515 845 crore on the basis of the official estimates for inflation and real growth for 1990-91. For 1991-92, an inflation rate of 9 per cent and a real growth of 4 per cent as predicted by the Finance Minister have been used to estimate GDP at Rs 52 905 crore.
3. Expenditure on the Jawahar Rozgar Yojana

scheme for rural employment, which was introduced in 1989-90, appear to have been treated in that year as a direct central outlay.

4. Curiously, the lump sum provision of Rs 250 crore under the ministry of finance in 1991-92 (BI)-for the 'new initiatives'-viz., corporation for the welfare of backward classes, National Renewal Fund for workers, care of children of families affected by communal riots, national integration scheme for youth, promotion of South-South co-operation and Rajiv Gandhi Foundation - has been shown as part of grants to states for central and centrally sponsored schemes (Vide 1991-92 Expenditure Budget Vol I Statement 16 at p 51). Hiding this needle in this particular haystack is a piece of cheating since the 'new initiatives' are not reliable either to the plan and/or to the states.

5. Budget support to PSEs via equity and loan has been included as part of capital expenditures in the budget and hence netted out of PSEs' total investment outlays.

6. See table 7.7 at p 110 of the *Economic Survey, 1990-91*.

ISID INSTITUTE FOR STUDIES IN INDUSTRIAL DEVELOPMENT NEW DELHI

The Institute for Studies in Industrial Development (ISID) is a sponsored institution of the Indian Council of Social Science Research (ICSSR) established to undertake, promote and coordinate research in the area of industrial development.

The Institute wishes to recruit Faculty at the level of **Professor, Associate Professor and Assistant Professor** carrying UGC pay scales. The ISID is also interested in appointment of a few **Research Fellows** on consolidated salary.

Prospective candidates for the posts of **Professor and Associate Professor** should have a doctoral degree in Industrial Economics/Commerce with a good academic record and research experience of at least ten and five years, respectively. Candidates should have proven aptitude and inclination for undertaking empirical work in the area of industrial development, foreign investments, transfer of technology, regulations or foreign trade.

The minimum prescribed qualification for **Assistant Professor** is an M.Phil in Economics/Commerce with specialisation in studies relating to: industrial structures; industrial policy and regulation; industry case studies; industrial finance; public enterprises; industrial location; regional development; transnational corporations; technology transfer; and foreign trade.

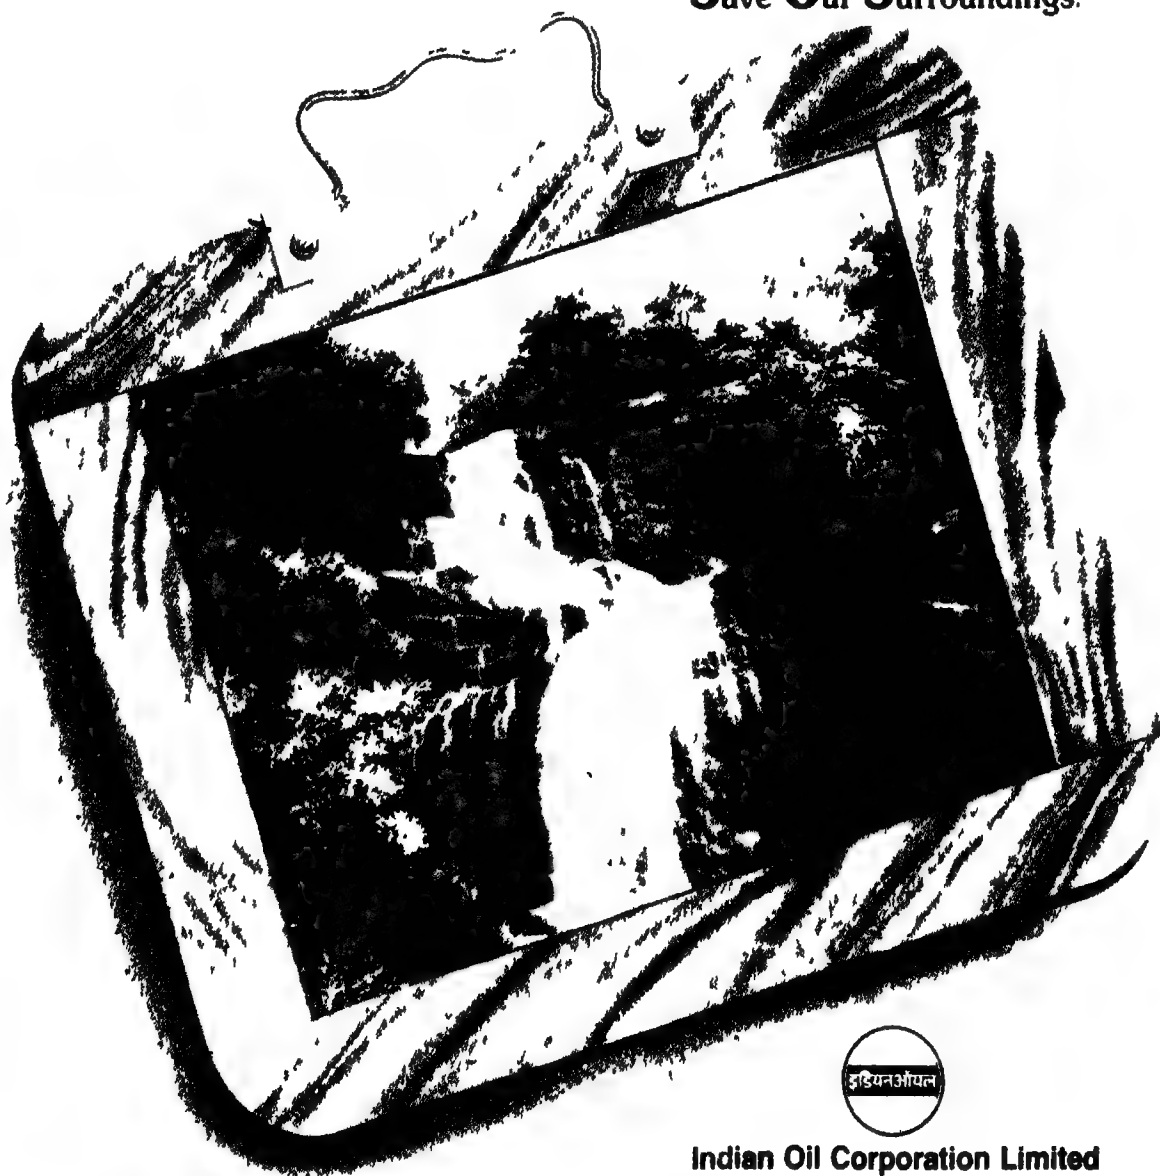

Minimum qualification for **Research Fellow** is First/High Second Class Post-graduate degree in Economics/Commerce/Statistics. Candidates with M.Phil. degree or working for Ph.D. in the areas specified for **Assistant Professors** will be given preference. The post carries a fixed salary of Rs. 2,500-3,000 p.m.

Applications giving details of qualifications, experience and publications, along with names of two referees, should reach the Director, Institute for Studies in Industrial Development, Narendra Niketan, I.P. Estate, P.B. No. 7151, New Delhi - 110 002 by 30th September 1991.

Is the world's best open-air school closing down?

Nature. It's the best open-air school open to mankind. Unfortunately, this school is facing bad times. Thanks to man. And his destructive ways. At Indianoil, we understand how important it is to maintain the ecological balance. To us, fresh air and clean water are as precious as oil. One cannot be sacrificed for the other. Never. When setting up our refineries, environmental protection is foremost on our minds, never an afterthought. We regularly monitor air quality (at every single refinery of ours) to check air pollution. Effluent discharge is analysed 365 days of the year. It is progressively treated and productively used for irrigation. As trees breathe life into our environs, we have developed green belts around our units. Ecological parks too. Last year, we planted more than one lakh trees. All of us are indebted to Nature. So let's preserve its pristine glory. Or soon, a beautiful memory is all that will remain of it!

Save Our Surroundings.

Indian Oil Corporation Limited

Macro Imbalances, Stabilisation Programme and Union Budget

B B Bhattacharya

Given the overall economic background against which the 1991-92 budget has been framed, it was expected that the budget would carry forward the liberalisation programme in the area of fiscal policy. The budget proposals are, however, cautious in this regard.

THE union budget for 1991-92 has been presented against the background of a severe crisis in the Indian economy. At the time of the presentation of the budget, the foreign currency reserve had dwindled to just half a month's import. There was a run down of NRI deposits. The external debt/GDP ratio had climbed to 23 per cent¹ and despite two contingency loans from the IMF in July 1990 and January 1991 and desperate measures like selling and mortgaging gold abroad debt servicing had become an acute problem. International creditworthiness has hit the bottom. The domestic situation is equally precarious. Internal debt has risen to nearly 60 per cent of GDP. In 1990-91 the revenue deficit of the centre was 3.4 per cent of GDP, monetised deficit 3 per cent and gross fiscal deficit 8.4 per cent. Interest payment has become the largest item of expenditure in the centre's budget, accounting for as much as 28 per cent of non plan expenditure and 38 per cent of current revenue. The inflation rate has accelerated to double digit level.

Faced with this grim situation the newly installed government has announced its decision to negotiate a \$ 5.7 billion loan from the IMF under the structural adjustment programme. The origins of the problem, according to Manmohan Singh, minister of finance, are directly traceable to large and persistent macro economic imbalances and low productivity of investment (p. 2, Budget Speech). The solution, according to the government, lies in the liberalisation of the economy, in both the domestic and external sectors. As a first step, the rupee was depreciated by nearly 20 per cent in relation to foreign currencies. Following this a new trade policy has been announced deregulating imports. The new industrial policy announced thereafter delineates private investment in all but a few sectors, removes restrictions on MRTP investments and allows foreign equity participation up to 51 per cent in general and up to even 100 per cent in export oriented industries. There would be now automatic imports against exports and foreign equity capital. Interest rates have been partially deregulated by removing the ceiling on advance rates and there has been a general increase in the interest rates structure.

The overall economic philosophy of the new government appears to be an open economy, decontrol and deregulation of trade and industry, reduction in the size of the public sector and tight monetary policy.

These policies are consistent with the IMF's structural adjustment programme². The IMF also advocates cut in both monetised and gross fiscal deficit, lower defence expenditure, gradual abolition of subsidies, privatisation of public enterprises, lower tax rates, both direct and indirect, and lower size of public expenditure in relation to GDP.

BUDGET PROPOSALS

Given this background it was expected that the budget would carry forward the liberalisation programme in the area of fiscal policy. The actual budget proposals are, however, somewhat cautious in this regard. There is no announcement of privatisation of any public enterprise. There would however be disinvestment up to 20 per cent of equity capital in select public enterprises. Direct tax rates are not reduced, on the contrary there is an increase in the corporate tax rate. The provision for depreciation has been reduced from one third to one fourth for corporate taxation. Customs duty has been reduced moderately and not drastically as was expected after the exchange rate depreciation in early July. There may be two reasons why the budget is relatively more cautious than either the new trade policy or the industrial policy. First, there is an immediate problem of reducing the deficit, which is one of the pre conditions for an IMF structural adjustment loan. Second, the government may not be sure of carrying forward the full liberalisation programme politically. Besides some of the measures like privatisation, can be implemented in

dependently of the budget. The government may therefore like to first get the budget approved by the parliament before announcing a more radical liberalisation programme. The finance minister has announced in his budget speech that he would favour a cut in tax rates after the fiscal deficit has been brought within a reasonable limit.

The main thrust of the budget appears to be reduction in the fiscal deficit. The budget proposes to bring down the revenue deficit from 3.4 per cent in 1990-91 to 2.3 per cent in 1991-92, the monetised deficit from 3 per cent to 1.3 per cent and the gross fiscal deficit from 8.4 per cent to 6.3 per cent. The deficit is expected to be brought down through expenditure control and resource mobilisation. Plan expenditure has been frozen in real terms, 12 per cent rise in nominal value in 1991-92 budget estimate over revised estimate of 1990-91, against 10 per cent inflation rate in 1990-91.⁴ Central plan outlay in industry and minerals will decline by more than 10 per cent in real terms. On the other hand, plan outlay on agriculture and social services will increase in real terms by about 20 and 25 per cent, respectively. Plan outlay in energy, transport and communications would be more or less same as last year in real terms. This budget has therefore a distinct bias in favour of agriculture and social services vis-à-vis industry and infrastructure.

The budget proposes to cut non plan expenditure by about 6 per cent in real terms. Defence expenditure will also be cut by about 6 per cent in real terms. A major

| 1989-90 | 1.7 | 10.7 | 9.0 | 19.9 | 12.9 | 7.0 | -2.3 |

Note: * Investment refers to gross domestic capital formation unadjusted for errors and omissions which vary between 0.0 per cent of GDP in 1988-89 and 2.5 per cent in 1981-82.

Source: Government of India, *Economic Survey*, 1990-91.

contribution of the budget is the cut in subsidy. Export and sugar subsidy are abolished. Fertiliser subsidy was initially cut by about Rs 1,600 crore. Subsequently, however, the fertiliser price increase has been brought down from 40 per cent to 30 per cent for large farmers and 20 per cent for small farmers. On the top of that the finance minister has assured a rise in procurement prices to compensate for the increase in fertiliser prices, which may lead to a higher food subsidy. The net effect of the fertiliser price rise on the government budget therefore may be much less than desired.

There are two broad measures of resource mobilisation: tax revenue worth about Rs 2,000 crore and disinvestment of equity holding in public sector enterprises worth Rs 2,500 crore. The major tax proposals in this budget are: (a) hike in corporate tax rate and lower provision of depreciation allowance for corporate taxation, (b) reintroduction of interest tax, (c) wider coverage of expenditure tax, (d) hike in special excise duty (some mass consumption goods exempted), (e) rise in excise on luxury consumer durables, (f) further extension of MODVAT, (g) decrease in *ad valorem* rates of customs and (h) reduction in auxiliary customs duty. All taken together, the direct tax proposals may yield Rs 2,139 crore, of which the centre's share is Rs 2,042 crore, and indirect tax proposals may lead to a net revenue loss of Rs 37 crore (net revenue loss from customs Rs 510 crore against net yield from excise Rs 988 crore, of which the centre's share is Rs 473 crore).

Other major features of this budget are: (a) provision of conversion of black money into white money through deposits in the National Housing Bank of which 40 per cent would be deducted as implicit tax, (b) exemption of gift tax on foreign currency remittance, (c) introduction of foreign exchange bonds, (d) increase in prices of oil products (except kerosene), and (e) tax exemptions on donations for social science research.

MACRO IMBALANCES

The IMF stabilisation programme has two key assumptions: (a) the current account deficit is the result of overvaluation of exchange rate and high fiscal deficit, and (b) inflation is a monetary phenomenon. Both the assumptions need careful scrutiny in the Indian context.

By definition

$$Y = PC + GC + PI + GI + E - X$$

$$Y = PC + PS + T$$

where Y is aggregate expenditure, PC and GC are private and government consumption respectively, PI and GI are private and government investment respectively, E is exports, X is imports, PS is private saving and T is tax revenue net of transfers.

Rearranging the terms we get another identity:

$$GI - GS = (PS - PI) + (X - E)$$

where GS is government saving ($T - GC$).

This identity shows that if government investment is more than government saving then there would be transfer of resources from either domestic private sector and/or external sector. If private saving equals private investment then overall fiscal deficit would be a direct function of net capital in

flow. However, if the fiscal deficit is zero, $GI = GS$, then it does not guarantee zero current account deficit, for if PI is more than PS also there would be a net capital inflow. Similarly, a balanced current account, $X = E$, does not automatically imply zero fiscal deficit.

TABLE 2 PUBLIC SECTOR SAVING

There is no uniform relationship between fiscal deficit and current account deficit in either developed or developing countries. In USA the current account deficit is a mirror reflection of the fiscal deficit. But in UK the current account has worsened in the 80s despite a significant improvement in the fiscal balance. In other developed and developing countries also there is no uniform relationship between fiscal and current account deficit.

Table 1 shows that there is no systematic relationship between the public sector saving-investment gap and the current account deficit in India. The public sector saving-investment gap has widened during the 80s more due to a fall in the public saving rate than a rise in the public investment rate. Private saving-investment gap has also widened, again more due to increase in private saving than a fall in private investment.

Table 2 shows that the public sector saving has declined basically due to increasing dissaving by general government. Further, general government dissaving has increased mainly due to a relatively faster growth of current transfers over government current revenue. Government consumption has increased almost at the same rate as government current revenue. Econometric results suggest that private propensity to save out of government transfers—interest on public debt, subsidy, etc.—is higher than out of other disposable income [Bhattacharya and Guha, 1990b]. A reduction in the fiscal deficit may therefore increase public saving partially at the expense of private saving.

The exchange rate of the rupee has depreciated continuously throughout the 80s. But so far it does not seem to have made any impact on either the trade balance or the current account deficit (see Table 3). Rupee has been depreciated by another 20 per cent in July 1991. The immediate impact of this is likely to be on the price level, which in turn may have an adverse effect on trade balance and fiscal balance. In this respect there appears to be an inconsistency between the objectives of trade policy of 1991 and the budget for 1991-92.

FISCAL DEFICIT AND INFLATION

The budget aims to control prices through restraint on the money supply growth rate. Money supply is, however, one of many factors that influence the price level in India. Differential growth of agricultural and non-agricultural output, administered price, procurement price, public distribution of foodgrains, wage rate, import price and exchange rate are other major determinants of inflation in India. Table 4 shows that there was no excessive growth of money supply (either M_1 or M_2) in 1990-91; in fact money supply growth rate in 1990-91 was lower than that in the last few years. And yet the inflation rate in 1990-91 was higher than in the past several years. The main reasons for this is the steep rise in procurement price and im-

port price and fall in exchange rate. In 1991-92 exchange rate has already depreciated by nearly 30 per cent (July 1991 over March 1991). Procurement prices have already been hiked for the 1991-92 kharif season by 5 to 15 per cent. Administered prices for petroleum products have been increased by 20 per cent. Railway tariff has also gone up by 10 per cent. There is likely to be a general cost push inflation with or without accommodating money supply.

The 1991-92 budget makes a bold attempt to reduce the fiscal deficit (see Table 5). If the budget succeeds then monetised deficit (RBI net credit to the government) and primary deficit (gross fiscal deficit less interest payments) in 1991-92 would be lower than in any year in the 80s. Budget deficit (government short-term borrowing and cash balance adjustment) and gross fiscal deficit would be in the range of that in the early 80s and the revenue deficit would be of the level of the mid-80s. In the past, however, there has been a big discrepancy between budget estimates and the actual deficit. In 1990-91 for instance the revised estimates of revenue deficit, budget deficit and monetised

deficit were nearly 50 per cent larger than the budget estimates. Primary deficit and gross fiscal deficit are also significantly higher than budget estimates. All this happened despite periodical monitoring of deficits by parliament.

When the general price level rises government current expenditure tends to increase faster than government current revenue. When this happens the government either slows down public investment and/or resorts to increasing deficit financing. The first would adversely affect growth and the second would increase the inflation rate. The annual inflation rate at present (first quarter of 1991-92) is about 11 per cent. Exchange rate depreciation (20 per cent), petroleum price rise (20 per cent) and railway tariff hike (10 per cent) together may accelerate the inflation rate in the coming months. If the procurement prices are increased further and issue prices of public distribution system are raised then the annual inflation rate in 1991-92 could be well above 15 per cent. If kharif output fails and money supply is adjusted to fill the gap between government revenue and expenditure then the inflation

TABLE 5. VARIOUS MEASURES OF DEFICIT IN CENTRAL BUDGET
(As per cent of GDP)

| Year | Revenue Deficit | Budget Deficit | Monetised Deficit | Gross Fiscal Deficit | Primary Deficit |
|--------------|-----------------|----------------|-------------------|----------------------|-----------------|
| 1980-81 | 0.6 | 1.8 | 2.6 | 6.2 | 4.2 |
| 1981-82 | 0.1 | 0.9 | 2.0 | 5.4 | 3.4 |
| 1982-83 | 0.7 | 0.9 | 1.9 | 6.0 | 3.8 |
| 1983-84 | 1.2 | 0.7 | 1.9 | 6.3 | 4.0 |
| 1984-85 | 1.8 | 1.6 | 2.6 | 7.5 | 4.9 |
| 1985-86 | 2.2 | 2.0 | 2.4 | 8.3 | 5.4 |
| 1986-87 | 2.8 | 2.8 | 2.4 | 9.0 | 5.8 |
| 1987-88 | 2.7 | 1.7 | 2.0 | 8.1 | 4.7 |
| 1988-89 | 2.7 | 1.4 | 1.6 | 7.8 | 4.2 |
| 1989-90 | 2.7 | 2.4 | 3.1 | 8.0 | 4.0 |
| 1990-91 (BE) | 2.5 | 1.4 | 1.7 | 7.1 | 3.1 |
| 1990-91 (RE) | 3.4 | 2.1 | 3.0 | 8.4 | 4.1 |
| 1991-92 (BE) | 2.3 | 1.3 | 1.3 | 6.3 | 1.7 |

Note: GDP at current market prices in 1991-92 is assumed to grow at 16 per cent (4 for growth and 12 for inflation) over 1990-91 which in turn is assumed to be 16.5 per cent more than 1989-90.

When I retire, I'll never be a burden to my son.

LIC's JEEVAN DHARA
is my guarantee for a lifelong pension.

LIC's Jeevan Dhara pension scheme means much-needed security in old age. Long before you retire, Jeevan Dhara starts building for you a monthly income for life. Here's how it works.

If you are 35 and pay a monthly premium of Rs. 500 till you are 59, you will get a minimum of Rs. 5,595/- monthly pension throughout your life from the age of 60.

Take a look at Jeevan Dhara's benefits:

- 12 post-dated cheques (one for each month) at the beginning of each year.
- Premiums paid upto Rs. 40,000 a year, are 100% deductible from taxable income under Section 80CCA of the Income Tax Act.

- Bonus addition – once when the monthly income starts and again on the death of the policy-holder in addition to the principal sum payable to the legal heirs.

For free brochure and details contact your nearest LIC office, any LIC agent or Development Officer. We will be glad to help you.

LIC-CLIP-1

could be still higher. In the past a hard squeeze on the money supply growth rate has reduced inflation rate by lowering the output growth rate.⁷ If the government tries to maintain deficit targets (IMF loan may be linked to deficit targets) by restraining growth of public investment then it may result in stagflation. The critical question is which section of the society would bear the brunt of recession and inflation? A cost push inflation, particularly related to agricultural prices, would adversely affect the welfare of the poor. Since the degree of adjustment in the budget is very limited, this year, and perhaps next two years as well, may have high inflation and unemployment with a low output growth rate. To a significant extent the adverse impact may be mitigated through a rigorous check on the procurement price, which would require a strong political will. Any further depreciation of the exchange rate and upward revision of administered price may also be counter-productive.

DEBT AND INTEREST RATE POLICY

The government budget has an inherent dynamism: deficit in the current year leads to borrowing in the current year, this in turn increases interest on public debt in subsequent years, which in turn hikes deficit and borrowing. This chain causation is further strengthened if the interest rate is raised.

There was a general increase in the interest rates structure in the 80s in comparison to the 70s. Interest rates have been further raised in the recent months. Table 6 shows that there is a dramatic shift in the maturity pattern of government securities. Long-term securities with higher interest rates now account for more than 80 per cent of outstanding government securities as against 43 per cent in 1970-71. There has been also a gradual increase in the interest rates on government securities (Table 6). The average cost of borrowing by the government has increased from about 6 per cent in 1980-81 to more than 10 per cent in 1989-90 [Bhattacharya and Guha, 1990a]. The rate of return on public investment has however remained more or less the same at around 1-2 per cent. The gap between the cost of borrowing and rate of return has therefore widened further during the 80s. Furthermore, a significant proportion of government borrowing (40 per cent in 1990-91) is now utilised for revenue expenditure yielding no return. What was needed was therefore a decrease rather than increase in the interest rates structure.

It might be argued that a fall in interest rates may discourage household saving, increase money demand and encourage use of capital *vis-a-vis* labour in production. All the three arguments are perhaps exaggerated in the Indian context. First of all the interest elasticity of household saving [Bhattacharya, 1985; and Krishnamurthy and Saibaba, 1982] and money demand is not very high in India. Secondly, a hike in the interest rates struc-

ture has not encouraged use of labour *vis-a-vis* capital in the 80s. On the contrary, NSS data shows a deceleration of employment growth rate during the 80s.

Apart from improving the fiscal balance, a lower interest rates structure may promote private investment and reduce cost of production, especially of those units which depend heavily on borrowed capital. International evidence suggests that a high interest rates structure has an adverse effect on growth. Thus from both fiscal point of view and growth point of view the interest rates structure should be reduced rather than increased.

STRUCTURAL ADJUSTMENT

It is now more or less certain that the government will borrow from the IMF \$ 5-7 billion under the structural adjustment programme. The new exchange rate policy, trade policy and industrial policy and the union budget for 1991-92 are designed to satisfy the conditions of structural adjustment. The IMF structural adjustment programme so far has had a mixed record [World Bank, 1991]. There is a special difficulty in implementing it in a democracy.

The basic problem in the Indian economy today is low productivity and excessive borrowing. Productivity is low not only in public sector but also in many private sector units which are sheltered by protection and administered price policy. What is needed is a conscious attempt to improve productivity of both labour and capital in both public and private sectors. But is it necessary to do so only through imports and external borrowing? As it is, there is a great difficulty in servicing the existing external debt. If the structural adjustment programme increases import intensity then there may be even greater difficulty in generating a trade surplus and servicing external debt. The experience of liberalisation in the 80s in this respect is quite discouraging [Mani, 1991]. Much of the problem today is due to the excessive external borrowing in the 80s. If another \$ 5-7 billion is taken now then there is a great danger of getting caught in a debt trap. The union budget for 1991-92 has many positive features: curb on deficits, lower non-plan expenditure, cuts in defence expenditure and subsidy and increase in direct tax revenue. But it makes no attempt to curb imports and external borrowing which may have dangerous implications in the long run.

Notes

- 1 According to the government of India's *Economic Survey*, 1990-91 (p 169), total external debt, including NRI deposits, as on March 31, 1991 is Rs 1,20,000 crore, which is about 23 per cent of GDP of 1990-91. However according to the World Bank's *World Debt Tables* India's external debt is about \$ 67 billion, which at the current external debt is about \$ 67 billion, which at the current exchange rate (July 1991) works out to be 33 per cent of GDP.

- 2 Growth of internal debt and its implications are discussed in Bhattacharya and Guha (1990a).
- 3 The IMF structural adjustment programme and its success are evaluated critically by Taylor (1990).
- 4 Cost of investment generally rises faster than general price index. In real term, plan outlay therefore may be more or less same as last year.
- 5 For a survey of empirical works on inflation in India, see, Bhattacharya and Lodh (1990).
- 6 The forecasting efficiency of the budget is examined in Bhattacharya and Anita Kumari (1988).
- 7 This result is confirmed by counter-factual simulation with macro-econometric models by Bhattacharya (1984) and Krishnamurthy and Pandit (1985).

The Budget and Its Relevance for 'Restructuring the Economy'

Arun Ghosh

The greatest failing of the budget for 1991-92 is that there is no progress towards decentralisation. Together with the danger that in the totality of the revenue and expenditure proposals, we may not succeed in achieving the macroeconomic balance that is urgently necessary, the budget—in association with other economic policies—may end up only imposing increased hardship on the common man, instead of restoring balance (and confidence) in the economy.

What we need most urgently today is to make a serious effort to equate domestic saving with domestic investment, for which we need a two-pronged thrust: (a) a more purposive attack on the 'dissaving' by government administration by raising more taxes and by improving the functioning of government enterprises; and (b) an attempt to increase the savings of the community by stimulating 'local area planning' through devolution of both authority and finances.

SO much has already been written about the budget and the other elements of the 'package' of economic policies that the reader is certain to find considerable repetition of points made earlier, even in the *EPW*. Nonetheless, a focus on the relevance of the budget for the 'restructuring' of the economy is necessary even at the cost of repetition. The question that needs to be asked is: what is the pattern of 'restructuring' that we are seeking, what sections of the population does it purport with a vision of peaceful growth of the diverse peoples of this country, are they consistent with the growth of a democratic polity?

The *Economic Survey*, which precedes the presentation of the budget, has of late been giving an increasingly fair indication of the problems faced by the economy. Take, as the starting point, the following statement which occurs in the *Economic Survey 1990-91*: "Macroeconomic imbalances characterised by high fiscal deficits and a growing revenue deficit have continued to remain a major source of concern for the government during the past few years" (emphasis added). This concern has been expressed in every *Economic Survey* presented over the past few years, but unfortunately the same concern has not been reflected in the fiscal management of the country by the central government.

Consider the following facts. The revenue deficit of the central government was 0.6 per cent of the GDP in 1980-81, and increased to 1.5 per cent of the GDP in 1984-85. By 1986-87 (during the Seventh Plan) this deficit had jumped to 2.7 per cent of the GDP, and continued at this high level all through the Seventh Plan period. In 1990-91, the revenue deficit of the centre had increased to a staggering 3.4 per cent of the GDP.

As per the National Accounts Statistics, gross domestic investment exceeded gross domestic saving by 2.8 per cent of the GDP in 1988-89, and by 2.4 per cent in 1989-90. The euphoria of a high growth rate of the GDP in the Seventh Plan period seems to have blinded us to the stark reality that no individual, no country can go on living

beyond its means for ever. One recalls in this context the howls of derision which greeted the announcement by the erstwhile Planning Commission under Ramakrishna Hegde that the Eighth Plan would be drawn up on the assumption of a GDP growth rate of 5.5 per cent per annum (even though the actual GDP growth rate achieved during the Seventh Plan has turned out to be 5.6 per cent).

Against the above background, it is unfortunate that in a television interview on the night of the budget, the finance minister should have blamed his two predecessors (Madhu Dandavate and Yashwant Sinha) for leaving the finances of the country in a mess. The crisis as stated by even the present governor of the Reserve Bank of India (reported in *The Economic Times* of May 8) has been in the making for about a decade.

While this point has been made earlier (in this column), it needs to be repeated that the crisis has really been accentuated since 1986 or thereabouts, following misconceived policies like virtual freedom for foreign collaboration associated with import liberalisation—leading to an import intensive pattern of industrialisation catering to the demand for elitist consumer goods and more particularly, the pursuit of grandiose, capital intensive schemes to the neglect of an employment oriented approach to development. Guided, in fact goaded, by the World Bank, we not only started borrowing heavily from abroad, we started relying primarily on short-term borrowings for our development programme—a fact glossed over in the *Economic Survey*. Consider the accompanying figures, taken from the *Reserve Bank Bulletin* for July 1991, which bring out our growing dependence on short term borrowings in recent years (Table 1). The *RBI Bulletin* gives no details (or explanation) of items that constitute 'other capital (net)'. It is possible that a large part of this inflow is made up of borrowings of less than one year maturity (obtained by institutions like the State Bank of India, on the assumption that these debts would

be rolled over). This, however, is only a conjecture.

It is to be noted that even excluding 'other capital (net)' and taking only commercial borrowings and non-resident deposits (which total Rs 3,123 crore in 1987-88, Rs 5,208 crore in 1988-89 and Rs 5,041 crore in 1989-90), short-term borrowings were 41.7 per cent of total capital inflow in 1987-88, 50.5 per cent in 1988-89, and 48.6 per cent in 1989-90. If 'other capital' is really made up of essentially short-term flows, the percentage of short-term borrowings in 1989-90 would be above 70.

The clue to the balance of payments crisis is, thus, neither the Gulf war nor sudden mismanagement of the economy. Even without the Gulf war, the country was heading for trouble; the Gulf war merely hastened the crisis. This point is being emphasised because a 'structural readjustment' is now obviously necessary, but the structure of the economy that we foresee as the answer to our problems has to take note of some of the basic maladies that have plagued our economy. The country really and truly needs a basic structural transformation, and not the type of pseudo-industrialisation that was pursued during the 80s.

It is particularly important to recall in this context that as per the National Sample Survey, over the period 1983 to 1987-88, overall employment growth was no more than 1.55 per cent per annum (when population was growing at more than 2.1 per cent). Indeed, employment in organised private industry recorded a decline between 1980-81 and 1988-89. Again, as per the National Sample Survey data on household consumption expenditure, analysed state by state by B S Minhas and L R Jain (of the Indian Statistical Institute) and S D Tendulkar (of the Delhi School of Economics), on an all-India basis, 45 per cent of the rural population was below the poverty line in 1987-88; and if 20 major states are taken into consideration, the percentage goes up to 49. Seven states (U P, Bihar, West Bengal, Maharashtra, Madhya Pradesh, Tamil Nadu and Orissa) accounted for 201 million poor

NATIONAL INSTITUTE OF ADULT EDUCATION

NEW DELHI

(An autonomous Institution under Govt of India)

Invites applications for three posts of Research Fellow

Scale of pay: A person appointed as Research Fellow may enjoy his/her scale of pay with 20% research fellow allowance or he/she may be placed in one of the following scales of pay

Rs 2200 75 2800 100 4000 (Category A)

Rs 3700 125 4950 50 5700 (Category B)

Rs 4500 125 5700 200-6300 (Category C.)

Job requirement: The Research Fellow will be expected to participate in providing academic and technical resource support in the implementation of adult education programme among others in the area of (a) Human Resource Development (b) Learning and Curriculum, (c) Media and Communication, (d) Research and Evaluation, (e) Comparative Studies, (f) Foundations of Adult Education, (g) Management and Planning, and (h) Documentation

Educational qualifications for direct recruitment:

(a) For Research Fellows in the scale of Rs 2200 4000

Very good academic record with at least 55% marks or an equivalent grade at Master's Degree level in Adult Education or allied subjects with evidence of active work in adult education or allied spheres as student or thereafter

(b) For Research Fellows in the scale of Rs 3700 5000

Uniformly very good academic record with a doctoral degree or equivalent published work. Evidence of substantial contribution to research and scholarship as evident by the quality of publication, contribution to educational innovation design of new courses and curriculum. About five years experience (excluding period spent in obtaining Ph D Degree) of teaching and/or research

OR

Uniformly very good academic record with at least three years experience in research/innovation oriented activities in adult education or allied spheres with at least five years experience (excluding period spent in obtaining Ph D Degree) of teaching and/or research

OR

Uniformly very good academic record with at least three years experience in research/innovation oriented activities in adult education or allied spheres with at least five years experience at senior level in education or rural development or administration of which at least three years should be in adult education or allied spheres

(c) For Research Fellows in the scale of Rs 4500 6300

A scholar with published work of good quality and about ten years experience of teaching and/or research,

OR

A scholar in adult education or allied subjects with at least three years experience in research/innovation oriented activities and about five years of experience of work in adult education or allied activities at a senior level,

OR

Uniformly very good academic record with at least seven years experience in a senior position in education or administration or rural development out of which at least three years experience should be in adult education or allied spheres

Age for direct recruits preferably below 40 years (relaxable in exceptional cases)

The recruitment to the post of Research Fellow is **tenurable** for a period of **two years** and extendable upto 3 years

For deputation (including short-term contract) Persons holding analogous posts in universities/institutions of higher learning/research,

OR

Persons fulfilling qualifications and experiences for direct recruitment

APPLICATIONS be sent to the REGISTRAR, National Institute of Adult Education, 10-B, Indraprastha Estate, New Delhi-110002 latest by **20th September 1991** on plain paper

in the rural areas. (For the urban areas, the percentage are 37 and 38 per cent, respectively.) (See B S Minhas, L R Jain and S D Tendulkar, 'Declining Incidence of Poverty in India: Evidence versus Artefacts', *EPW*, July 6-13, 1991, p 1673.) Most of the rural population below the poverty line in rain-fed areas and at the all-India level, some 100 million hectares out of the total cultivated area of 180 million hectares, stand 'degraded', with very low productivity of the land. Crises which appear to be the major concern of people in New Delhi do not affect this population except insofar as the fiscal crisis leads to cutbacks in programmes intended for this segment of the population, seeking to provide employment or minor irrigation, or the development of sericulture, handloom cloth production, etc. The 'structural adjustment' of the economy that we attempt has to be addressed not only to the crisis in the balance of payments but to the deepening longer-term crisis of increasing unemployment and low productivity of a large section of the population, primarily in the rural areas.

The crisis in India today is, at one level, an acute fiscal and balance of payments crisis; and at another level, growing unemployment, growing imbalance in regional growth, and increasing social tensions arising therefrom.

Perhaps it needs to be reiterated in this connection that both development programmes and stabilisation programmes can be rendered inoperable by growing social tensions which are essentially a reflection of the growing economic inequalities and imbalance in the country. The finance minister has acknowledged as much, and has prefaced his budget speech by calling it an attempt at 'adjustment with a human face'. After all, the central government budget remains the most potent instrument at the command of the authorities for tackling the problems facing the country. And yet, it is easy to forget that the 'adjustment process' must help, and not ignore the interests of the poor. We must remember this while reviewing the budget because, living in towns, we are all overly obsessed by the external transactions of the economy. We from the middle classes are not really concerned with the effect of our policies on the majority of the people. The media appear to be generally concerned with

the future of the little world of the educated elite, the upper middle classes living in the metropolitan areas, not even the small towns.

THE BUDGET

The budget for 1991-92 has to be examined from three angles. First, does it seek to restore overall balance (between aggregate supply and demand in the economy)? In this context, one has to look at the revenue deficit, the overall budget deficit, and the impact of the budget on private demand and supply. Does it create a problem on the balance of payments front? For there is no 1:1 relationship between the budgetary deficit and the balance of payments deficit, though the budgetary deficit can create balance of payments problems if it leads to aggregate demand in the economy to surpass aggregate supply. It would be unfortunate if the short-term solutions to the problem do not mesh into the medium-term policies that we need to adopt—in any case, the finance minister says that it will take a few years to restructure the economy—and the medium-term policies must mesh into the longer term strategy, which in turn must be based on the vision and perception we have of the process of growth of all the peoples of this country.

Secondly, the budget has to be analysed from the angle of the manner in which resources—via taxes—are raised. Is the pattern of resource raising equitable? What is likely to be the impact of the resource raising effort on prices? on savings generally? on the distribution of income and therefore the pattern of demand?

Finally, the budget has to be seen from the way expenditures are allocated. What is the extent of current consumption expenditure, of socially useful development expenditure, of capital formation in infrastructure facilities and other essential services? What is the redistributive effect, if any, of the budget? (This applies to both revenue raising and the pattern of expenditure.) What is the extent to which the criteria of economy and efficiency are applied to expenditures by the central government? In the last context, what is the extent of devolution of responsibilities (and of funds) for social development expenditures? For, it is a well known axiom in public finance that while revenue

collection is by and large best done centrally (so as to avoid irritants to commerce like the 'octroi' or entry or exit taxes), the delivery of social services is best organised in a decentralised manner, by the local authorities. One knows, for instance, that attendance by teachers in primary schools improved dramatically in Karnataka when the administration of primary education and primary health was handed over to the Mandal panchayats. One knows also that, as of today, different agencies and organisations of the central government are separately and independently attempting to reach down to the people, spread over more than five lakh villages and around a thousand urban areas (quite a few of them little better than overgrown villages with no urban facilities). The criterion of 'efficiency' requires in this context the 'convergence of services' by local authorities/agencies, so that services like health and sanitation, maternity and child care, and even primary education for very small children could be rendered by the same (local) agency, thereby increasing the efficiency of these services, and making such services more widely available (without any large increase in expenditure).

What, in brief, is the extent of devolution of funds from the centre, which is cardinal to the principle of decentralisation of services?

OVERALL BALANCE

One must accept that the budget—if all the budgeted numbers turn out to be correct—seeks to commence the process of restoring the balance between aggregate demand and supply in the economy, through a substantive reduction in both the revenue and the overall budgetary deficits. No one would recommend that from a level of 3.4 per cent of the GDP in 1990-91, the revenue deficit should be brought down to zero in one fell swoop. That would usher in an unprecedented deflation in the economy. The revenue deficit is to be brought down from Rs 17,585 crore in 1990-91 (Revised Estimates) to Rs 13,584 crore in 1991-92. That is a substantial decline, if it can really be managed. The GDP in 1989-90 was of the order of Rs 4,430 billion. Assuming an increase of 5 per cent in real terms and a price increase of 12 per cent over the year (as stated in the *Economic Survey*), the GDP in 1990-91 (at current prices) may be estimated at Rs 5,183 billion. (This figure is roughly confirmed by the estimate of the revenue deficit in 1990-91 being 3.4 per cent of the GDP, as per the *Economic Survey*.) The finance minister has stated that real income in 1991-92 would grow by 4 per cent and price increase limited to some 9 per cent. At this rate, the GDP at current prices would reach the figure of Rs 5,857 billion; and the projected revenue deficit of Rs 13,584 crore would come close to 2.4 per cent of the GDP in 1991-92.

The overall budgetary deficit which leads

TABLE 1. INDIA'S OVERALL BALANCE OF PAYMENTS

| | 1987-88 | 1988-89 | 1989-90 |
|--------------------------------|-----------|------------|------------|
| 1 Current account (net) | (-) 6,293 | (-) 10,410 | (-) 10,391 |
| 2 External assistance (net) | 2,928 | 3,210 | 3,054 |
| 3 Commercial borrowings (net)* | 1,283 | 2,743 | 2,866 |

NEW INDUSTRIAL POLICY

SALIENT FEATURES

Gujarat has announced its new Industrial Policy, offering package of incentives to boost the industrial growth in the State. The new package offers Capital Investment Subsidy, Sales Tax benefits, incentives to Employment Oriented Industries, Pioneer Unit Incentive, Prestigious Unit Incentive and Special Incentive for setting up 100% Export Oriented Units. The new policy also offers special incentives to electronic industry.

The salient features of the new incentive package are as below.

- ★ Additional incentives to employment oriented industries
- ★ Special incentives for setting up 100 per cent Export Oriented Units
- ★ Incentive Scheme for prestigious units.
- ★ An attractive offer for the development of electronics industry
- ★ Incentives for rehabilitation of sick industrial units
- ★ As many as 140 out of 184 talukas are made eligible to avail benefits under Incentive Package
- ★ 8 Special backward areas are made eligible for incentives.
- ★ A number of measures announced for promotion of cottage, village and tiny sector industries
- ★ The tiny sector units have been separated from small scale industries and are offered incentives at higher rate.
- ★ The policy offers attractive schemes for the small, medium and large scale units
- ★ The definition of fixed assets liberalised
- ★ The pioneer unit incentive scheme made more attractive
- ★ Incentives offered for existing units undertaking expansion or diversification.

Industry Status for Tourism

The new Tourism Policy announced recently by the Chief Minister Shri Chimanbhai Patel giving tourism the status of an industry makes it eligible for certain concessions and reliefs in some taxes and financial assistance like that given to other industrial units.

The new Tourism policy, was made effective from January 1, 1991 to make it a new year gift.

The tourism industry has been divided into three categories—A, B and C—and different norms of incentives have been fixed for these categories. In category A there are 50 places of tourist and historical interest while category B is for wayside facilities on state and national highways.

The maximum relief has been provided in category C which has been reserved for the setting up of amusement parks, water sports including boating and ropeways. These facilities would be fully exempted from entertainment tax for the first six years.

The main purpose of this policy was to promote tourism in the State on the pattern of Haryana International airport at Ahmedabad would further promote tourist traffic to the State.

The concessions for hotels and motels would not remain restricted to the private sector only, but joint sector units, with the Gujarat State Tourism Corporation, would also be entitled for the benefits.

The State Government had decided to bear half of the tuition fees of the students taking up courses in hotel management.

Under the policy, a hotel or motel set up within 5 km. of the notified 50 places would get full exemption in sales tax on the food served, 40 per cent concession in electricity duty and 50 per cent exemption in luxury tax. All these incentives will be given for the first six years only.

In the second category of hotels and motels on the wayside, exemption in sales tax would be 50 per cent, in electricity duty 25 per cent and in luxury tax 25 per cent. These incentives would also be for the first six years. These facilities should be within 1.5 km. of the State and national highway.

A committee under the Chairmanship of the Secretary, Information, Broadcasting and Tourism Department has been set up to fix the qualifying norms of facilities for the motels and hotels so that they could avail of the concessions.

Government of Gujarat

to the creation of additional reserve money (through government borrowing from the Reserve Bank of India) leads to an increase in money supply directly, and thereby causes an inflationary impact on the economy when aggregate demand is already in excess of aggregate supply. This overall deficit is likely to be Rs 10,772 crore (or 2.1 per cent of the GDP) in 1991-92 as against Rs 7,719 crore (or 1.3 per cent of the GDP) in 1990-91, a really significant decline if it can be achieved. The new fangled concept of the 'fiscal deficit' is in a sense confusing because while government borrowing from the private sector withdraws part of private saving, government lending to the private sector (through public financial institutions) compensates for it and augments private savings available for investment. (See, in this context, I S Gulati, 'Reducing the Fiscal Deficit: Soft and Hard Options', *EPW*, July 20, 1991.) Even so, using this IMF favoured concept, the fiscal deficit (Rs 37,727 crore) works out to 6.4 per cent of the above projected figure of the GDP (though this deficit is stated by the finance minister to be 6.5 per cent). Again, on the assumptions made earlier, the decline in the fiscal deficit would be from 8.3 per cent of the estimated GDP of Rs 5,183 billion in 1990-91.

The precision of the above estimates cannot be pushed too far; they are based on certain assumptions regarding GDP growth and the anticipated price changes. On the face of it, the pace of slow down of the revenue and budgetary deficits would appear to be reasonable; but in fact, are they? Also, can the finance minister stick to these budgeted figures?

As has already been highlighted in *The Economic Times*, most of the expenditure estimates for 1991-92 are a repetition of the estimates presented in March 1991 by Yashwant Sinha for purposes of obtaining a 'vote on account' for four months. In fact, whether by oversight or in a hurry, Annexure 7 of Volume I of the Revenue Budget gives an estimate of the 'Strength of Establishment and provision therefor'. The estimate of staff strength remains unchanged from the March budget, namely, 42 lakhs in March 1992 as compared to 41 lakhs in March 1991. There is not only to be no retrenchment but addition to staff strength by 2.5 per cent over the year. How is this consistent with the promised reduction in revenue expenditure (other than interest payment) by 4.9 per cent over the year?

It is, of course, possible that in a hurry to cobble together the budget for 1991-92—so as to lose the minimum amount of time for raising tax revenues for the year—the finance minister did not have time to go through the detailed budget of each ministry/department. Nor is the finance minister expected to go through every detailed figure in the budget papers; and the increase in staff strength may not actually materialise. Nonetheless, it is curious that in the Revenue Budget, volume I, the proposed expenditure by broad categories re-

mains generally unchanged from the figures indicated in March by Yashwant Sinha. The most startling is the proposed expenditure in 1991-92 of the Ministry of External Affairs, which remains unchanged despite the devaluation of 20 per cent in the value of the rupee in July. How will our embassies and foreign missions function unless it is proposed to close down some of them? One is left wondering as to whether the budget estimates are realistic, and as to how, in fact, the finance minister proposes to bring down administrative expenditures in the revenue budget (other than on interest payments) by 4.9 per cent over 1990-91. In the absence of an indication of the game plan, particularly whether there is to be retrenchment of staff, or the impounding of dearness allowances—there is not even a mention that there would be a temporary halt on the use of the Leave Travel Concession—one would be forced to conclude that either there would occur considerable retrenchment (which is not being overtly admitted), or the revenue expenditure would not be contained to the budgeted figures. One cannot say that the staff needs of agencies like the CCIE and the DGTD would remain the same, after the sweeping changes introduced in the licensing/trade control regimes. But the matter does not appear to have been thought through. There is no clear programme for the redeployment of surplus staff. And the size of the council of ministers and the penchant of ministers to order alterations in their offices/residences does not set a good example for austerity or economy in respect of administrative expenditures.

In fact, there is some danger that even as we go on proliferating the number of ministries/departments of the central government—and increasing the number of senior bureaucrats—the axe will fall on the doubtless redundant staff in organisations like the CCIE/DGTD/Iron and Steel Control, without any plan to redeploy the personnel. But there is so much other work to be done. To take but one example, it is well known that of late, exporters are keeping back their foreign exchange earnings in expectation of further devaluation. One estimate places such delayed remittances at some \$ 2 billion (the amount we are seeking from the IMF today). The Reserve Bank of India gets a copy of the export documents from the customs, but there are millions of them stored away, because the RBI does not have the personnel to check whether remittances against such documents have been encashed. The large number of officers and staff in the organisations mentioned earlier could be deployed to take up this task of checking, under RBI supervision. But nobody is bothered, and jurisdictional prerogatives are unlikely to make this a possibility. The surplus staff would remain surplus; meanwhile, vital new tasks would not be undertaken.

It is this lack of clarity in regard to the precise manner in which the revenue deficit is to be brought down which causes deep

unease. Could we not have raised larger resources by way of direct taxes? Was another appeal to tax evaders to come clean necessary? Is it all that difficult to pinpoint people who are evading taxes, who reside mainly in big towns and cities? In metropolitan areas, at any rate, the tax evader has of late started flaunting his wealth unabashedly; it is not difficult to pinpoint quite a few of them.

The trouble is, some of the big tax evaders wield enormous political clout, and an income tax officer would be really afraid to nail them down in the present atmosphere of secret patronage, lack of openness in governance, and arbitrary, *ad hoc* promotions/demotions, even incarceration, of civil servants. We want to opt for a market oriented capitalist system without observing some of the ground rules of the capitalist system. (That we have never encouraged competition is part of this ethos.) In the US, a tax evader—no matter who he is—is sent to jail. A former vice president of the US, while he was still in office, was indicted for tax evasion, had to resign in ignominy and had to obtain a presidential pardon to avoid going to jail. Have we ever taken such a drastic step? Maybe our tax laws need an amendment. But the finance minister could have announced that he is introducing a bill which would empower the tax authorities to send any tax evader—even those who have held high office, for instance—to jail (with hard labour, and not as a class I prisoner). And a dozen prominent persons sent to jail would have sent the correct signals to those who evade taxes and yet openly flaunt their wealth. Maybe not every small tax evader would get caught, but two resolute actions—one, the actual purchase of urban property by the government at 10 per cent more than the officially declared price, a power which already exists; and secondly, conviction and jail terms for a few prominent persons for tax evasion—would have had salutary effects. A lot of evaded income taxes would have got paid, with penalty where due, and the salaried person would not have complained that he is among the few who have to pay the income tax. Furthermore, an incidental effect of such action would have been to render black money into an idle 'hoard' and, therefore, without an adverse impact on the economy, for all practical purposes. That would have stopped the spiral of price increase, and in that event, the deficit (as planned now) would not have led to any price increase. There would still have occurred some increase in prices because of devaluation (and costlier raw material imports), excise duties and higher administered prices. But it is possible that a simultaneous drive for greater efficiency and higher productivity may have helped to keep the price increase down significantly. In fact, people's response to appeals for austerity, for greater efficiency and productivity depends on the general atmosphere of austerity and efficiency. The example set by the leaders can make a lot of difference to

the functioning of the economy

Indeed, with the type of crisis that we are facing, why can the surcharge on the income tax not be raised? Why do we have to have a multiplicity of exemptions which make the effective rate of tax quite low for the affluent sections of the people?

And now, with the possibility of a partial failure of the monsoon, particularly in the northern states, there could arise distress in some of these states, the need for increased relief expenditure, and certainly an increase in food subsidy by extending the PDS to the rural poor (Punjab, Haryana and western UP are protected by irrigation, but not the other areas). The budget proposals may not be able to keep down price inflation below double digit figures during 1991-92. And the budget does *not* inspire confidence that it will either be able to hold down prices or even protect the employment and income of the masses of rural people who in any case face underemployment for most part of the year. We should have taken bold steps to augment revenues through direct taxation in this year of crisis.

One of the problems in attacking tax evasion is that many prominent persons may find it difficult to explain how they came to acquire assets well beyond their known sources of income—a criterion often applied selectively for some civil servants—and how they can afford the living style that one sees flaunted openly, publicly. Has any income tax officer ever queried the people who throw lavish wedding parties, with thousands of guests, in five-star hotels? Also, in the same context, there is now a widespread trend of personal expenditure being shown as business expenditure. Business entertainment is only one of them. There is need for stricter norms in regard to 'deductions' of business expenditure from income, for purposes of calculation of the taxable income.

Briefly, and to repeat, it would be a good thing if a large part of untaxed money is suddenly driven underground and becomes an idle hoard. There would doubtless be a reduction in some economic activity as a result, particularly in many urban areas. Equally, there would be less money available for speculative purchases of crucial items of common consumption by hoarders. For, given the will to do so, such hoards can also be unearthed, at least in urban areas.

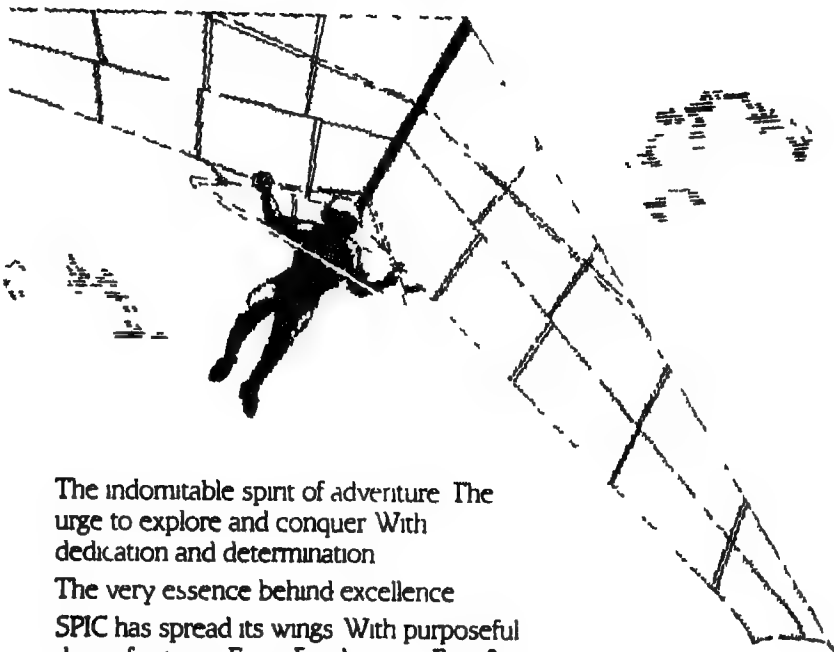

It is necessary perhaps to only mention the abject surrender, recently announced, in regard to the proposed hike in fertiliser prices. Only two points need to be made in this connection. First, the proposal to exempt small and marginal farmers from the price hike could lead to large-scale corruption in the distribution of fertilisers in the absence of democratic decentralisation and the system of distribution being entrusted to democratically elected people's representatives, and small and marginal farmers may not really get the benefit of the concession. Unfortunately, all political parties are guilty of pandering to the farm lobby in this con-

text. Moreover, the reduction in savings in the total subsidy appears to be grossly underestimated. Secondly, if we surrender on this front, can we hope to stem the losses of the state electricity boards through the virtually free supply of electricity to the lucky farmers served by power supply? How can we save the mounting losses on electricity and irrigation water supply? And if we cannot do so, how can we increase the resources available to the state governments?

Thus, the revenue deficit (as well as the overall budget deficit) could have been brought down further. In any case, we need more revenues to keep the revenue budget

deficits down to the levels planned, for the budget estimates of expenditure appear to be understated. Also, as we would note later, there is need for greater employment generation, particularly in the rainfed areas where the monsoon may play truant this year. We really need a massive employment guarantee programme even to achieve a structural transformation of the economy, for which we are supposedly 'adjusting'. But a discussion on this issue must wait, though it needs to be reiterated even at this stage that the combined effect of devaluation, failure of the monsoon, and a budgetary deficit which appears to be based on underestimation of

'adjustment programme' which has been hastily put together without proper examination of the implications of many of the steps taken

REVENUE

We have already partly discussed the revenue side of the budget in the context of the overall budget balance. Perhaps the finance minister has also underestimated the revenue. To begin with, without taking credit for raising the corporate tax rate, the revenue from corporate taxes seems to have been understated. The revenue budget indicates the receipt from corporate taxes to be Rs 5,400 crore in 1991-92 against Rs 6,350 crore in 1990-91 (RE). This is inexplicable. Also underestimated is the collection from the removal of tax exemption of 'investment trusts', which was a neat ploy adopted by many big businessmen. Business circles estimate the tax collection from this source at Rs 400 crore, and not Rs 25 crore for which credit has been taken in the budget. The reason for these underestimates could be abundant caution, or the desire to show better performance than budgeted indicating greater vigilance. The fact remains that the budget must always give the best possible estimate of revenues and expenditure and this does not appear to be the case in the 1991-92 budget.

Unfortunately, while some 'exemptions' are being reduced/tightened, new types of exemptions are now being introduced. As it is, many of the private 'trusts' are now being used increasingly as private tax shelters. We now have a proposal for income tax concession "for financing schemes for meeting urgent needs of the people". Should the government not be meeting the urgent needs of the people? The government of India is afraid of even considering implementing the Right to Work—which implies essentially, the right to provide eight hours of physical labour at the minimum wage—and at the same time permits the proliferation of untaxed incomes, which has resulted in growing inequality in the distribution of income. The attack of international institutions (the IMF and the World Bank) is always on overt subsidies, some of them meant for the poor, e.g. the food subsidy. And our ruling elite is also inclined the same way, while ridiculing the notion of the employment guarantee scheme. As per calculations made by Sudipto Mundle and Govind Rao of the National Institute of Public Finance and Policy, in 1987-88, between the centre and 14 major states, total subsidies accounted for some 14 per cent of the GDP, of which overt subsidies on food, fertilisers and export promotion were but a small fraction (see, *EPW*, May 11, 1991).

The flat increase in excise duties on all items, following upon the hike of railway freight rates and passenger fares, is likely to impinge heavily on the poor. These measures would also contribute to inflation. The in-

crease in the price of petrol is likely to accentuate the tendency to displace passenger vehicles which would be bad for the economy because we are heavily deficit in diesel oil which is required to be imported in addition to crude oil. The increase in the excise duty on luxury consumption goods is really marginal. All in all, the revenue effort through taxation is not really much, and recourse to indirect taxes makes the tax structure even more regressive. Direct taxes account for no more than 10 per cent of total government receipts (including borrowing and deficit finance) whereas indirect taxes and non-tax revenue account for 53 per cent of government receipts. The reduction in the deficit of the government is really brought about by the sale of a part of the equity of profitable public sector enterprises, which ought to be treated as a capital receipt and not a revenue receipt. It reduces the fiscal deficit but not the revenue deficit. The sale of assets would reduce the future flow of income to the public sector.

There is therefore a clear case for an effort at larger resources raising through direct taxes.

EXPENDITURE

It is really the expenditure side of the budget which deserves careful attention because government expenditures, transfers and capital formation constitute a means of promoting both social welfare and social development. One has also to worry about the effectiveness and efficiency of government expenditure, and the solution to inefficiency is not the abandonment of the role of government but improving its efficiency and performance through effective monitoring and performance audit of all expenditures.

Consider in this context the pattern of government expenditure in 1990-91 (revised) and 1991-92 (budget), as summed up in Table 2. The savings effected by the finance minister are (a) Rs 435 crore by way of non-Plan loans to public enterprises, (b) Rs 400 crore of fertiliser subsidy, and (c) Rs 451 crore in various non-Plan outlays other than interest payment. The second of the above is now out, and one is not sure whether (a) and (c) would really materialise, but we have discussed the issue earlier. Incidentally, the fertiliser subsidy has been getting out of

TABLE 2 CENTRAL GOVERNMENT EXPENDITURE

(Rs crore)

| 10 Total central budgetary support to central plan | 17594 | 19015 | 1421 |

Source: Budget papers July 1991-92

hand because of the cost *plus* formula accepted by government; and the solution to the problem has been discussed at length in this column earlier. Incidentally, if the fertiliser price hike is reduced from 40 to 30 per cent, and if roughly one-third of the total supply of fertilisers is made available (to small and marginal farmers) without any price increase, the additional expenditure should be much higher than announced by the finance minister.

(*Postscript:* As of going to the press, we hear of the refusal of the states to implement the revised policy because they realise that the cost would be substantially more than the Rs 405 crore allowed by the finance minister.)

The real issues which nobody appears to be bothered about, however, are: (a) Why do we have to increase the budget for the police when all other administrative expenses are being cut? (b) Non-Plan loans to public sector enterprises (PSEs), are really a way of covering up their losses, and it would be good if this covert subsidy could be entirely eliminated. But this cannot be done suddenly, offhand, without careful restructuring of the public enterprises. Some other questions also arise in this context. In 1990-91, there was an allocation of Rs 22.50 crore (RE) for 'Implementation of Labour Rehabilitation Scheme' for which the provision in 1991-92 is zero. Is this wise? Particularly in the context of the steep reduction in the non-Plan loan to the Hindustan Steel Works Construction from Rs 36 crore to Rs 9 crore and of the DTC from Rs 120 crore to Rs 35 crore? The question arises as to whether such provisions are realistic. If the DTC is required to raise its fares, it will hit the common man, because public transportation is really used by the poorer sections of the population. Incidentally, there is genuine need to restructure the PSEs. Why does the government not come out with a White Paper on PSEs? Two drafts of such a White Paper exist, one prepared by the Rajiv Gandhi government, and the other, a revised paper prepared by the V P Singh government. The Industrial Policy Statement is not adequate in this context; and instead of mixing up the good, the indifferent and the bad PSEs and lumping them all together and issuing general statements about over-manning and inefficiency, we should segregate them. Many of them suffer from poor management, and the latter can be traced back to the exercise of authority (without responsibility) by both politicians and bureaucrats. The MOU is *not* an effective answer; and in any case, MOUs have been finalised only for a handful of enterprises. To this extent, the idea of selling part of the equity of PSEs to workers and private persons (with a ceiling on individual holding) is desirable *not* only for profit-making PSEs but *all* PSEs. (In the process, the equity of some may have to be sold at a discount, which would be a good thing in that the *capital of some PSEs needs to be written down*. This is perhaps the first

prerequisite to the functioning of the capitalist system.) In any case, what precisely is the game plan of the government in regard to the loss-making PSEs? (c) Thirdly, savings of Rs 1,266 crore (mainly in respect of write-off of loans to states which was a heavy expenditure item in the 1990-91 budget, arising from a recommendation of the Ninth Finance Commission in this behalf, as well as the unusual expenditure incurred for evacuation of Indians from the Gulf area) are fortuitous, and again highlight the inadequacy of the total effort made to reduce the overall budget deficit (in the context of the near bankruptcy in external payments), and therefore the inadequacy of the effort at direct taxation. (d) The budget makes no progress in the matter of decentralisation

and the devolution of funds, and therefore in the efficiency of public expenditure. Other than *statutory transfers* or those made as per the recommendations of the Ninth Finance Commission (or transfers such as to MP for Bhopal Gas tragedy victims), the total transfers to states, as well as 'recoveries' from states over 1990-91 and 1991-92 are briefly indicated in Table 3.

In a sense, the central loans to states against small savings should have been excluded from the figures of central assistance to states, but this item needs to be shown because 'recoveries' include recoveries of (and interest on) loans against small savings.

It would easily be seen that direct central assistance to states is considerably exceeded by budgetary allocations for the central plan.

NATIONAL INSTITUTE OF ADULT EDUCATION NEW DELHI

(An autonomous Institution under Government of India)

1. Invites application for two posts of Fellows in the pay scale of Rs 3700-125-4950-150-5700

2. Job requirement

The fellow will be expected to participate in providing academic and technical resource support in the implementation of adult education programme among others in the areas of (a) Human Resource Development; (b) Learning and Curriculum; (c) Media and Communication; (d) Research and Evaluation; (e) Comparative Studies (f) Foundations of Adult Education; (g) Management and Planning; and (h) Documentation.

3. Educational Qualifications for direct recruitment:

Uniformly very good academic record with a doctoral degree or equivalent published work. Evidence of substantial contribution to research and scholarship as evident by the quality of publication, contribution to educational innovations, design of new courses and curriculum. About five years experience (excluding period spent in obtaining Ph.D degree) of teaching and/or research

OR

Uniformly very good academic record with at least three years experience in research/innovation oriented activities in adult education or allied spheres, with at least five years experience at senior level in education of rural development or administration, of which at least three years should be in adult education or allied spheres.

4. Age for direct recruits is preferably below 50 years and is relaxable in the case of persons possessing exceptionally high qualifications or experience in the area of adult education.

5. For deputation/transfer.

Persons holding analogous posts in Universities/Institutions of higher learning/research or persons fulfilling qualifications and experience prescribed for direct recruitment.

Applications be sent to the Registrar, National Institute of Adult Education, Block No.10-B, Indraprastha Estate, New Delhi-110002 latest by 20th September 1991 on plain paper.

It may also be added that the budget papers seek to confuse the lay reader because different tables in volumes I and II of the Expenditure Budget give different figures of plan outlay and central assistance. This is because of the enormous central intervention today in fields of activity which, under the constitution, are clearly the responsibility of the states, but central schemes and centrally sponsored schemes predominate in these areas, and in a way compel the states to make 'matching' contributions for the centrally sponsored schemes. These allocations are shown as part of central assistance for state plans.

As is well known, much of the central outlay on such schemes is spent on the 'delivery' of the requisite services. The expenditure on central and centrally sponsored schemes increased from 5,165 crore in 1990-91 (revised estimate) to Rs 6,483 crore in 1991-92 (budget) for the states, excluding the union territories with legislatures (for which such outlays increased from Rs 86 crore to Rs 104 crore). Thus, the increase in the outlay on central and centrally sponsored schemes for the states increased by as much as Rs 1,318 crore over the year, more than the increase in the net assistance to the states—which, as seen earlier, increased by only Rs 1,267 crore over the year.

It is in the above context that one has to consider the efficiency of central government outlays, since, as stated earlier, the delivery of social services is best arranged at a decentralised level, and yet the budget for 1991-92 evinces greater centralisation rather than decentralisation.

RESTRUCTURING THE ECONOMY

The restructuring of the economy has to start with improving the productivity of the land, which calls for a massive programme for local area development. Restructuring would also call for increasing the *average* productivity of the workforce which would involve gainful employment for all those who are currently unemployed/underemployed. Both the above objectives can be combined by making provision for increased employment—through an employment guarantee scheme—of people for local 'watershed' area planning, which would involve a massive programme of land re-shaping, land levelling, tree planting, and diverse works to improve the moisture retention capacity of the soil in rainfed areas (or improved drainage of water in some other areas), together with small irrigation works, creation of a small weir or check dam here, a tubewell there, deepening ponds and lakes where possible, bunding and terracing the land where necessary.

In urban areas, there is again need for massive construction of urban facilities like sewage, roads, proper housing, removal/improvement of slums, provision of safe drinking water to all (in both urban and rural areas).

All these require massive inputs of labour. They cannot be directed centrally, nor even

from state headquarters. What is required is local area planning by village panchayats and urban municipalities, for which there is need for devolution of finances and assistance by way of support by technical people to the village panchayats, so that agrarian (and other) developments may be carried out scientifically. Such a programme would require (a) massive devolution of both authority and finances, and (b) the generation of a higher rate of saving within the economy.

The latter is easily possible, for people would be enthused to save provided they see such savings as a way of improving their own living standards. An easy way would be to give incentives by way of devolution of funds provided local savings are generated (e.g., by way of provision of labour for area development, which would increase the rate of domestic saving/capital formation). In other words, we go back to the Nurkseian concept of using idle labour to increase capital formation, through a massive works programme.

Such a programme would help to restructure the economy, but there is no hint of such a programme in the budget or in any of the other policies announced by the government. Such a programme can be implemented only by effective decentralisation and a genuine democratisation of the Indian polity.

Also, we need to really improve our infrastructure, if even the liberal industrial licensing system has to spark off new industrial activity and employment. We need better roads, a more efficient railway transport system, better, cheaper and a more plentiful power supply, cheaper availability of basic intermediates, all of which may call for significant investments (mainly by the public sector) as well as greater efficiency of all PSEs. The budget can address itself to the first of these problems and therein it is found to be wanting.

It is only in such a framework and with a new thrust that the debureaucratisation of the Indian polity, of the industrial and foreign trade regimes, can succeed.

There arises the question as to how the immediate foreign exchange crisis can be averted. This concerns the budget only to the extent that it can reduce the revenue as well

as the overall budget deficit (as distinct from the fiscal deficit). As seen earlier, the budget could and should have addressed this question through a frontal attack on tax evasion, and by the collection of more direct taxes.

Incidentally, though this matter does not concern the budget, in his budget speech, the finance minister announced two parallel schemes: (a) people with tax evaded funds can pay 40 per cent tax on any amount held by them and convert the rest into white money, with no further questions asked; and (b) anybody getting foreign exchange remittances as 'gifts' would be exempt from the gift tax and the income tax, and again, there would be no questions asked as to the source of the remittance.

With the *hawala* rate for the dollar openly quoted at between Rs 31 and 33 per dollar, a holder of large amounts of black money can buy foreign exchange at this rate, and bring it back as a 'gift' from a non-existent friend/relative. Thereby, he discounts his black money at anything between 20 and 30 per cent, and converts it into white money without paying any kind of tax.

Apart from the highly objectionable ethics of this process, the policy is also bad economics, sets a bad example, and reveals a state of panic in the policy makers. Has the government lost all authority?

To conclude, there is no progress towards decentralisation in the budget for 1991-92. That is its greatest failing. Together with the danger that in the totality of the revenue and expenditure proposals, we may not succeed in achieving the macroeconomic balance that is urgently necessary, the budget—in association with other economic policies—may end up only imposing increased hardship to the common man, instead of restoring balance (and confidence) in the economy. What we need most urgently today is to make a serious effort to equate domestic saving with domestic investment, for which we need a two-pronged thrust: (a) a more purposive attack on the 'dissaving' by government administration by raising more taxes and by improving the functioning of government enterprises; and (b) an attempt to increase the savings of the community by stimulating 'local area planning' through devolution of both authority and finances.

Sustaining industrial growth through water management...

The inevitable spin off from industrial development is urban congestion. The steadily increasing demand for civic amenities puts great pressure on public utilities and calls for constant upgrading and innovations.

Hyderabad is no exception to this syndrome. The quality of life in this city of over 30 lakh people depends on a reliable system of water supply and sewerage. Hyderabad Metropolitan Water Supply & Sewerage Board gears up to meet this challenge.

Engineering cleaner environment

Cleaner environment

Making industrial plants healthier and pleasanter to work in. Mitigating the undesirable impact of industrialisation. Preserving the ecological balance. Dasturco is committed to these objectives and provides a wide range of environmental engineering (EE) services.

Impressive track record

For more than three decades, Dasturco has built extensive pollution abatement systems in various projects handled by it. In India and abroad. Complying with stringent national/international standards.

Global recognition

Dasturco's EE expertise is internationally acclaimed. Its services have been called in by UNIDO for a study on pollution control in Brazil's integrated steel plants. Also by UNEP to assist in preparing the guidelines for environmental pollution control in the iron and steel industry.

EXPERIENCED PROMOTERS. WORLD-CLASS TECHNOLOGY.

Mysore Petro Chemicals now promotes IG Petrochemicals. A 100% Export Oriented Unit with the equity participation, technology and Assured Export Arrangement from world-renowned, Lurgi, Germany.

It's a sound combination for you.

Highlights: • India's largest Phthalic Anhydride Plant with significant economies of scale • 100% EOU promoted by Mysore Petro Chemicals Limited, a profit making Company, with over a decade long experience in Phthalic Anhydride (PAN) Industry • Technical Collaboration and Equity participation by Lurgi, GmbH, Germany • Technology with in-built advantages like self sufficiency in power • 5-year assured Export Arrangement with Metallgesellschaft (Lurgi's associate Company), 100% during first year and 75% for subsequent four years • Effluent water to be supplied to MPCL for recovery of Maleic Anhydride and pure water to be reused • Duty free imports of capital goods, component and raw materials plus exemptions on central excise and

central sales tax • Total Income Tax Exemption to the Company under Section 10-B/80 HHC as applicable on Export Profits • Tax Benefits – 80L, 80M and Wealth tax benefits • Listing at Bombay, Calcutta and Delhi Stock Exchanges.

Risk Factors: • Orthoxylene is the main raw material for PAN and both orthoxylene and PAN are subject to international price and exchange rate fluctuations • The rupee component of project cost is expected to increase by Rs. 240 lacs. Cost overrun on foreign exchange component of project cost is not presently ascertained • The Company is likely to face competition in the international market from well established multinationals who may be more cost effective vis-a-vis the Company.

Issue of 1,06,10,000 equity shares of Rs. 10 each for cash at par.

August 31, 1991.

Women in Hindutva Movement

A sinister feature of the Hindutva movement has been the projection of the militantly communal Hindu woman in a variety of unprecedented ways. The Rashtrasevika Samiti, the women's wing of the RSS, and the Ram Janmabhoomi movement

2057

Budget and Economic Restructuring

The 1991-92 budget in the context of industrial liberalisation, freer trade regimes and an exchange rate policy aiming to establish current-account convertibility of the rupee in the near future
An evaluation

2053

Deregulation Perils

Deregulation of financial services now propounded in GATT by the US and others is fraught with dangerous consequences and not only for the third world. Warning signals from BCCI crash

2045

Technology and Liberalisation

The pattern of behaviour of Indian firms in regard to building up their technological capability during the economic liberalisation phase in the 1980s holds some important lessons for future industrial/technology policies

M-87

Other Way to Accountability

Public accountability can be strengthened by moving away from exclusive reliance on controls to a system that uses exit and 'voice' mechanisms in conjunction with control

M 78

Corporate Democracy!

The proxy collection drive launched by the Ambanis for the EGM of L&T would suggest that the cult of booth capturing is perhaps being extended to corporate disputes

2041

Industrial Relations

Relations of production must change with changes in production processes. However, in real life, while changes in production processes are harbingers of organisational change, production relations tend to reinforce the status quo. A case study in industrial relations

M-101

Eighth Plan Farce

With the shadow of the IMF-World Bank combine looming large over economic policy making, the Planning Commission's charade of drawing up the Eighth Plan as if nothing was the matter fails to carry conviction

2037

Development Sense

The late Sukhamoy Chakravarty as a development theorist. An assessment on his first death anniversary

2063

Tehri Debate

Power projects need to be appraised within the framework of economic benefit cost analysis as used for major irrigation projects. The case of the Tehri project

2047

Pests' Return

Increasing pesticide use does not boost foodgrain production over the long term, but has led instead to the resurgence of both target and secondary pests

2039

Banking on MOU

Does the Memorandum of Understanding (MOU), as a performance evaluation system, provide the answer to the problem of sub optimal working of state level public enterprises?

M-93

Shaky Success

Constraints on the growth of the leather industry in the context of measures taken in recent years to encourage leather exports

M-111

Much to Hide

The Indian attorney general's performance before the UN Human Rights Committee earlier this year was far from creditable

2035

Market Failure

Why are prices of edible oils at record levels in a year of record indigenous supply?

2030

Political Biryani

Chicken biryani, a sign of good times for ordinary Tamils, was invested with the responsibility of dismantling the anti-Brahminism of the Dravidian movement in the recent elections in Tamil Nadu

2043

Towards Consensual Politics

SOME of Ajit Roy's remarks (June 15) have proved to be prophetic. There is no one party or coalition with an absolute majority. The largest single party, Congress(I) has been invited by the president to form the government which of course is a minority one. A firm parliamentary majority is no more there. A basic shift in the existing correlation of forces is very much on the agenda. The idea of a socialist revolution, according to Roy, is far in the offing and for the present what we can think of is a neo-Nehruvian model. But he has not developed the idea any further even as he has sketched a strategic conception and then the tactical tasks. He has talked about a broad centre-left alliance which would address the neo-Nehruvian model of development. Further, he says, "the main tactical tasks should be to isolate the BJP and its sympathisers on the one hand and to mobilise the bourgeois democratic elements as far as possible on a wide platform ideationally motivated by the left, on the other". I strongly feel that if BJP is isolated by non-BJP opposition making an alliance with the Congress(I), the ruling party, the consequence would be that all the negative votes in the next election will be cast in favour of BJP, strengthening the BJP in the process. Another important point is the weakness of the analytical method by which one first identifies the main enemy, then becomes part of the mobilisation against it and then, stage by stage, deals with all the enemies. This 'stagist approach' does not really address the diverse world views and realities of the Indian context which demand the 'simultaneous operations and interactions of number of factors and processes'.

Both Congress(I) and BJP nurture the idea of a centralised rule with an absolute majority promising 'national integration' and 'stable administration'. It might be true had the NF-LF alliance been elected with an absolute majority it's rule also would have been a prototype of the centralised Congress(I) rule. But the logic and the dynamics of the very configuration of NF-LF alliance contradict a centralised rule and demand a consensual political process. Now that consensual politics has emerged in the political scene through a hung parliament. As a ruling party, Congress(I) cannot exercise its authority with all the 'luxuries' of a ruling party and the opposition no more enjoys the privileged position by which it can put the blame for

everything on the ruling party as it has to share the responsibility of at least the major consensus decisions. In one sense this is the strength of the NF-LF alliance despite its fewer seats in parliament—it could force the ruling party to a minority status and subject it to consensual politics. As a result of this the nature of both the ruling party and the opposition undergoes changes. Identities of both are expressed at the level of how one is addressing key issues affecting the nation or how one plays one's cards in the resolution of contradictions existing in the country.

While NF-LF alliance would be acting this role in the 'opposition' it should continue its search for a new political model of consensus-building among diverse and pluralist forces based on nationalities, ethnicities, caste/class identities and movements based on issues affecting the nation. Consensual politics is basically anti-authoritarian and it is precisely because of this characteristic that the NF-LF alliance is poised against both BJP and Congress(I). Values like democracy, secularism, etc, are translated afresh into concrete issues and slogans (Mandal, masjid, etc) and they remain reference points for consensus-building among partners of NF-LF alliance. As the consensus-building politics asserts itself the classical right-left analytical frame recedes to the background. The traditional left parties, although they are part of this political praxis, have failed in giving it a theoretical articulation. But then what is more important is practical politics to

which they make definite contributions.

A neo-Nehruvian model would perhaps envisage a controlled economic process and centralised planning. But the recent trend in the global economic process is to decontrol the national economies and to consider the whole world as a single economic unit. The US-EEC-Japan axis at the helm of global politico-economic affairs, despite their competition among themselves, will see that any resistance to their riding high will be either neutralised or suppressed thanks to the eclipse of the socialist camp and the impotency of the NAM. We have seen Iraq biting the dust and now Yugoslavia is getting Balkanised; so the chances of any single nation putting up a fight and coming out successfully seem to be quite bleak. National sovereignty has almost become a myth. Any new move on the basis of nationalities, ethnicities, marginalised communities are neutralised and co-opted. The main trap is the 'development' model pursued by the given leadership of the poor nations in the hands of the monopolies. They should be isolated. The poor nations and nationalities, ethnic and marginalised communities of the world, today must address the development question on a new basis with a concerted and a co-ordinated fight on a global plane, perhaps taking lessons from the eclipse of socialist camp/NAM models.

Waiting Game

FOLLOWING a private member's resolution moved by the CPI(M)'s Joyneil Abedin seeking restrictive legislation on religious places, the Places of Worship (Special Provisions) Bill has been introduced in parliament. The statement of objects and reasons of the bill pre-empted attempts at inciting controversy in respect of places of worship in existence on August 15, 1947 by proposing that their status remain the same as it was on that date. The disputed site at Ayodhya that is currently at the centre of protracted conflict and shrines in Jammu and Kashmir are exempted from the purview of the bill. To take retrospective effect from July 11, 1991 the bill stipulates imprisonment up to three years and a fine for contravention of its provisions.

A bill that should on the face of it have invited strident attacks from the BJP and kindred mass fronts has on the contrary attracted some nonchalant, almost disinterested protest. Certainly the party voiced its opposition to the bill in tonal variations that ranged from the more sophisticated technical criticisms of Jaswant Singh to some sectarian rabble-rousing by its more rudimentary members. But these protests have been confined within more or less parliamentary limits and the controversy is scarcely of the magnitude that was perhaps anticipated and possibly even desired by sections of the political establishment. The suspicion that these protests are entirely for the record and no more may not be altogether unfounded.

The political motivations behind the introduction of the bill and those behind the BJP's subdued reaction fit well into the pattern of politics that has evolved in the post-election phase. At one level both reflect a carefully nuanced process of vying for the Congress(I)'s attentions. The unwritten entente within parliament between the Congress and the BJP has shown little sign of wear and tear, much to the discomfort of the National Front and the left. Forcing the Congress to take an open stand to the detriment of 'Hindutva' apart from projecting the desired image to the minorities had also the potential of providing an edge of tension to the relations between the Congress and the BJP. Suggestions of an ongoing realignment involving the Congress and the Janata Dal, that were simultaneously in circulation, were too well timed to have been accidental. The intention may well have been to publicise a possibility and entice a realignment with the bill as a catalyst.

The bill's potential appears not to have been realised, at least for the present. The Congress, reluctant to foreclose any options regarding outside support, is content to be cool and accommodative. Under pressure from the National Front and the left, it conducted itself impeccably. For its part

the Congress has been discreet about an unavoidable commitment to see the bill through parliament, leaving the more vigorous defence of the bill to the opposition. An added if minor reprieve for the Congress is that support for the bill will silence, even if only momentarily, those within the party who are inclined to embarrass the leadership by publicly criticising any act of overt or covert co-operation with the BJP. As for the BJP the tepid response suggests that it sees little profit in an immediate confrontation. By merely displaying its indignation in parliament, voting against the bill and then allowing the whole issue to subside it may have far more to gain. A handful of perfunctory 'countrywide' agitations and some well modulated protests can take care of its Hindutva credentials while the bill, when eventually passed, will partly take care of the task of keeping the VHP in check.

The more immediate problem that the BJP faces *vis-a-vis* the VHP is the Ayodhya dispute. Though the VHP leadership is itself cautious about making things too difficult for the Kalyan Singh government in UP, compelled on account of restive cadres to be seen to be taking the initiative, it periodically issues ultimatums to the state government which being in no position to oblige has been proceeding with a degree of circumspection. Should the VHP, feeling the need to distance itself from this inactivity, lay claim to the other two sites—Krishnanjanmabhoomi and Kashi Vishwanath—as a diversionary move at a time when the BJP finds it inopportune, the latter can evade the dilemma of having to be the restraining influence. In such an instance the act can be allowed to regulate its relationship with the affiliated organisation.

The party may also see little reason to rupture the surreptitious goodwill that exists between it and the Congress. Between the fall of the National Front government and the general election the BJP made a virtue of its isolation. Following the elections, as the largest opposition in a hung parliament, the BJP has manoeuvred itself into a fairly profitable bargain. Forfeiting this over what is currently a non-issue for it is scarcely in keeping with the party's pragmatism. Most importantly, the BJP after its recent mass undertaking is fully alive to the limitations of mere legislation in the face of hysterical opposition. Should it see the need to deviate from its present line of moderation, a campaign can easily be mobilised against the 'black law' that deprives the devout of their fundamental right to worship. And as the 'rath yatra' to Ayodhya has amply demonstrated, a placid interregnum need not necessarily subtract from the pitch to which frenzy can be whipped up.

PUBLIC DISTRIBUTION SYSTEM Fact and Fancy

THE public distribution system for foodgrains and a few other essential consumption articles has figured prominently in the public pronouncements of the prime minister, no doubt in an attempt to foster the impression that in all the hard-headed pursuit of market-dictated economic efficiency under the supervision of the IMF social welfare concerns are not being jettisoned altogether. In his independence day address Narasimha Rao had announced that the PDS would be extended to 1,500 blocks in remote areas on a priority basis. And last week he inaugurated the meeting of the advisory council on the PDS with a rather lengthy address and told the assembled chief ministers—not too many were present though—and state food and civil supplies ministers that he would call another meeting after a month to work out details for making the PDS effective in the more remote and backward areas.

Certainly no one can say that the prime minister's focus on the PDS is unwarranted. With the rise in prices rapidly gathering momentum after the devaluation of the rupee and in the wake of the 1991-92 budget proposals, the PDS—even such as it is, confined, with the exception of one or two states, largely to the urban areas and not covering even these fully or adequately—will need to play a major role in protecting the essential consumption of the people within its reach. However, the available indications about what the government actually proposes to do in regard to the PDS do not quite match the prime minister's verbal concern.

Take the budget: the finance minister's decision to step up the provision for food subsidy to Rs 2,600 crore in 1991-92, compared with only Rs 1,800 crore provided in the Chandra Shekhar government's interim budget and Rs 2,450 crore allocated in the revised estimates for 1990-91, would seem a rather bold move in the face of the IMF's injunction to do away with all subsidies. But the convoluted arithmetic contained in the budget documents does not quite bear out this impression. A comparison with the 1990-91 budget shows that the Food Corporation of India's average sales realisation—which, it is to be presumed, would reflect the issue prices of the grain distributed through the PDS—would be higher by just over 15 per cent this year compared to last year in the case of wheat (Rs 229.42 per quintal against Rs 199.05 per quintal) and by nearly 29 per cent in the case of rice (Rs 375.22 per quintal against Rs 291.20 per quintal) and the subsidy per quintal

is to be reduced from Rs 116.22 to Rs 111.92 for wheat and very much more sharply from Rs 128.03 to Rs 80.50 for rice. Is this lowering of the subsidy per quintal to be squared with the larger amount of food subsidy provided in the 1991-92 budget in terms of larger quantities of foodgrains proposed to be distributed through the PDS this year? But no; the expected offtake of foodgrains from the FCI's stocks is kept exactly at last year's level—a neat 85 lakh tonnes each for rice and wheat. Thus the purported increase in food subsidy in the 1991-92 budget remains something of a puzzle.

In his address to the PDS advisory council the prime minister pointed out, quite correctly, that the government's employment generation programmes provide a very effective means of ensuring that the grain distributed through the PDS reaches the neediest sections of the people and suggested a target of supply of 20 lakh tonnes of grain to those who seek employment under these programmes through a part-cash-part-kind wage payment system. The suggestion is by no means novel, but both the centre and the states are evidently becoming progressively less willing to act upon it.

The annual report of the department of food for 1990-91 shows that the quantity of grain supplied under the employment generation programmes was 24 lakh tonnes in 1986-87, 10 lakh tonnes in 1987-88, 4 lakh tonnes in 1988-89, 2 lakh tonnes in 1989-90 and a grand 6,000 tonnes in 1991-92. The report does not, of course, attempt anything so indiscreet as to look for explanations for this steep and steady decline, but what is significant is that, apart from the prime minister, none of the others, including the state chief ministers and ministers of food and civil supplies, at the PDS advisory council meeting were at all concerned about it. This is undoubtedly an accurate measure of how much they really care about the PDS serving the needs of the poor and that being the case the follow-up meeting which the prime minister has called after

a month specifically to discuss ways of extending the PDS to remote and backward areas will be just so much waste of more public money.

PUNJAB Familiar Charade

MOVES are reportedly afoot for discussions between the Congress and the other main political parties on the holding of elections in Punjab. A plausible inference is that even on the Congress, or at least on a section of it, realisation has dawned that the mechanical pursuit of the methods dictated by the received wisdom on Punjab is no longer profitable. On the other hand, it is more than just probable that the prime minister's initiative is part of the now familiar charade enacted whenever constitutional obligations relating to Punjab have to be fulfilled. On the present occasion what is exercising the ruling party is not only the November 1991 deadline for the renewal of president's rule. There is the additional and more immediate inconvenience of having to deal with the existing notification for the elections that were originally scheduled to be held on June 22 but were postponed whimsically by the chief election commissioner to September 25 barely 30 hours before polling was due to commence.

As things stand, while the constitution provides for indefinite postponement of elections it does not permit denotification. This is particularly embarrassing to the Congress since the party has boycotted elections under the extant notification. The current exertions of the party seem to stem entirely from the need to circumvent this problem. In the past the haze of prevarication, engineered by the law and order and civil bureaucracies, which obscured the material facts about the situation in Punjab, facilitated unanimous all-party conspiracies to thwart the electoral process in the state by the periodic abuse of Article 356. The facts continue to be obscured but this time around the

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

by the BJP's intransigence ever since it discovered new possibilities for itself

The BJP's shifting stance on Punjab is finely tuned to the circumstances that the party finds itself in. In March this year when an amendment of the constitution was required in order to further extend president's rule the party was unwavering in its conviction that Punjab was not ready for elections and delivered patriotic sermons to those pleading for early elections. Immediately after came the civic polls in parts of the state with the party capturing the municipal corporations of the Amritsar and Ludhiana and narrowly losing to the Congress in Jalandhar. Consequently when the chief election commissioner peremptorily notified elections in Punjab, the BJP's protests were considerably diluted.

Now that the Congress has somehow to obstruct an election in which it is unable to participate the BJP's sanctimonious posturing has shifted from the patriotic to the democratic variety. Perhaps the BJP, with an eye on the 'non Sikh' votes would rather that if elections are to be held at all, they should be held under the existing notification. In order to profit from the absence of the Congress the BJP may well oppose the proposed amendment to enable denotification.

However the Congress, it would seem, has little cause to be overly alarmed. The left for either strategic or sentimental reasons it is still to be established which—has expressed its willingness to bail the Congress out of its difficulties. The CPI(M), concluding that an election is meaningful only if the participation of the Congress is ensured is all for amendment of the constitution. The CPI, which earlier in the year favoured elections in the state, began to backtrack under pressure from its Punjab unit. The party is willing to go along with the prime minister's suggestion that the election process be altered to bar avowed secessionists from contesting. Denotification will, of course be unavoidable in such an event.

If this kind of support does not suffice, other stratagems well suited to present requirements are available to the Congress. An escalation of violence in the state is calculated to ensure that elections are obstructed. In the past such coincidences have come to the aid of the government. This time too the security forces can, without too much effort, be persuaded to contrive an increase in the tally of killings. The law and order agency's efficiency in this regard is beyond question. And as if this is not enough, by another uncanny coincidence diverse Sikh groups, both moderate and militant, have been gathering repeatedly at Anandpur

and issuing precisely the kind of statements guaranteed to provoke the cancelling of elections. In the face of such smooth arrangements and all round co-operation even the BJP cannot perhaps do much.

WEST BENGAL

Self-Critical Exercises

A Correspondent writes

IT seems West Bengal chief minister Jyoti Basu has come into a sort of introspective mood in the wake of the recent elections. Immediately after his installation in the chief minister's chair for the fourth time, he started urging the party and the Left Front ranks to be modest and restrained in their dealings with the people. Then while addressing a meeting of artistes and intellectuals in Calcutta he made a critical analysis of the Left Front's campaign against the BJP's Hindu fundamentalist onslaughts and underlined their shortcomings. He emphasised the need for a deeper and more thoroughgoing counter offensive extending to broader ideological and cultural areas.

More recently, he has gone a step further in sharply coming out against the cult of violence and individual murders which seem to have become part of the prevailing political culture. He did not have only Punjab and Jammu and Kashmir in his mind. The provocation was a recent murder in Calcutta's south western suburb of Garden Reach resulting from feuds between two mafia gangs. A Congress councillor of the Calcutta Municipal Corporation was shot dead at his own doorstep. Subsequently another councillor was arrested by the police in connection with this crime. While the victim was elected on the Congress ticket his alleged assailant is identified with the CPI(M). The notoriety of these two characters and their associates is beyond question. This, however, has not deterred the Congress from making a hero of the victim and running a vigorous campaign calling for local bandhs, gheraos, and so on, totally ignoring the criminal connotation of the confrontation between the two mafia dons.

In this climate Jyoti Basu's admonitions have an extremely salutary relevance. It is, therefore, to be hoped that he will not only continue to make the self-critical exercises that he has recently initiated, but will also ensure effective follow up measures to translate the corrective guidelines into action. Otherwise, his critical observations would amount to only a stale repetition of Jawaharlal Nehru's similar exercises, in which Nehru often appeared in the role of his own loyal opposition.

TWENTY YEARS AGO

EPW, August 28, 1971

Isn't it time someone told the government how foolish it is beginning to look in its current exchanges with the three foreign oil companies? Speaking in Bombay last week, the union minister for petroleum and chemicals, P C Sethi, charged the companies with having refused to refine crude oil emanating from government sources. For good measure, he added the complaint that industrial relations in the oil companies were also 'none too happy'. Simultaneously there have appeared in the press reports of how, by way of preparing for the contingency of their being nationalised the oil companies have been dipping into their reserves to repatriate profits in excess of current earnings. As part of the same game, the companies had also stopped incurring new capital expenditure, cut operating inventories to the bare minimum and switched to borrowed funds for carrying on business. Other reports have charged the two American companies, Esso and Caltex, with deliberately keeping a part of their capacity idle, resulting in a shortage of petroleum products in the face of increased demand caused by "the Bangladesh situation". Surely, so awesome an inventory of misdemeanours calls for the most severe punitive measure. Nationalisation? Why not? After all, as P C Sethi told his Bombay audience in all seriousness, for a government which "could take powers for amending the Constitution, the issue of dealing with the oil companies was certainly not an intractable one". All this is, let us face it, so much nonsense. What the Government needs to do, instead of merely frothing at the mouth, is to get down to working towards a viable long term position in the oil industry. The first step in this direction would be the formulation of a realistic fuel policy based on recognition of the fact that in the foreseeable future we will continue to be dependent on imports of crude petroleum. The government has at the same time to give evidence of being able to establish independent sources of crude. Along with crude supplies the government has to make sure of the means of transport. These are the kind of problems that the government should be addressing itself to if it wants to get into a bargaining position which the oil companies can be made to respect. Instead the oil minister chooses to lose sleep over the state of industrial relations in the oil companies!

Record Crop Fails to Dampen Prices

D P Sharma

RECORD high prices in a year of record indigenous supply could well be described as the most outstanding aspect of the edible oils market scene during the current oil year (November-October) which has now two more months to go. Edible oil prices touched their all time highs in the first week of August. The quotation for groundnut oil in Bombay (wholesale market) was marked up to Rs 37,700 a tonne. The other quotations were kardi oil Rs 40,500, refined rapeseed oil Rs 33,700, refined cottonseed oil Rs 35,100, refined soybean oil Rs 35,500 and edible grade rice bran oil Rs 29,500. The rise in prices since the beginning of the season ranges from 16 per cent to 27 per cent.

The rise in prices has occurred despite increased availability, reduced imports notwithstanding. Going by government estimates, oilseeds production in 1990-91 is a record 192.3 lakh tonnes, showing an increase of 14.8 per cent over the previous season's figure of 167.49 lakh tonnes and an increase of 6.7 per cent over the previous record production of 180.33 lakh tonnes in 1988-89. Edible oil imports in the current year so far are placed at 90,000 tonnes against 6.07 lakh tonnes in 1989-90 and 3.73 lakh tonnes in 1988-89. Taking domestic production and imports, edible oil supply this season will be the highest ever. This does not necessarily imply a reduction in the demand supply gap as the increase in demand has been higher than that in supply.

Several factors have contributed in varying measure to the surge in prices. These include the all pervading influence of increasing inflationary pressures in the economy, continuing big gap between demand and supply (imports included), distortions in the national demand supply equation caused by certain actions of state governments—the imposition by the Gujarat government of levies on the oil produced by millers is a case in point—speculative holding and hoarding of stocks by the private trade mainly with black money and lack of any discipline on the co-operatives and NDDB which are exempted from the purview of stock and credit limits applicable to private trade and industry.

The current oil season has witnessed the complete collapse of the price band scheme conceived as the key element in the integrated policy for oilseeds/oil evolved by the technology mission on oilseeds. That NDDB should continue to talk glibly about its role as a market intervention agency has an ironic ring about it as edible

oil prices have kept surging ahead all the time. NDDB's purchases of oilseeds/oils as also its sales have been essentially in the nature of commercial operations based on market judgment. Despite NDDB's claims, its sales of 'Dhara' groundnut oil cannot be treated as market intervention operation aimed specifically at imparting price stability in the market.

If Dhara brand groundnut oil is being sold at a price lower than the ruling price of groundnut oil from other sources of supply it is not because of a policy decision by NDDB to protect the interests of consumers. Nor is it because NDDB enjoys certain cost advantages by way of exemption from the rigours of credit and stock limits prescribed for private trade. The real explanation for Dhara's apparently lower price lies in the brand quality preferences for groundnut oil from other sources of supply. This assessment is supported by the fact that NDDB's operations have not had any chastening effect on the edible oils market.

This is not to argue that NDDB's operations are of little relevance for the oilseeds market economy. While the relief consumers have derived from NDDB's operations is questionable, oilseeds growers have certainly benefited from NDDB's procurement operations during the harvesting period. The NDDB has claimed that ever since it was entrusted with the market intervention operation it had ensured that imports were not used against farmers. It is true that NDDB has been opposed to imports (except when it wanted to export milk powder and import edible oil). But it is also common knowledge that edible oil imports had to be restricted during the past few years not because farmers' interests needed to be

safeguarded but because the rapidly deteriorating foreign exchange position did not permit imports on a large scale.

Recently, all kinds of reports have been going round about the government considering import of edible oils if only it did not involve any foreign exchange outgo. According to reports from New Delhi, the centre has evolved a scheme to meet the states' edible oil requirements for the public distribution system. Under the scheme, the states will receive oil supply from the STC against the foreign exchange earned by them from exports of non-traditional items. The Gujarat government is said to be the first to take advantage of the scheme. It will export around 30,000 tonnes of soda ash and after realisation of the proceeds, edible oil of equivalent value will be supplied by the STC.

There have been reports that the department of economic affairs had concluded an agreement with the US authorities for supply of substantial quantities of edible oil (upwards of 6 lakh tonnes a year) under P1460 stage III programme. But these reports have been denied by a US embassy diplomat in New Delhi who stated the other day that 'we had no formal request from India for vegetable oil under P1460 and that we're not in a position to do anything about it anyway for the rest of this year'.

According to another source claiming to be keeping a close watch on the goings on in New Delhi, a foreign party has been having discussions with the Indian government for setting up an oilseeds crushing plant based entirely on imported seed which will not involve any foreign exchange expenditure. This will have the benefit of augmenting supply of edible oil for the PDS at a concessional price and earning foreign exchange through export of oilmeal. Yet another proposal relates to supply of palm oil by Malaysia on an

APPOINTMENTS

CENTRE FOR SOCIAL STUDIES

University Campus, Udhna Magdalla Road,

SURAT - 395 007

The Centre, a multi-disciplinary research institution provides a congenial environment for research in the social sciences. The Centre has a few openings at the level of Senior Fellows, Fellows and Associates which correspond to the position and scale of University Professors, Readers and Lecturers respectively. Correspondence is invited from scholars specialised in agriculture and industrial economics, sociology, political science, anthropology and law. Scholars interested in studying Western India and Gujarat in particular are preferred. SC/ST Backward Classes and women scholars will be given preference.

Those interested may correspond with the Director and send their detailed curriculum vitae on or before 5th October 1991.

TABLE : EDIBLE OIL PRICES IN BOMBAY MARKET (WHOLESALE)

(Rs per 10 kg)

| | 1.11.1990 | 6.8.1991 | 29.8.1991 | Year Ago 29.8.1990 | Percentage Rise since 1.11.1990 | Percentage Rise over 12-Month Period |
|------------------------|-----------|----------|-----------|-----------------------|---------------------------------------|---|
| Groundnut oil | 315 | 377 | 365 | 304 | 15.9 | 20 |
| Sesame oil | 260 | 320 | 330 | 250 | 26.9 | 32 |
| Kardi oil | 335 | 405 | 400 | 320 | 19.4 | 25 |
| Rice bran oil | 214 | 295 | 265 | 195 | 23.8 | 35.9 |
| Refined soya oil | 275 | 355 | 327 | 270 | 18.9 | 21.1 |
| Refined rapeseed oil | 268 | 337 | 325 | 258 | 21.3 | 25.9 |
| Refined cottonseed oil | 290 | 351 | 342 | 272 | 17.9 | 25.7 |

annual basis for the next few years on easy credit terms.

Edible oil prices have registered modest declines from their early August highs. This, however, has brought hardly any relief to consumers as there has been little change in prices at the retail level. That apart, the ruling prices are substantially higher than the prices which prevailed a year ago. The rise in prices ranges from 17 per cent to 36 per cent, depending on the oil (see accompanying table).

It is difficult to predict how edible oil prices will behave during the lean months of September and October when the market will have to reckon with reduced domestic supply and increased festival demand. Much will depend on the arrangement the government makes for the supply of imported oil and the trade's assessment of new crop prospects. Un-

certainty surrounding the quantum of imports will tend to have a bullish effect on prices and one need not be surprised if prices move beyond their early August highs. However, if weather conditions continue to be favourable and general expectations of record kharif crops—essentially groundnut and soybean—materialise, speculative elements in the trade are unlikely to put up an aggressive posture. The groundnut and soybean crops are expected to set new records if climatic conditions remain favourable during the crucial period ahead.

Inquiries with informed market sources indicate that several big houses are very keen on acquiring solvent extraction plants in order to avail of the liberal incentives and tax concessions which have now been allowed to manufacturer-exporters.

COMPANIES

Larger Market Share

TATA OIL MILLS COMPANY (TOMCO) recorded an increase of 13 per cent in net sales during 1990-91. According to the company, it was able to increase its market share in soaps, detergent cakes and powder despite severe competition. However, the company's exports suffered a set back due to the Gulf crisis which brought down export earnings to Rs 8.22 crore from Rs 28.72 crore in 1989-90. Exports to USSR also saw a decline.

Overall profits and profitability came under pressure in 1990-91. There was a sharp escalation in the prices of edible and non-edible oils, mostly as a result of the government's decision to reduce imports drastically. Besides, a large quantity of rice bran oil was diverted for use by the vanaspati industry and this affected the availability and prices of this commodity for the soap industry. Operating profits showed a rise of 5.2 per cent, while net profits were up by 5.4 per cent. The rate of dividend was maintained at 20 per cent.

Production of soaps recorded a slight decline of 0.9 per cent from 1,07,653 tonnes to 1,06,637 tonnes. Production of synthetic detergents fell sharply by 57 per cent

from 13,485 tonnes to 5,833 tonnes. Production of vegetable oils also saw a decline from 4,865 tonnes to 3,544 tonnes. However, production of cattle and poultry feed recorded a rise. Out of total sales of Rs 381 crore, soaps formed 62 per cent followed by synthetic detergents (17 per cent), cattle and poultry feed (7 per cent), vegetable oils (5 per cent), toilet preparations (3 per cent), glycerine (2 per cent) and others (4 per cent).

The company's Madras factory, which added toiletries and toilet soaps to its product mix, has been modernised to produce many other items in the course of next year. The new fatty acids plant commissioned at Aurangabad started supplying fatty acids to other factories. Industrial Perfumes, in which the company holds 33 per cent equity, witnessed an improvement in post-tax profits. Tata Vashisti Detergents, a joint venture project with Maharashtra Petrochemicals, is expected to start trial production during current year. Tata Aquatic Farms, Orissa, a 100 per cent EOU, a joint venture project with TISCO, for prawn culture is also making steady progress. Another joint

venture project with West Bengal Industrial Development Corporation is also being proposed.

The company intends to diversify into manufacture of bone-China mixed-table ware. For this purpose a joint venture, Tata Ceramics Kerala, has been formed in collaboration with a British firm as a 100 per cent EOU in the Cochin Free Trade Zone. There is also a proposal to diversify into pigment grade titanium dioxide. The company further entered into a memorandum of understanding with an American company to set up a joint venture project to manufacture public and institutional hygiene and other household cleaning products.

Fund flow during 1990-91 was estimated at Rs 59.28 crore. Borrowings and trade dues formed 89 per cent of the sources of finance. Funds were used mainly for financing inventory, investment and loans and advances.

NOCIL

Squeeze on Profits

NATIONAL ORGANIC CHEMICAL INDUSTRIES, (NOCIL), a leading manufacturer of petrochemicals belonging to the Mafatlal group, showed lower production in 1990-91. A major breakdown of the cracked gas compressor in August 1990 led to a shut down of all plants for four weeks. Production of petrochemicals at 2.90 lakh tonnes showed a decline of 4 per cent over the previous year. Capacity utilisation for petrochemicals which was at 98 per cent was lower than 101 per cent in the previous year. However, the company achieved an increase of 13 per cent in net sales from Rs 395 crore to Rs 446 crore. According to the company, this was due to better realisation from petrochemicals, higher volumes of agrochemicals in a very competitive market and increased exports. Out of the turnover, nearly 69 per cent was realised from petrochemicals, 16 per cent from agrochemicals, 7 per cent from marine products, 5 per cent from seeds and the remaining from trading in detergents, plastics and others. Though the quantum of sales of petrochemicals showed a decline, the value realised registered an increase of 6 per cent from Rs 325 crore to Rs 344 crore.

Export turnover registered a sharp increase from Rs 34.8 crore to Rs 61.9 crore. Supply of manufactured products to exporters under the deemed exports scheme amounted to Rs 3 crore against Rs 2.6 crore in the previous year. According to the company, chemical intermediates and polypropylene-woven sacks were the main value added products exported, with the latter showing good promise for the future. The company made a beginning in the export of soya meal and agro-

products.

The overall expenses-to-sales ratio works out higher at 0.92:1 in 1990-91 than 0.90:1 in the previous year. Consequent to the Gulf crisis, the price of naphtha, the basic feedstock, went up by 24 per cent. This led to an increase in prices of almost all the input materials. Raw materials consumed showed an increase of 18 per cent and power and fuel of 21 per cent. The operating profits of the company recorded a decline of 5 per cent over the previous year and net profits fell sharply by 15 per cent.

The company's programme of modernisation and expansion of its plants at Thane is currently under consideration of the government. The delay has caused considerable cost overrun. The expansion programme includes increasing the capacity for ethylene from 63,000 tonnes to three lakh tonnes and propylene from 37,000 tonnes to 1.4 lakh tonnes at cost of Rs 3,000 crore. Environmental clearance is the basic hitch.

Funds flow during 1990-91 is estimated at Rs 107.25 crore. External sources accounted for Rs 98.8 crore, with borrowings forming 73 per cent. As much as 26 per cent of the total was used for fixed

assets formation, 37 per cent for loans and advances and 19 per cent for investment.

BIRLA JUTE

Improved Profitability

BIRLA JUTE, a highly diversified company, achieved 15.9 per cent increase in net sales. According to the company, this was mainly due to better realisation on cement sales. The ratio of overall expenses to net sales stands reduced at 0.95:1 from 1.03:1. Reflecting this, operating profits and net profits showed sharp improvements.

Production of both cement and clinker were lower than the previous year—that of clinker by 3 per cent from 22.21 lakh tonnes to 21.50 lakh tonnes and that of cement by 5 per cent from 25.70 lakh tonnes to 24.38 lakh tonnes. The production of granulated slag cement fell by 17 per cent from 2.40 lakh tonnes to 1.99 lakh tonnes. The lower production was mainly due to the prolonged disruption in production at the Chittor cement works due to an industrial dispute. Production of jute goods improved from 66,975 tonnes to 7,21,715 tonnes, while that of synthetic, viscose and cotton yarn rose from 6,283

tonnes to 6,359 tonnes.

The new dry process plant at Satna achieved a capacity utilisation of 86.5 per cent for clinker and 84 per cent for cement. Birla Vikas also achieved a capacity utilisation of 44 per cent for cement and 95 per cent for clinker. At the Chittor cement works capacity utilisation dropped to 92 per cent for clinker and 58 per cent for cement. At Birla cement works capacity utilisation of 75 per cent was achieved for clinker and 101 per cent for cement, in spite of planned stoppage for modernisation from time to time. Production and despatches of cement at the Durgapur plant were lower due to frequent load-shedding.

The performance of Birla Synthetics was satisfactory. The plan of modernisation undertaken by the company is expected to be completed by 1992-93. The company exported blended yarns and cotton yarn worth Rs 1.74 crore against Rs 0.44 crore in the previous year. On the export front, Satna cement works and Durgapur cement works exported a total of 11,656 tonnes of cement valued at Rs 1.25 crore to Bangladesh. Besides the company exported a total of 70,730 tonnes of cement valued at Rs 7.81 crore to Nepal. However, the jute mill division witnessed a declining tonnage of exports mainly due to falling demand for carpet-backing cloth and reduction in Russian buying. However, local demand helped to maintain the price of finished goods generally in line with raw jute prices. Total export earning at Rs 32.49 crore formed 6.9 per cent of total net turnover. The devaluation is expected to help the company to increase export earnings in the current year.

The installation of high efficiency separators is in progress and is expected to be completed during the current year. The resultant energy saving and improvement in output of cement is anticipated to be reflected in the working results of the current year. The company has already received letter of intent for 5 lakh tonnes per annum covering the modernisation and expansion of Birla and Chittor cement works. Besides, the company has submitted an application for a letter of intent for a 12 lakh tonne substantial expansion at Satna, taking the capacity at Satna to 27.5 lakh tonnes per annum.

The company improved its profitability ratio substantially during the year. Gross return on net sales went up to 13.97 per cent from 6.57 per cent. The turnover ratio also rose from 0.94 to 1.03. Return on shareholders' capital went up from 2.58 per cent to 19.11 per cent. The dividend on equity was raised from 18 per cent to 30 per cent.

Funds flow in 1990-91 is estimated at Rs 62 crore. This was used mainly for fixed assets formation and tax saving investment.

Tata Timken

TATA TIMKEN, which plans to set up a plant at Bara, Jamshedpur, for the manufacture of 20 lakh tapered roller bearings and 40,000 sets of AP cartridge tapered roller bearings in technical and financial collaboration with Timken, USA, will enter the capital market on September 2 with a public issue of 2 lakh equity shares of Rs 10 each at par and 12.35 lakh (12.5 per cent) secured redeemable partly convertible debentures of Rs 50 each. The total issue consists of Rs 3,600 lakh in equity capital and Rs 1,950 lakh in partly convertible debentures. Shares worth Rs 1,700 lakh each will be subscribed by Timken and Tata Iron and Steel. Shares worth Rs 180 lakh and debentures worth Rs 97.50 lakh will be allotted to employees of the company on a preferential basis. Of the face value of the debentures of Rs 150 the convertible part will be Rs 50 which will be automatically converted on date of allotment into five equity shares of Rs 10 each at par. The cost of the project is estimated at Rs 8,376 lakh including Rs 2,598 lakh in foreign currency. This will be financed by equity capital of Rs 425 lakh, foreign currency loans from financial institutions of Rs 1,673 lakh, rupee loans from financial institutions of Rs 500 lakh from commercial banks of Rs 653 lakh and the non convertible portion of debentures amounting to Rs 1,300 lakh. The company proposes to implement the project in phases over three years and expects to commence commercial production in the first phase by early 1992 while the commencement of production for the fourth phase is expected by the first quarter of 1994. The automobile industry is a major consumer of tapered roller bearings with original equipment manufactures accounting for around 40 per cent of total production. According to a study by the Development Panel on roller bearings, the demand for tapered roller bearings is estimated at 16 million numbers per annum by 1994-95. Cartridge tapered roller bearings find application in railway wagons, coaches and locomotives. The estimated market for cartridge tapered roller bearings is around 1,35,000 per annum. The company does not anticipate any problems in marketing its output.

Radan Tapes and Tubes

RADAN TAPES AND TUBES, which intends to put up a computer tapes unit

and a video software unit, is entering the capital market on September 3 with a public issue of 22 lakh equity shares of Rs 10 each at par. The company's total issue is for Rs 400 lakh, of which shares of Rs 100 lakh are to be allotted to the promoters and their friends, etc, of Rs 60 lakh to NRIs and of Rs 20 lakh to employees. The balance is offered for public subscription. The computer tapes plant will be located at Kodivale in Raigad while the video software unit will be located at Bombay. The project will cost Rs 601 lakh and is expected to be financed by equity capital of Rs 400 lakh, term loans of Rs 198 lakh, and unsecured loans of Rs 3 lakh. Phase I of the project is expected to start commercial production from the second quarter of 1992 and phase II will be taken up from June 1992. The raw material required is magnetic tape and import of the same is allowed under OGL. The demand for computer tapes is estimated at 6,83,000 tapes of 2,400 ft each per year and, in the absence of any local producers, the company does not anticipate any difficulty in marketing its products. In phase II, the company is installing the most advanced Betacam SP editing facilities and computerised animation system.

Shreyans Paper Mills

SHREYANS PAPER MILLS, which has an impressive track record of growth in sales, profits and earning per share and dividend, is entering the capital market on September 3 with a public issue of 2,43,850 secured partly convertible debentures of Rs 300 each at par for Rs 732 lakh. The total issue is for Rs 2,100 lakh of which debentures of Rs 1,045.50 lakh is reserved for allotment to shareholders on rights basis, of Rs 105 lakh is reserved for employees, of Rs 112.50 lakh for non resident Indians and of Rs 105.45 lakh for shareholders of Adinath Textiles. The convertible portion of the debentures is Rs 200, which will be automatically converted into 5 equity shares of Rs 10 each at a premium of Rs 30 each on expiry of nine months from the date of allotment of the debentures. The company is implementing a project to set up a spinning unit with 24,960 spindles for the manufacture of carded/combed/industrial cotton yarn with advanced technological features including chute feed system of transfer from blow room to cards, auto doffing in cards for improved cleanliness, automatic dust collection system, auto cones, etc. The project is located at Machhiwara in Ludhiana and is estimated to cost Rs 3,700 lakh. This will be financed by the present issue of

Rs 2,100 lakh, term loans from financial institutions of Rs 1,500 lakh, cash accruals of Rs 70 lakh and state subsidy of Rs 30 lakh. The company is implementing the project in a phased manner and 6,000 spindles are already in operation. The company expects to put about 18,000 spindles in operation by October 1991 and complete complement of 24,960 spindles are expected to be fully operational by mid-1992. The company's project is located in the cotton producing belt. The hosiery counts will be marketed in the major centres close to Ludhiana, Saharanpur, Kanpur and Meerut. The industrial counts are proposed to be sold as tyre cord to cycle/rickshaw tyre manufacturers. The combed yarn is proposed to be exported as hosiery yarn to EEC countries, USA, Japan and Hong Kong. Cotton yarn is in great demand world wide. The company proposes to export 25 per cent of its cotton yarn. The profitability of the company's paper unit is also expected to improve with the completion of a modernisation and expansion programme.

Maral Overseas

MARAL OVERSEAS, which is setting up a 100 per cent export oriented spinning mill with an installed capacity of 20,160 spindles at Khalbujurg in MP, is entering the capital market on September 3 with a public issue of 37.87 lakh equity shares of Rs 10 each at par. The total issue is for 133.60 lakh shares, of which 84.10 lakh shares have been reserved for allotment to promoters, their friends, etc, 4.95 lakh shares to shareholders of Hindustan Electrographite and Rajasthan Spinning Mills and 6.68 lakh shares to employees of the company. The total cost of the project is estimated at Rs 34 crore to be financed by the present issue of Rs 13.36 crore, rupee loans from IFCI and IDBI of Rs 5.09 crore, foreign currency loans from Canara Bank, Bank of Baroda and ICICI of Rs 15.45 crore and state subsidy of Rs 0.10 crore. The plant is expected to be fully operational by January 1992. Raw material, namely, raw cotton varieties like F-414 and H-4 are available in the cotton growing belt of Madhya Pradesh. Export of cotton yarn from India has shown a steadily growing trend. The company has started seed marketing and exported yarn worth Rs 37 lakh to different European markets. It has also entered into a MOU with Ballward, UK and Currimee Jevanj, Mauritius, for supply of 400 tonnes per month of cotton yarn for a period of five years which will ensure offtake of the company's entire production.

Restoration Tragedy, Russian Style

GPD

It is a tragedy that Russia is going back to the age of the Tsars. Some people in our country see in all this increasing 'democratisation'. Well, if that is so, then Russia is 'democratically' going back to Tsarism. Yeltsin is the new Tsar.

RESTORATION tragedy is quite famous in English literature. It would seem that, beginning with August 19, the Russians are performing their own variation of the same. The coup led by Yanayev and its failure three days later have been much commented upon. The substance of the comments on the coup and its aftermath amounts generally to saying two things. One is the inept manner in which Yanayev and his colleagues went about their job. The other is the constant refrain, almost as gleeful as some people's response to Gorbachev's fall, that the days of Marxism-Leninism are over. We cannot claim any special knowledge in the matter of ideology. But it does seem as hasty and as unhistorical to pronounce the death of communism as was the earlier enthusiasm for possible return to the older order under the 'enlightened' leadership of the gentleman by the name of Yanayev.

But George Bush has done precisely that. Way back in 1974 Deng Xiaoping had pronounced the death of the socialist camp. Now George Bush has talked of the death knell of communism. It has obviously taken quite long for the patient to die. It seems clear that socialism is dead as far as Europe is concerned. The only world which matters is the European world anyway. Our commentators and experts, who think of themselves as Europeans, naturally think of the phenomenon as insiders. Having been colonised for over a century and a half, such identification is understandable, perhaps unavoidable. It gives them the satisfaction of being honorary whites for a while in much the same way as enthusiastic support for Yanayev gives some people the satisfaction of being honorary revolutionaries.

And yet these two things by no means exhaust what has been happening in Russia. A part of the credit for the initial 'coup' should go to the Americans and the G 7 in general. Had the west not given the impression that it was undecided about its support to Gorbachev, the foolish eightsome would not have indulged in their adventurism. If what they did had anything 'left' about it then it was a classic case of 'leftwing' adventurism—an infantile disorder. Anyway they made brave to do what they did because of, among other things, the humiliation heaped on Gorbachev in the summer meeting of the G 7. He went there with a begging bowl and returned empty handed. This created the impression that the west was

not interested in the Gorbachev experiment. Gorbachev, on the other hand, has been making one concession after another in the hope that he would persuade George Bush that Gorbachev was his best bet in Russia. The result has been the near certain disintegration of the Soviet Union. The economy has been in ruins and Russian nationalism has been on the rise. The so-called hardliners read the signals not entirely wrongly. The western indecision provided the right opportunity to attack. And they did. Whether they were 'hard' or 'left' is clearly beside the point. Because, apart from the 'integrity' of the Soviet Union, they had no other programme. Besides, as Yeltsin viciously but not entirely unjustifiably pointed out, all of them had been hand-picked by Gorbachev himself. To call them 'hardliners' as everyone seems to be doing, is not very different from calling them 'liberators'. But then we live in an age in which words are either losing their meaning or acquiring meanings which are the exact reverse of their original meanings. The ancient Indian belief is that the world began with the word. In Russia the tragedy has begun with the distortion of the word.

It is a tragedy that Russia is going back to the age of the Tsars. Some people in our country see in all this increasing 'democratisation'. Well, if it is so, then Russia is 'democratically' going back to Tsarism. Yeltsin is the new Tsar. For him Russia is *ueber alles* (over and above everything). Naturally, he himself is also *ueber allen* (over and above everyone). One suspects that he does not mind the other 14 republics going away. In a sense disintegration of the Tsarist empire is perhaps the only guarantee of the new Tsar's survival. There was nothing 'civilisational' about Tsar's and Stalin's expansion. So it was good as long as it lasted. If it breaks up now, Yeltsin has nothing to lose. The plain fact is that the break up of the Soviet Union does not hurt 'Russian' interests. The nationalities thesis which nobody has ever clearly understood anywhere anyway, seemed to give the impression that Russian interests would actually be hurt if the union were to break. All our Hindu nationalists talk of 'Akhand Bharat'. But they know that the partition of India has in fact strengthened them. If the Punjab and the Kashmir troubles were to get out of hand, they would be the next rulers of India. Something similar has been happening in the

Soviet Union. For the last two decades, Russian chauvinism has been on the rise. It must be understood that it will benefit from the break-up of the union, all chauvinisms do. For all one knows, there might be a strange unanimity in Yeltsin's and American perceptions. *Solzhenitsyn Talks to the West* is the title of a collection of three lectures that the exiled Russian author had delivered in the United States in the 70s. One underlying theme of these lectures was his moral indignation that the west in general and the Americans in particular do not understand how Bolsheviks had destroyed (rather attempted to destroy) Mother Russia. It would seem that the Americans have finally seen the light. Hence their enthusiasm for Yeltsin.

It cannot be ruled out that the armaments industry in the US needs an aggressive nationalism in Europe both as its own *raison d'être* and also as a counterpoint to the rising German power. One can almost see the Anglo-American delight that Boris the Bully has risen in Russia now that Bolshevism has finally been buried. The fact of the matter is that they cannot afford unqualified peace in Europe. They would want a bully around. Of course, Yeltsin is not going to launch a war. But then Brezhnev did not either. It is the general direction of Yeltsin's politics which is desirable. 'There is a bully in the Kremlin and all is well with the world'—this has been the fundamental principle of American foreign policy for the last few decades. Under Yeltsin it will get another lease of life.

This is the reason why the irrelevant issue of the rise or fall of socialism should no longer be discussed. On the contrary, the time has come to say that in our opinion what has happened (or did not happen) in Russia is of particular relevance to our plight. If anything, it has made our pathetic situation more than obvious. This amounts to taking an unpopular view. But that has to be done. In the 18th century there was a playwright critic by the name of Gottsched in Germany. He was hailed as someone who had given 'a new direction' to the German (dramatic) scene. Talking about him, G E Lessing, the founder of modern German, in fact European, drama, said:

No one we are told will deny that the German stage owes a great deal of its initial improvement to Professor Gottsched. I am this no one, I deny it outright. His desire was not so much to improve our former theatre as to create a completely new one. And of what kind? A Frenchified one (*eines franzoesevenden*), without inquiring whether or not this Frenchified theatre was appropriate [to Germany].

Just read Gorbachev and Yeltsin for Gottsched, economy for theatre and westernised for Frenchified. Lessing's defiant remarks have a validity of their own, particularly because the tragedy of Tsarist restoration has just begun in Moscow.

India's International Accountability on Human Rights

A G Noorani

The UN International Covenant on Civil and Political Rights requires India to report on its observance of the Covenant. This year India filed its report belatedly after at least five reminders. And when the report was examined by the Human Rights Committee set up by the covenant, India's attorney-general, who appeared before the committee, emerged from the examination badly battered.

IT remains unpublicised by the official and demi-official media, but India is liable to be asked to account regularly to a UN forum for its observance of human rights and its representative grilled to answer specific questions by a body of informed independent experts. This is because the Janata government had ratified the UN International Covenant on Civil and Political Rights in 1979. It requires India to report on its observance of the covenant. The report is examined by a Human Rights Committee set up by the covenant. It consists of experts who function in their individual capacity.

In 1984 attorney-general, K Parasaran, was grilled. This year the report was examined in March. It had been filed belatedly after several reminders—at least five. The attorney-general, G Ramaswamy, appeared before it and came out badly battered. The committee examined India's report on March 26 and 27, 1991 at New York. Its chairman was an Italian jurist Pocar, an extremely able person. Ramaswamy began by waxing eloquent on India's report. He cited "the free press, the All-India Radio and the independent judiciary" as "the most important vehicles for stimulating public opinion and creating an atmosphere in which human rights could be observed and protected". Is AIR flattered by such false praise?

The chairman thereupon brought our voluble Ramaswami down to earth by raising specific issues. The authoritative Summary Record of the proceedings are most instructive:

The Chairman read out section I of the list of issues concerning the second periodic report of India, namely: (a) the status of the covenant within the Indian legal system and the resolution of possible contradictions between domestic legislation and the covenant, (b) any cases during

the period under review where the provisions of the covenant had been directly invoked before the courts or referred to in court decisions or where a law had been disregarded by a court on the grounds that it was contrary to the covenant, (c) measures which had been taken since the consideration of India's initial report to disseminate information on the rights recognised in the covenant, particularly among the various minority communities in their own languages, and (d) factors and difficulties affecting the implementation of the covenant.

Mr Ramaswamy (India) said, with respect to section I(a) of the list of issues, that in his country the rules of international law were incorporated into national law and considered to be part of it unless they were in conflict with an Act of Parliament; national courts were under an obligation, within reasonable limits, to interpret national law so as to avoid confrontation with the community of nations or the well established principles of international law. In 1990 the Supreme Court of India had observed that in the event of doubt the national rule was to be interpreted in accordance with the international obligations of the state. The rights included in the covenant had already found their place in the Indian Constitution and other laws, and so the question of contradictions between Indian legislation and the covenant was purely hypothetical. No such contradictions had been encountered, and in the period under review Indian courts had not been required to adjudicate any case arising from such contradictions; had they been required to do so, they would have attempted to achieve an interpretation reconciling international law and national legislation.

He proceeded to answer queries in the same formal vein. The member's concern, as Nandita Haksar has pointed out so ably, centred on the Armed Forces (Special Powers) Act and the TADA.

Rosalyn Higgins is a noted authority on international law. She took up Ramaswamy on international law. He rejoined by saying international law conferred no rights on the individual who could rely only on domestic law. Rosalyn Higgins' observations deserve to be quoted:

Mrs Higgins said that while from a common law point of view she understood the theory behind the statement that the guarantees required by the covenant were all present in existing Indian law, she was somewhat puzzled as to practical application, given the reservations expressed, which suggested that the covenant was to be interpreted in line with Indian law, rather than the other way round. She would appreciate a comment on that point.

She agreed with Mr Lallah that the National Security (Amendment) Act and the Terrorist and Disruptive Activities (Prevention) Act entailed derogations from rights under the covenant. Although occasioned by an emergency, those acts had not been proclaimed as emergency legislation. She wished to know why that was so, and why they had not been notified as derogations from the covenant, as required by the covenant itself. She noted, moreover, that no time-limit had been specified for some of the provisions. As the covenant seemed to be subordinate to the Indian Constitution and there were derogations from it, some of them without time-limit, covering wide areas of Indian territory, she would appreciate a statement on how the covenant could be said to apply in India.

She raised another pertinent point:

Mrs Higgins said that it was clear that the Terrorist and Disruptive Activities (Prevention) Act and the National Security (Amendment) Act provided for limitations in respect of the right of assembly, the courts and detention. Since those acts appeared to constitute derogations from the provisions of the covenant, it would be interesting to know why India had submitted no notification of derogation to the committee, as it was bound to do under article 4(3).

Other issues raised by the chairman related to emergency powers, non-discrimination, the death penalty, use of firearms by the police and security forces, treatment of prisoners and other detainees. The chairman's list on the last topic is interesting:

The Chairman read out section V of the list of issues concerning the second periodic report of India, namely: (a) detailed information regarding pro-

cedures for receiving complaints under the Bonded Labour System (Abolition) Act, 1976; (b) consideration to updating the Prisons Act, 1899; (c) controls to ensure that persons arrested or detained are not subjected to torture or to cruel, inhuman or degrading treatment; (d) machinery for carrying out an independent and impartial investigation into allegations of torture and of summary, arbitrary and extrajudicial executions, and independent investigations, if any, and their results; (e) information on arrangements for the supervision of places of detention and on procedures for receiving and investigating complaints; (f) compliance with the United Nations Standard Minimum Rules for the Treatment of Prisoners and accessibility of relevant regulations and directives to prisoners; (g) information on the scientific classification of prisoners with a view to preventing exposure to criminals during custody (para 65 of the report); and (h) information on detention in institutions other than prisons and for reasons other than crimes (e.g., in psychiatric institutions).

All these do not exhaust the topics raised, legal delays and freedom of movement among them. So were freedom of association, freedom of religion and freedom of press. On Prasara Bharati, Ramaswamy gave this assurance:

In 1990, the parliament had passed the Prasara Bharati (Broadcasting Corporation of India) Act. That Act sought to place the mass media, such as television, in the corporate sector, taking it away from full government control. The Prasara Bharati Board would be responsible for the supervision, direction and management of the affairs of the Broadcasting Corporation of India.

These extracts from the proceedings speak for themselves:

The Chairman read out section XIII of the list of issues concerning the second periodic report of India, namely: (a) clarification of the statement in paragraph 134 of the report that the reference to 'ethnic' minority did not apply to Indian society; (b) special factors or difficulties in the effective enjoyment by minorities of their rights under the covenant; and (c) additional information on the work and functions of the Minorities Commission and its effectiveness.

Mr Ramaswamy (India) said that although there were religious and linguistic minorities in India, the Indian people formed a composite whole racially, and hence the concept of ethnic minorities and ethnic majority did not apply.

With regard to section XIII (b) of the list of issues, he said that all human and fundamental rights and mechanisms for

redress were equally available to minorities, which, further, enjoyed a specific Constitutional right to establish and administer educational institutions, so there were no special factors or difficulties in the effective enjoyment of human rights by minorities in India. . .

Mr Sadi noted that Amnesty International, a respected international organisation, had recently published a detailed account of alleged torture and extrajudicial executions in the state of Manipur. He felt that India should have an opportunity to respond to such serious allegations, perhaps in writing, to the committee.

Mr Ramaswamy (India) observed that Mr Sadi had raised a very sensitive issue, because the Indian government, convinced that Amnesty International reports were one-sided and not impartial, did not recognise it as an official body with authority to supervise its activities. It would be recalled, incidentally, that he himself had acknowledged earlier that

thousands had been killed by terrorists in the disturbed areas of the country and that the government was trying to prevent such violence. However, if Mr Sadi personally brought up any allegations, he would personally order a government investigation into the matter and would inform Mr Sadi of the outcome. In ratifying the covenant, India had committed itself to making all rights available to all its citizens; and it had taken action on individual violations without, of course, having achieved Utopian conditions. India's judiciary was one of the best in the world, and its outstanding public interest litigation had in general uncovered all human rights violations, no matter where in India they occurred. The country as a whole was very sensitive to human rights and none were better sentinels of human rights than the Indian people themselves.

The sheer pomposity of our attorney-general is amazing. No wonder he made a poor impression on the committee.

Cholera's Return to Central America

CHOLERA's sudden appearance in Latin America, after almost 100 years in abeyance, presents health authorities with an extremely volatile situation. Every week more Peruvians fall victim to the disease: so far over 1,000 have died with 52,000 hospitalised out of 1,42,500 cases. The sickness has been discovered in Colombia, Ecuador and just recently, in Brazil, according to *Central America Report*, Guatemala. With the exception of Costa Rica, which possesses an acceptable potable water system and sufficient preventive medicine, the other countries of the region could be hit even harder than Peru. It is estimated that in Honduras, more than 30,000 people would be infected in less than three months once the disease gained entrance, with more than 80 per cent of the population (4,00,000) in the capital of Tegucigalpa possibly exposed to the bacteria. In Guatemala, according to Public Health Ministry data, the one million Guatemalans (10 per cent of the total population) who live in poverty belts within the metropolitan area have no access to any type of public services. Only 68 per cent of all homes in Guatemala City have access to potable water, while the purity of what is available elsewhere in the country is questionable. In rural areas, less than 50 per cent of the population have water at their disposal. With the prevailing cholera scare, the fears of many Guatemalans that their supposedly clean water is seriously contaminated are substantiated by daily newspaper reports. According to conservative data, in Guatemala only 38 per cent of the population have access to water; in Nicaragua, 49 per cent; Honduras, 50 per cent; El Salvador, 52 per cent and Panama, 83 per cent. Given these figures, the advice of health officials to boil water before drinking it and assume good personal hygiene habits, pales before the reality facing much of the region.

The monumental scarcity of water produces a plethora of problems such as overall unsanitary drinking and bathing conditions, disastrous

human waste disposal systems and generally negative health prospects. The international health organisations point out that there is another important factor in the propagation of any epidemic: the high rate of illiteracy. From a medical viewpoint, although the introduction of the bacteria is not fatal, the disease assumes fatal proportions owing to rapid dehydration caused by violent diarrhoea and vomiting. For this reason, immediate treatment is absolutely essential. This is where not only ignorance but a deficient health system come into play. In Peru, health officials have been confronted with public hospitals filled beyond capacity. The threat of a widespread epidemic in this case is a medical nightmare. The University of San Carlos in Guatemala reports that because of the country's precarious hospital infrastructure, Guatemalans today face much the same situation of a century ago when 12,000 people died in a cholera epidemic. According to Argentine biology experts, the elimination of cholera in Latin America will not be a matter of months but will take five to 10 years. The more time that passes, the more victims will die, since every day the number of poor increases. The Latin American Economic Commission (CEPAL) affirms that in the last decade, poverty has increased between 10 per cent and 15 per cent in Central America. If one considers that in 1980, 60 per cent of the inhabitants of the region were already poor, the number of Central Americans living in poverty now is around 75 per cent. The fact that cholera or any other endemic disease is nourished primarily by poverty means that stopgap preventive measures are generally ineffective. The kinds of services and attention most needed at this point are exactly those that have been the first cut as economic structural adjustment has taken its toll throughout the region. The dollar savings from such cutbacks in vital public services will be difficult to justify if the threat of a cholera epidemic becomes a reality in Central America.

NEW DELHI

Charade of Plan Making

BM

With the shadow of the World Bank-IMF combine looming large over economic policy making, the Planning Commission's pretence of carrying on as if nothing was the matter fails to carry conviction

IS the era of planned economic development coming to an end in India? It is not the first time that this question has been raised after India embarked on the path of planned development after gaining political independence. But the persistence and stridency with which it is currently being raised is quite remarkable. The reconstitution of the Planning Commission by the prime minister P V Narasimha Rao, albeit with some delay and, some say also with hesitation and reservations, has not put an end to such questioning. Such questioning has actually become quite cynical. This is not fortuitous either. It is not the incompetence of the planners and their inability to produce a feasible plan or the inability and unwillingness of the administrative set up to implement one which is at the root of the questions being raised and misgivings that are being expressed. In fact the professional planners in Yojana Bhavan can very well claim, as they actually do, that their plan making exercises have become, over the years, more detailed and meticulous. If their labours have proved infructuous and have failed to bear fruit in recent years, the fault is not at their level. If they have been frustrated in the past by policy makers or the lack of appropriate policy decisions at the highest levels of the government and the political leadership they are now facing the position that the philosophy and rationality of development planning is being questioned in the name of so called market friendly approaches to tackling the problems of socio-economic development.

The process of economic development and planning has undoubtedly reached a difficult and complex stage. Uncertainties have grown and the need for radical and decisive action to overcome them has become imperative. The balance of payments crisis on which attention is sought to be focused at present is but part of a cumulative set of problems on a broad front. The fact indeed is that most trying for the politicians and administrators, as for the planners, is the sharpening conflict of interests in the economy,

society and polity which does not give much room for soft options to deal with these conflicts and so manage them in such a manner that orderly planned development becomes feasible and operational. An old hand in Yojana Bhavan wryly remarked that Pranab Mukherjee, the present deputy chairman of the Planning Commission, has become an ardent planner: if he had found some other berth in the Narasimha Rao government, which he would have very much preferred, he would have come down on planning and planners with gusto.

The Planning Commission which has been reconstituted with the appointment of seven full time members has a large complement of cabinet ministers as part time members. This is not a good augury for the professional planners to function well and effectively. Past experience shows that the influx of cabinet ministers as members, which is also accompanied by a large complement of bureaucrats at various levels in the commission set up, has been deleterious for the health of the Planning Commission and has adversely effected its functioning and the quality of its work. The commission, as it has been constituted, does not inspire much confidence as to its technical expertise and comprehension of the problems of building an integrated policy frame and formulating a development plan which would be well structured internally consistent and feasible given the political and social alignment of forces. Another noteworthy feature is that the prime minister chose to reject, by and large, the recommendations of the deputy chairman of the commission on the appointment of the members. The personal contacts and the whims and fancies of the prime minister seem to have played a large part in the appointment of the members. A lacuna can be immediately noticed in the composition of the commission. There is no development planner and model maker among the members, though C Rangarajan is a competent economist in the field of his specialisation. There is a doctor, an educationist, a scientist and one who is interested in

rural development but cannot claim to be an expert in agriculture. It is significant that under the allocation of work to the members of the commission, Rangarajan would look after international economics and trade but financing the development plan has been kept by the deputy chairman under his personal charge. What is sought to be indicated, it is claimed, is a shift of emphasis, so far as the role of the Planning Commission is concerned. Planning of investment with resources which the public authority can mobilise and deploy resources which have shrunk to dangerously low levels, for the growth of industry and agriculture, is not on the cards now. Reliance will have to be placed on private enterprise for the development of industry as well as agriculture. The attention of the planners will be focused on formulating schemes for what is called the social sectors. How exactly these schemes will be financed is not made clear. The agencies that will mobilise resources for deployment in these schemes, presumably under an order of planned priorities, are also not being identified. The relevance of development planning in the liberalisation policy frame which has been projected in the policy announcements immediately after the formation of the Narasimha Rao government is still very hazy. The Planning Commission was not even constituted when the policy announcements were made. The only comfort for the planners may be that even the finance ministry and the commerce ministry have been mere mouthpieces for announcing ready-made blueprints, evidently provided by institutions representing the country's foreign creditors.

The new Planning Commission has decided that it will not engage in another exercise to define afresh the approach to the Eighth Plan beginning 1992-93. While thus formally accepting a two year plan holiday on the conclusion of the Seventh Plan, this decision also casts doubts on the keenness of the official planners to engage in a meaningful exercise to frame a sound Eighth Plan for socio-economic development. It is airily suggested that planners have already with them the two approach documents for the Eighth Plan, one drawn up by the Planning Commission under the aegis of the Congress(I) government before the 1989 general elections and the second one presented by the Planning Commission constituted by the National Front government and approved by the National Development Council in 1990. It is ready to adopt both these documents and the totally divergent approaches they embody and pretend on

that has to be well-equipped to write the Eighth Plan. In addition, there is the hurriedly prepared draft of the Eighth Plan left behind by the Planning Commission set up by the Chandra Shekhar government which, it is smugly suggested, can be given final shape with some minor adjustments, delineation of thrust areas and of course, smart editing of the plan document. This is a fantastic position to take for the Planning Commission of a government which is claiming to make a sharp break with what is loudly denounced as the failed experiment in development planning in the past and proclaiming with gusto a new road to development based on private enterprise and play of market forces. A senior official with experience of old style planning has however been entrusted with the task of preparing a paper which will outline the so called thrust areas for planning and delineate the implications of the growth rate which the new government would like to project for the five year period of the Eighth Plan. The options here are said to be well settled. The thrust areas would be population control, development of infrastructure which will still have to be undertaken in the public sector to boost private enterprise. The definition of infrastructure of course, is still inconclusive and hazy. It includes, unquestionably power, irrigation, transport and communications. But it also includes human resources development which, in addition to technical training would also require primary education and health services to be promoted in a big way. Going on this basis, resources which the government and the public agencies in general will have to mobilise and deploy will still be enormous and pruning of investment in public sector industry is not likely to give much relief to the government in this respect. It is the ticklish question of the resources which has so far stood in the way of drawing up of the Eighth Plan. Also significantly the shrinking resources in the hands of public authorities for investment is also the driving force behind the so called market oriented liberalisation and privatisation policy. The deputy chairman keeping the finance portfolio to himself cannot tackle this problem. It can only be a cause for some embarrassment and friction between the finance ministry and the Planning Commission.

Pranab Mukherjee was denied by the wily prime minister his claim to the office of finance minister. Mukherjee has therefore to attempt to make his presence felt from his perch in Yojana Bhavan. He has, therefore, talked with much ebullience, contrived or sincere about the relevance of development planning and the need to "prioritise the development

process". Even when structural reforms to give market forces a dominant role in the determination of the content and direction of growth as well as growth agents in the economy and society are being pushed through. He was looking forward eagerly to the early constitution of the Planning Commission with members of his choice which would help give him an effective platform to operate in the present political-administrative set up. But he has again been let down with the prime minister ignoring his concerns and recommendations. Narasimha Rao took a long time to make up his mind since the reconstitution of the Planning Commission was evidently a matter very low in his priorities.

The chorus in support of privatisation and structural adjustment with a human face meanwhile is becoming strident as the populist ploy to cover up the true intentions of the vested interests in the economy and society and their political representatives. Mukherjee cannot stand aside and has to join it. He will be called upon to provide in the plan, without resources in sight, for 'safety nets' for the helpless and vulnerable segments of the population. Though 50 per cent of the population in India is still eking out an existence at or below the subsistence level and is outside the pale of what is called the market economy which provides effective demand for market oriented economic activity, the so called safety nets are being concerned partially to take care of only those who would be pushed out of gainful economic activity and made redundant by the so called efficient capital intensive modernisation of the production structure. What is in the offing is the further narrowing of the social base for the development process to make headway. The very idea that the Planning Commission, while it is made to shed its role as the prime agency for planning balanced and equitable socio-economic development, can be converted into an agency for formulating meaningful schemes for the social sector as an integral part of the design for development is, therefore, false, fanciful and deceptive.

While investment plans in the past created a dual society with the upper and middle classes consolidating their positions in the system inherited from the colonial era, any idea of development planning in which institutional reforms is given a role in investment planning now stands condemned by those who call the shots. The drift to a plan holiday has been the inevitable denouement. If the first three year plan holiday in the 1960s was an interruption in medium term development planning which could afterwards be resumed, albeit with significant policy

vacillations and equivocations, the five year holiday in development planning which is at present being observed cannot be easily terminated in order to return to meaningful development planning afresh.

It is necessary in this context to reckon with the dark shadow of foreign creditors and the World Bank/IMF combine over economic policy and planning exercises in India. The structural adjustment of the Indian economy is to be financed by the IMF and other foreign creditors, and involves acceptance, together with foreign credits, of onerous conditions, the primary condition being that development planning be aborted and the role of the Indian state in the development process significantly diluted. The fixing and prioritisation of the so called thrust areas of planning have become anachronistic propositions in the current economic situation.

The Planning Commission is being geared for preparing the draft, or at least a draft outline, of the Eighth Plan in the next couple of months to enable the holding of a session of the National Development Council. Another session of NDC is proposed to be held in February 1992, when the Eighth Plan in a finished form would presumably be presented to it for approval. Whether this time-table set for the planners by the deputy chairman of the Planning Commission will hold is, however, a moot point. The Planning Commission under the Chandra Shekhar government too had been persuaded to call a meeting of NDC in April this year to approve the Eighth Plan. The planners worked feverishly to prepare the chapters of the plan for this meeting. But by January, it had become clear that all this work was in vain and work on the plan had to be suspended when the so called high-powered committee of the prime minister, the finance minister and the deputy chairman of the Planning Commission failed even to meet to take a view on the resources position for the plan. When the presentation of even the budget was postponed, the work on making any kind of a development plan became infructuous and an exercise in futility. That the budget for 1991-92 was finally made and presented by the Narasimha Rao government does not mean that work on making the plan can now be resumed with any assurance or realism. The political uncertainties surrounding a minority government cannot be wished away. The resources position remains stretched. The competing demands on available resources for current consumption remain unchecked. The formulation of the Eighth Plan in these conditions will not carry conviction or credibility.

Pesticides: From Silent Spring to Indian Summer

Aparna Viswanathan

The debate over pesticide use in India has been framed in a false dichotomy: prevention of human and environmental pesticide poisoning versus increased foodgrain production and control of insect-borne diseases. However, analysis of the effects of pesticides reveals that increasing pesticide use does not boost foodgrain production over the long term but, instead, has led to a resurgence of both target and secondary pests

IN the name of science and control over nature, man's systematic pesticide poisoning of plants, animals, soil, water, and the entire ecosystem rages on unabated and unnoticed. In 1962, Rachel Carson published the classic *Silent Spring* which shocked the western world into consciousness and led to the banning of DDT as well as enactment of pesticide regulations in many countries. In 1977 *Rolling Stone* editor David Weir provoked another public outcry by disclosing that US and European corporations were selling drugs, pesticides and other chemicals which were banned in their home countries to the developing world. Other revelations followed in 1975. Ciba Geigy used Indians as human guinea pigs to test the effects of pesticides and sprayed 38 Indians aged 13 to 57 with the organophosphate, Nuvacron 40.

Nevertheless, while *Silent Spring* awakened the western world to the catastrophic implications of the systematic pesticide poisoning of the environment, India still slumbers in a Kumbhakarnic sleep—only one of the world's most hazardous pesticides, known as the 'dirty dozen', is banned in India. The 'dirty dozen' include DDT, BHC (benzene hexachloride), Aldrin, EDB (ethylene dibromide), chlordane/heptachlor, methyl parathion, paraquat, DBCP (dibromochloropropane), chlordimeform, 2, 4, 5-T, toxaphene and PCP (pentachlorophenol). These pesticides are deadly. Even one swallow of paraquat is a lethal dose for an adult. A spoonful of parathion, a nerve gas developed in the second world war, spilled on the skin is also lethal. Nevertheless, only 2, 4, 5-T has been disapproved for registration in India.¹ In sharp contrast, all of the 'dirty dozen' are banned or severely restricted in industrialised countries.

Measured by tonnage, at least 70 per cent of all pesticides used on Indian farms are banned or severely restricted in western countries and identified by the World Health Organisation (WHO) as extremely toxic or hazardous. An even greater percentage of pesticides banned in the west are

used in Indian public health programmes. For example, although DDT has been banned in 24 countries, India consumed 15 826 metric tons in public health programmes in 1984-85.² Similarly, although BHC—twice as toxic as DDT—has been banned in five countries and severely restricted in 15 countries including the US, 25 000 tons were used in India in 1986. And the list goes on—150 tons of heptachlor, three times as toxic as DDT and banned in 20 countries, are consumed annually in India. DBCP, banned in 18 countries including the US, is used on wheat and other crops in India.

India is the largest consumer and manufacturer of pesticides among south Asian and African countries and pesticide use in India has multiplied 20 times between 1960 and 1980. The introduction of high yielding variety seeds during the green revolution increased pesticide consumption as the new varieties are less resistant to pests than traditional seeds.

The risks of increased use of hazardous pesticides are magnified in India, in tropical conditions, it is very difficult to use protective clothing, face masks, gloves and boots while spraying. Furthermore, illiteracy and lack of information among farmers contribute to pesticide misuse. A recent survey of farm workers spraying pesticides in Gujarat revealed that the workers were not given any protective clothing, only 50 per cent covered their faces with a cloth and only 20 per cent washed their hands after spraying.

As a result of the widespread use and misuse of hazardous pesticides, India accounts for over one third of the 5,00,000 acute pesticide poisonings which the WHO estimates occur every year in the developing world. In addition to acute poisoning, exposure to the 'dirty dozen' pesticides produces latent diseases and disorders such as cancer, heart disease, brain, kidney and liver damage as well as sterility, spontaneous abortions and birth defects.

Indians face a much higher risk of death and disability caused by acute and cumulative exposure to pesticides as they

carry more pesticide residues in their bodies than people anywhere else in the world. Indians ingest 40 times as much DDT and BHC as their American and English counterparts.⁴

The level of DDT and BHC residues in food in India is among the highest in the world. According to a 1984 study by the UN Food and Agriculture Organisation (FAO), all of the 1,500 samples of cereals, pulses, milk, oil and meat sampled from all over India contained DDT and BHC, and the residues exceeded the WHO safety limit in 25 per cent of the samples. In contrast, only 12 per cent of the food samples had residues above tolerance levels in market basket surveys in developed countries. Furthermore, Indian babies imbibe eight times more DDT in their mothers' milk than American, Swedish and German babies.⁵

In addition to the catastrophic effects on human health, pesticides have also polluted water, soil and air as they do not degrade easily and can persist in the environment for as long as 20 years. Furthermore, as pesticides are not selective biotic killers, they also kill many non-target species as well as the targeted pest. For example, DDT is highly toxic to aquatic life and bird populations and, due to aerial drift, it is impossible to prevent DDT from spreading to areas even remote from the site of application.⁶

However, the debate over pesticide use in India has been framed in a false dichotomy: prevention of human and environmental pesticide poisoning versus increased foodgrain production and control of insect (vector) borne diseases. The systematic pesticide contamination of the ecosystem is defended as a necessary evil in order to increase agricultural yields and control malaria. However, analysis of the environmental and biological effects of pesticides reveals that increasing pesticide use does not boost foodgrain production over the long term but, instead, has led to a resurgence of both target and secondary pests. Similarly, although pesticides reduced the incidence of malaria following the second world war, a resurgence of malaria has occurred. Like all wonder drugs, pesticides promised miracles but only delivered addiction.

Pesticides have led to a resurgence of pests many times greater than the initial outbreak as, first, they are not selective killers. Pesticides poison many nontarget species including the natural predators and parasites position of the target pest. The few surviving natural enemies starve to death after spraying as the pest populations are temporarily too low to provide sufficient food. Subsequently, the surviving pests multiply without control as their natural enemies have been killed. For example, use of DDT to control the boll

weevil, a cotton pest, destroyed the fire ant, a natural predator of the boll weevil.

Pesticides also destroy the natural enemies of non-target pests thereby disrupting the population control mechanisms provided by nature and transforming insects which previously caused minor problems into serious pests. For example, use of DDT and methyl parathion to control the boll weevil destroyed the beneficial arthropod parasites and predators residing in cotton fields which resulted in an enormous outbreak of the bollworm and tobacco budworm known as the *Heliothis* complex. While the *Heliothis* complex had only caused minor and sporadic damage prior to the introduction of DDT, it replaced the boll weevil as the primary cotton pest by the early 1960s.

In addition to destroying natural enemies pesticides result in the emergence of resistant insect species. Resistance develops according to the Darwinian concept of natural selection. As only the tough insects survive the chemical spraying, they become the parents of the next generation passing down the genetic traits for chemical resistance.

According to a 1980 study by the IAO 432 species of arthropods are resistant to several insecticides. As a result, cotton farmers in Gujarat spray their fields 20 to 30 times more often than before with increasingly toxic and expensive pesticides which constitute over 50 per cent of cultivation costs. In Maharashtra, expenditures on pesticides have increased by 340 per cent without any increase in the average yield. In Andhra Pradesh, the state where the highest amount of pesticides, 15,000 tons a year, are consumed over 15 species of pests have become resistant to the commonly used agrochemicals.

Furthermore, malarial mosquitoes have also developed resistance to pesticides. In 1961, after 10 years of DDT use the number of malaria cases in India had fallen to 50,000. However, the *Anopheles* mosquito has become resistant to organochlorine pesticides such as DDT especially in areas which had adopted high yielding forms of agricultural production. Indian officials have also reported resistance to the more toxic organophosphate and carbamate pesticides. As a result, a resurgence has occurred in malaria cases which number over two million today.

Widespread pesticide use has both eliminated the natural predators and parasites of many pests and produced the emergence of resistant pest species. The consequent explosion of target and secondary pests has diminished crop yields and inflicted prohibitive pesticide costs on farmers. The ineffectiveness of chemical pest control is revealed by the fact that the 1,00,000 tons of pesticides consumed in 1984-85 in India helped save only 10 per cent of foodgrain production.⁹ Therefore,

pesticide poisoning of the ecosystem is not a necessary evil which must be borne in order to increase food grain production or control malaria. On the contrary, the reduction and elimination of pesticide use and the adoption of alternate means of pest control are the first steps toward increasing crop yields and eliminating disease over the long term.

Recognising the ineffectiveness and tremendous hazards created by pesticides, many western countries have shifted towards use of Integrated Pest Management (IPM). The fundamental difference between IPM and pesticide use is that while chemical control spreads an indiscriminate biotic killer in the environment without regard to the interaction of such chemicals with the processes of nature, IPM stresses enhancing pest control mechanisms which already exist in nature and disturbing these natural processes as little as possible.

IPM relies on a combination of techniques which include biological controls such as releasing natural enemies of the target pest in the area where the pest is located, developing host resistance by selective breeding of resistant crop varieties, autocidal controls, that is, tactics which cause the pest to contribute to the reduction of its own population such as release of laboratory propagated sterile males, and cultural controls—techniques which make the environment less favourable to pest reproduction and survival. Cultural controls include early planting to avoid peak pest periods or sanitation to remove food and breeding sites for pests. Crop rotation is also used against pests which cannot survive for long periods of time without crop contact and trap crops are used to attract pests to a small early crop which is then destroyed.¹

Experimental IPM programme in India have successfully reduced use of pesticides on cotton by one half and have increased yields. The IPM programmes emphasise choosing a seed variety which avoids maximum boll formation during the peak period of bollworm activity, sowing in May, use of parasites and sanitation measures such as uprooting crops at the end of the season.²

In Cuttack, Orissa, an IPM programme used early maturing, short duration varieties of rice resistant to gall midges and the stem borer and rice stubble was destroyed by ploughing after harvest to avoid pest carryover. As a result, the major rice pest the stem borer reached the economic injury level only in one of 11 villages and pesticides use was drastically reduced to one spraying in the field and the nursery.³

Biological controls have been proven successful in controlling vegetable crop pests in India. For example, larval parasites were used to control *Plutella*

xylostella, a cabbage pest, by 47 per cent; consequently, 100 per cent of the plants produced normal heads of cabbage with only the outer leaves damaged.¹³

Biological controls have also been successfully used instead of DDT to control malarial mosquitoes. A strain of the bacterium *Bt* var *israelensis* Serotype H-14 is a mosquito larvicidal agent which achieves 100 per cent mortality. Fish have also been used to reduce breeding of the *Anopheles* malarial mosquito from 32.8 per cent to 1 per cent in India one month after introduction into wells in Pondicherry. Another Indian field experiment used natural and synthetic garlic extracts as a mosquito larvicide against *Anopheles*.¹⁴

Instead of using BHC to control storage pests, jute bags treated with either 2 per cent ascorbic acid or 1 per cent acetic acid protected stored wheat grain for three months. Furthermore, the leaves and seeds of the 'neem' tree, indigenous to India, have been used to discourage pests when mixed with grains in storage.¹⁵

Experimental evidence reveals that Integrated Pest Management is a far more sustainable agricultural practice than pesticide spraying as it selectively controls pests without either creating an outbreak of newly resistant species or contaminating the entire ecosystem with toxic chemicals. In a country where over 22,000 deaths from pesticide poisonings occur each year, the manufacture and use of the dirty dozen must be banned and replaced with a more ecologically and economically sound form of agriculture as the silent spring has turned into an even more deadly Indian summer.

War by Proxy

Madan Gopal Jajoo

The number of proxies collected by the Ambanis for the L&T extraordinary general meeting has set a record. In view of the possibility of multiple proxies having been given without infringing in law, it is necessary to verify the proxies and weed out the multiple ones. This elementary precaution has assumed significance in this case because it does seem that the cult of booth-capturing is perhaps being extended to corporate disputes

THREE years have elapsed since the Ambanis made their overt moves to take over I & T. The first year, September 1988 to August 1989, was rather uneventful, but the groundwork for waging a war, if it became necessary, had been prepared. Four Ambani nominees had become directors of I & T, one of them, D H Ambani, had become the chairman, and a large amount of Rs 91 crore, had been raised by issue of convertible debentures. The second year, September 1989 to August 1990, saw powerful fireworks and ended with the Ambanis clearly emerging as winners. They had succeeded in making the mega issue of fully convertible debentures (FCDs) of Rs 820 crore and in calling up half the amount, despite a fierce legal battle for purposes which met the pressing financial needs of Reliance companies. This, however, was not disclosed to the shareholders of I & T because they might not have reacted favourably. In the turmoil that followed, the Ambanis were deprived of the suppliers' credit of Rs 635 crore from I & T. But they were assured of satisfactory alternative financing of both Reliance Industries and Reliance Petrochemicals projects. They also lost the chairmanship of I & T but all the professional managers continued to give them due deference. Just as the year was coming to a close, the political climate which had been unfriendly, if not inimical, to the Ambanis in the I & T matter, had started to change in a manner favourable to the Ambanis. A less ambitious person would have been content with these substantial achievements. At this stage the Ambanis' holding in L&T was said to be less than 25 per cent as against the public financial institutions' 37 per cent.

Dhirubhai Ambani is evidently made of sterner stuff. When he sensed the change in the political situation at the start of the third year in September 1990, he decided to press further. Since November 1989 the litigation in the Supreme Court regarding the mega-issue of FCDs of Rs 820 crore had remained dormant. Earlier the court had approved provisional allotment in a manner which suited the Ambanis to the dot. Ambanis revived the litigation, ostensibly

because I & T's Board had decided to prune the size of the mega issue from Rs 820 crore to Rs 640 crore and make the issue partly instead of fully convertible. These changes required the court's approval. A few subscribers to the debentures felt aggrieved and took the matter to the Madras and Gujarat high courts, these came to be transferred to the Supreme Court to be tagged on to the pending litigation. In fact the debenture holders' grievance which was in reality instigated by the Ambanis, became the dominant issue in the Supreme Court proceedings.

During the course of the Supreme Court hearings, I & T's board made another somersault: they did not mind keeping the issue at the original amount of Rs 820 crore instead of pruning it to Rs 640 crore if the court was so inclined. At one stage the judges made a query as to why the company required Rs 820 crore now that they had decided to cancel the suppliers' credit of Rs 635 crore to Reliance companies included in the original estimate of outlay conveyed to CCI (though not to the shareholders). No one, I & T, the financial institutions, the government or the public interest litigants, all together represented by a dozen distinguished counsels, made any effort to inhibit the judges on this score. Ultimately the court gave its approval to the original amount of Rs 820 crore. One regrets to say that the whole legal wrangle fails to inspire respect for the judicial processes in the country.

The Ambanis had another stroke of good luck—a more pliable government had been installed in Delhi. They sought the removal of D N Ghosh from the chairmanship of I & T and the Chandra Shekhar government duly obliged. This, however, proved to be the proverbial half loaf, the Ambanis could not be expected to be reconciled to this. They wanted the company to be wholly under their control but could not even get back into the chairman's seat. The political situation in the country was such that even a pro-Ambani government thought discretion the better part of valour, notwithstanding the fact

that a general election, in which the Ambanis' patronage was a significant factor, loomed large.

There followed a lull of three months: the tragic death of Rajiv Gandhi prolonged the election process and finally a minority government took over the reins. This government swears by the legacy of Rajiv Gandhi, but is evidently not committed to accepting all the suggestions, requests or commands emanating from the Ambanis. In the last week of July the Ambanis made their move to force the hands of the new prime minister and finance minister. They were going to test their strength against the government in open combat.

A wholly owned subsidiary of Reliance Industries, Trishna Investments and Leasings had been the main vehicle for the Ambanis acquiring shares of L&T. Trishna sent a requisition for an extraordinary general meeting (EGM) of I & T, pursuant to its statutory right as holder of more than 10 per cent shareholding, to pass resolutions for (a) appointment of D H Ambani as director and chairman of the board and (b) appointment of Mukesh Ambani as managing director. The requisition stated that Trishna had more than 10 per cent shareholding in I & T; subsequent newspaper reports gave the precise figure 16.02 per cent. The Ambanis have been giving the impression that their total holding in I & T was very substantial—22 per cent, 27 per cent, even 35 per cent have been the figures bandied about.

But there is no possibility of verifying the details of shareholdings, not only of I & T but of any of the Reliance companies. One of the first moves made by the Ambanis after their four nominees joined the board of I & T was to transfer the share registry from Tata Consultancy Services to an in-house company of the Reliance group, Reliance Consultancy Services, located at Chembur, a distant suburb of Bombay. This insures total secrecy, even the largest shareholder, Life Insurance Corporation of India, was, in April 1990, unable to obtain details of I & T shareholdings after it had served a requisition for a meeting. The LIC had to knock at the doors of the high court for directions to the company to make available these details. Another source of verification of shareholdings is the Registrar of Companies. The RoC's office space is quite insufficient and inspection of shareholdings of large companies is practically ruled out. In any event, the RoC's office is equally subservient to the Ambanis. In 1989, this writer was unable to obtain inspection of the prospectus lodged in respect of the mega-issue even though the prescribed fee was collected.

from him.

Requisitioning of the meeting was meant as a warning shot, or, if one may use a different metaphor, beginning of the match between the Ambanis and the government. With a difference. The players on the government side were known—executives of public financial institutions with their benign interest in the outcome—whereas the Ambanis marshalled a team of unlimited numbers. The Ambanis own L&T shareholding, whichever figure was true, would not ensure their winning the match in opposition to the public financial institutions holding. About 1,78,000 persons held the remaining—30 per cent or 38 per cent—shareholding. The Ambanis organised a massive proxy campaign: a very large number of emissaries went round collecting proxies, on piece rate basis, culminating in a claimed 82,964 proxies representing 48.1 per cent of the equity shareholding. These were already lodged with the company by August 23. This was something of an incredible feat: if true, the match is over, the Ambanis having won a resounding victory. But this will be taking a simplistic view.

Proxy is an instrument which enables a shareholder who does not intend to attend a meeting to appoint another person to attend and vote for him. Companies usually supply blank proxy forms which the shareholder signs and, after affixing to each a 30p revenue stamp, these are to be lodged with the company 48 hours before the time of the meeting. Those soliciting proxies may also supply proxy forms. In the case of L&T's EGM, proxy forms were sent out to all shareholders by the company, by Irishi (which had requisitioned the meeting) and some Ambani associates. It is not improper for a shareholder to give more than one proxy, even after having given a proxy; he may attend in person, and if more than one proxy is given, all of them may attend. A proxy can vote only if poll is demanded, and in this eventuality, which proxy is valid is important. The large number of proxies collected by the Ambanis for the L&T EGM has set a record, and in view of the possibility of multiple proxies having been given without infringement of the law, it is necessary to verify these and weed out the duplicate, triplicate and quadruplicate ones. This elementary precaution has become very significant in this instance because a very large number of persons were deployed and allegations are freely aired of a substantial amount expended on the proxy campaign. Perhaps the cult of booth capturing has been extended to corporate disputes.

The ghost of the Ambani type of proxy war must be exorcised at the incipient

stage if the country is to retain a modicum of sanity in its corporate affairs. The Ambanis claim to have lodged with the company, prior to the meeting, 82,964 proxies, an average of about 12,500 proxies per day in 6½ working days between August 14 and 26. This sounds improbable, particularly in the context of the company secretary's quibbling about constraints of space and staff when this writer, as a shareholder, sought inspection of the proxies. These proxies were not just received; the necessary entries were presumably made in proxy register after due verification. And all the while the register of members and other records were tucked away in the Chembur premises of Reliance Consultancy Services.

After a token resistance by the Ambanis, the EGM convened on August 26 was adjourned to September 16, pursuant to the LIC's initiative. It is said that this adjournment was a ploy to avoid taking a decision while parliament remained in

session. Or, as *The Economic Times* said in a leader, the government wished to avoid a showdown until the Finance Bill was safely out of the way. The Ambanis, of course, are aware of this government's predicament and hence the massive proxy vote to force the issue. Since 1980 the Ambanis have moulded major government policies to suit their purposes. Since 1989 they have played a major role in the choosing of prime ministers. The next stage will be their exploiting the factionalism in the Congress(I) and dictating the choice of party's leader.

Since 1990, the Ambanis' aggressive postures have been met by successive governments by seeking soft options. The damage it has caused to the norms relating to corporate finances is all too obvious. The economic policy-makers in New Delhi have not been renowned for their vision in the past. Is the finance minister willing to make a new beginning and stand up to the Ambanis' onslaught?

World Trade in 1990

THE value of world trade rose by about 14.6 per cent in US dollar terms in 1990 compared with about 8.1 per cent in 1989 and 14.5 per cent in 1988, according to data in the 1991 edition of the IMF's *Direction of Trade Statistics Yearbook*. Trade volume growth slowed, however, to about 3.9 per cent in 1990 from 7.1 per cent the previous year, because of a slowdown in world economic activity, the disruption in trade among Central and Eastern European countries, and the rise in oil prices.

In 1990, industrial country trade grew at about the same pace as world trade. Industrial countries' exports rose by 15.3 per cent (or \$ 124.9 billion) and their imports by 14.8 per cent (or \$ 331.8 billion). Boosted by a lower dollar and strong demand from reunited Germany, the value of western European countries' trade rose by more than 20 per cent. In 1990, Germany overtook the United States as the world's leading exporter. The trade imbalances among Japan, Germany and the United States narrowed further in 1990. The US trade deficit declined by \$ 5.6 billion to \$ 123.9 billion. Germany's trade surplus was down by \$ 9 billion to \$ 62.8 billion, and that of Japan narrowed by \$ 12.6 billion to \$ 52.4 billion.

Developing countries' exports increased by 13 per cent or \$ 102 billion in 1990, while their imports rose by 15.3 per cent or \$ 116.7 billion. As a result, their aggregate trade surplus declined last year to \$ 7.3 billion from \$ 22 billion in 1989.

This reflected the mixed effects of the rise in oil prices, continued declines in non-fuel commodity prices, and slower demand from industrial countries. Among regions of the developing world, the west Asia recorded the fastest export growth in 1990 (23.9 per cent), mainly because of higher oil prices. West Asian countries' imports increased by 16.9 per cent. Their aggregate trade surplus increased by \$ 10.5 billion to \$ 30.5 billion in 1990, the highest level since 1981. The aggregate trade deficit of European developing countries widened by \$ 15.2 billion in 1990 to \$ 18.8 billion. These countries' exports declined by 5.8 per cent last year (following a 1.9 per cent decline in 1989), while their imports rose by 13.4 per cent. African countries' exports increased by 16.3 per cent in 1990—mainly driven by the oil exporting countries—while their imports were up 12.9 per cent. As a result, Africa recorded a trade surplus of \$ 3.5 billion in 1990, compared with balanced trade in 1989. The 14.5 per cent increase in the exports of Western Hemisphere countries was also mainly driven by higher oil exports. The region's imports rose by 20.3 per cent in 1990, and its trade surplus contracted by \$ 3.7 billion, to \$ 11.2 billion. In the Asian developing countries, the growth of exports in 1990 (12.3 per cent) was outpaced by that of imports (14.3 per cent)—a trend that held true for the region's leading trading nations. Asia's aggregate trade deficit continued to deteriorate, reaching \$ 19.2 billion at the end of 1990.

Chicken Biryani and the Inconsequential Brahmin

M S S Pandian

The Brahmin community constituting 'barely three per cent' of the population in Tamil Nadu but wielding as it does a near monopolistic control over the press, played a major role during the Lok Sabha elections in dismantling the anti-Brahminism of the Dravidian movement.

OCCASIONALLY greasy and always spicy, chicken 'biryani' has been a sign of good times for the ordinary Tamils—to be precise, for those ordinary Tamils who are chicken eaters. It is the Friday night special in niggardly students' hostels; small-time Chettinad hotels sell a large share of it during that elusive first week of the month when the salaried lower middle classes indulgently think, they have some extra money; the subalterns of urban slums bet in terms of half a plate of chicken biryani. Interestingly, during the recent election in Tamil Nadu, this harmless item in the gastronomical universe of the ordinary was launched on a major political career. It was invested with the supreme task of dismantling the anti-Brahminism of the Dravidian movement.

The new career of chicken biryani began in the Mayiladuthurai constituency in Thanjavur district and the person responsible for this was none less than the Doon School-educated Mani Shankar Aiyar. Aiyar won on a Congress(I) ticket over his DMK rival K P Kaliyanam in Mayiladuthurai constituency, and it was indeed a credible victory. As Aiyar records in a recent article in the *Sunday Observer* (July 7, 1991), "Most Significant of all, I, a Brahmin by birth (if not by conviction) with 'Aiyar' emblazoned (for reasons of regional identity) on my name and on the ballot paper, contested from a constituency of Thanjavur district, the very citadel of the Dravida movement. And became the first Brahmin in a generation to be elected from Tamil Nadu constituency other than Madras South." Epoch-making victories are often not easy victories and Aiyar's was not either. During the election campaign, the rabble-rousers of the DMK got as noisy as they could and accused this "first Brahmin in a generation to be elected to the Lok Sabha" of being just that—a Brahmin. An offended Aiyar writes, "...Kaliyanam (moderately and his DMK cohorts (viciously) went around talking neither of development nor of justice nor of national honour but

how I was - dare they say it?—a Brahmin, no less..." This was the moment of arrival for chicken biryani, a silent spectator so far; it shed its political innocence and came to the rescue of Aiyar. In Aiyar's words, "I went for the DMK arguments with a string of Kaliyanam jokes—challenging him to find the sacred thread on my body; challenging him to an open competition in the village square to see who could eat more chicken biryani—he or Brahmin me..." People of Mayiladuthurai knew, in 'open competition' without reservations, Aiyar was bound to win and he would eat more chicken biryani than the Brahmin-baiter K P Kaliyanam. As if to uphold efficiency in public life, they elected Aiyar.

While Mani Shankar Aiyar was educating the people of Mayiladuthurai that Aiyars are not Brahmins and they eat chicken biryani in village squares, there were other Brahmins who were, with exemplary modesty, claiming that Brahmins of Tamil Nadu are of no consequence anymore and their existence is a mere sociological relic. The campaign of the DMK chief M Karunanidhi, a self-proclaimed Shudra, against the Brahmins understandably provoked V P Raman of Madras. Peace-loving as he was, the only thing he could do was to write a letter to the editor of the *Sunday Observer*. The letter read as follows:

As a shrewd strategist perceiving the wave building up against him, Karunanidhi has chosen to spite and antagonise a community that accounts for a fraction of the state's population.

Karunanidhi squeals and shrieks much too often that he is the sole arbiter of communalism in politics and yet mounts an affront on an innocent and peace-loving community. All this makes me wonder if it is not eminently true that those whom the gods want to destroy they first make mad! (*Sunday Observer*, June 16, 1991).

The community which V P Raman is lamenting about is the Tamil Brahmin. 'Innocent', 'peace-loving' and numerically a fraction—in other words, they are

politically inconsequential. And the gods of V P Raman have always protected the innocent and peace-loving—at least from the days of Manu.

The argument about the inconsequential Brahmin repeats endlessly and V P Raman's letter is only an instance. Reporting the election campaign in the state, P K Balachandran, the Madras correspondent of the *Sunday Observer*, noted, "Karunanidhi's ire against the miniscule Brahmin community, which constitutes barely three per cent, is due to the fact that his tormentor and *bete noire*, Jayalalitha Jayaram, happens to be an Iyengar Brahmin" (emphasis mine; incidentally, it is not only Jayalalitha who 'happens to be' a Brahmin, but P K Balachandran also happens to be one). For P K Balachandran, it was unfortunate that the 'miniscule' and the 'barely three per cent' had to be the target of this heartless attack: "Unfortunately for the Brahmins of Tamil Nadu, all those involved in the ouster of the DMK government were Brahmins. Apart from Jayalalitha who had taken it up as a mission, there was Dr Subramaniya Swamy (a Madurai Iyer), Rajiv Gandhi (seen in Tamil Nadu as a Kashmiri Brahmin) and of course president R Venkataraman, who signed the sack order, is a Puttukkottai Iyer" (emphasis mine). What Balachandran did not mention in his report is that within hours of the dismissal of the DMK government the Brahmins' Association of Pallavaram brought out handbills describing the dismissal as the decimation of the Shudra rule in Tamil Nadu and claiming that Kanchi Mutt would now be the headquarters of the state. The poor, unfortunate Brahmins indeed.

While the Tamil Brahmins were offering to eat chicken biryani in village squares and celebrating their self-proclaimed insignificance, it was in fact a section of the non-Brahmins—the non-Brahmins belonging to the AIADMK—who took up the project of aggressively defending the Brahmins. K A Krishnaswamy, a veteran of the early DMK who willingly accepted endless humiliation from late M G Ramachandran and Jayalalitha to survive the vicissitudes of Tamil politics, was vocal: "Fifty years ago, when Periyar and Anna were leaders, Brahmin domination was conspicuous. Now they are into the modern technological caste free world. They are computer Brahmins, not orthodox ones." (Perhaps K A Krishnaswamy may concede that there are at least a few exceptions to these computer Brahmins such as Era Ramanathan, the AIADMK candidate of Kumbakonam(!) constituency, who sports nonchalantly a fine

Brahminical tuft, and Jayalalitha who, even before the election campaign took off, undertook a 'pilgrimage' to Kancheepuram, ironically the birthplace of C N Annadurai, and got the blessings of the 'acharyas') On a different occasion, he uncharacteristically thundered, "It was past when the Brahmins took all kinds of abuses. Once Brahmins were carrying 'tharuppal pull' [a grass used in rituals], but now they are carrying AK 47s." Though the peace-loving V P Ramaswamy would not have liked K A Krishnaswamy arming the Tamil Brahmins with AK 47s, he in any case would. R M Veerappan, once a book keeper of M G Ramachandran and now a prominent leader of the AIADMK, was equally, if not more, strident. Addressing a public meeting in Alanthur, he said, "During MGR's rule, the Brahmins came to us and complained that they were being frequently harassed by the DMK. We told them, 'All castes have their own associations and why don't you form one to protect yourselves.' Thus we are responsible for the founding and growth of the Brahmins' Association." He continued, "I know Karunanidhi very well. Karunanidhi is only a Shudra, born in a Sudhra family in a Tiruvarur family." Can there be anything without its other, the Brahmin without the Shudra? While K A Krishnaswamy and R M Veerappan were lending their well-trained voices for the cause of the Brahmins, Durai Thirugnanam, the AIADMK secretary of Thanjavur west, went a step ahead. He inaugurated a religious procession of 500 Brahmins in Thanjavur town and sought their support for the AIADMK Congress(I) combine. Searching for an answer to the puzzle of the non-Brahmins appealing the 'miniscule' and 'barely three per cent' takes us once again to Mani Shankar Aiyar. In his *Sunday Observer* essay, he notes, he had more enemies than K P Kalyanaram and also more friends than chicken biryani.

Travellers from distant metropolises would bring to remote Mayiladuthurai headlines from 'national' newspapers, solemnly informing me that Mayiladuthurai was no cakewalk, that I was 'skating on thin ice' and (to complete the composite mixed metaphor) that I was fighting with my 'back to the wall'. I would get flabbergasted, alarmed and despondent in turn, wondering what it was these correspondents knew that was escaping my eye. And then comfort myself with the thought that even if the English 'nationals' were predicting my doom, the Tamil press was veering around to my side. *Kalki* proclaimed that "Mayiladuthurai is in Mani's pocket." *Ananda Vikatan* enthusiastically affirmed that I spoke only in Tamil—and the best 'Thanjavur Tamil' at that. Eventually, the most fulsome tribute to

my campaign came in the Madras edition of *Indian Express*. A six-column spread of pure manna on the very day of the polling. Thankin' you all.

Kalki, *Ananda Vikatan* and *Indian Express*, among others, will always be on the side of Aiyar. *Ananda Vikatan* will never fail to affirm—not merely, but 'enthusiastically'—that Aiyar spoke the best Thanjavur Tamil, even if he protests that it is not so. (In fact Aiyar admits with that arrogance of the English-knowing, that "if Kalyanaram claims to know English, his level of English was exactly equal to my level of Tamil.") *Indian Express* will allot endless six columns for the worthy cause of Aiyar. The reasons are not far to seek. While Mani Shankar Aiyar will characterise them as the 'Tamil press', for years the politically aware Shudras of Tamil Nadu have been seeing them as the Tamil Brahmin press, the day-to-day Manus of the technological computer age. As an illustration, let us take a recent editorial of *Kalki* (May 5, 1991) on Kanchi Sankaracharya's 'padavatra' for communal harmony. The opening sentence of the editorial was categorical: "Caste divisions and religious differences are the first enemies of the nation." It went on to congratulate Ambedkar for reaching positions of eminence without the aid of reservations. Importantly when it turned to politics in Tamil Nadu, it found three parties to be rebuked. Pattali Makkal Katchi, the non-Brahmin party popular in the so-called Vanniar belt, the Dravida Kazhagam and the DMK. It waited. The leader of the Pattali Makkal Katchi is saying 'My motto is to make a Harijan the chief minister.' The DMK's camaraderie continues with the Dravida Kazhagam which thinks, its duty is to create hatred against the Brahmins. It however did not have a single word against all those virulent AIADMK supporters of the Brahmins. That is what Mani Shankar Aiyar's 'the Tamil press' does.

'The Tamil press' that is exactly where the power of the 'barely three per cent' lies, making K A Krishnaswamy and R M Veerappan fall in line. For over a full year,

day after day, tirelessly, they overworked their propaganda machine, 'the Tamil press', and campaigned that the Shudra-led DMK was a party of anti-nationals, collaborators of the LTTE, protectors of gun-runners. They told the people exciting tales about how Tamil Nadu had, under the DMK rule, become one of the biggest centres for arms trade and AK 47s were being auctioned off in bulk in the lane and by-lanes of Thanjavur. The DMK whose armoury never had anything more than those traditional weapons such as soda water bottles and cycle chains, was effectively projected almost as a party of terrorists. (In fact, the armoury of the DMK has shrunk over the years and its cadres no more carry live snakes or earthen pots to be let out in public meetings of other parties.) The DMK's self-serving opportunism and ambivalence towards the Sri Lankan Tamil question was ironed out and it was made to look like a party of constant supporters of all kinds of mindless violence in the name of the Tamil cause. In contrast, Aiyar's Tamil press played down and even silenced the role of the AIADMK and the Congress(I) in promoting the Tamil groups with money and political patronage. The 'barely three per cent' saw to it that the DMK's fate was sealed even before the electoral process began. Hadn't the DMK stepped on their toes by its anti-Brahmin rhetoric and by its electoral support to the Mandal Commission? The same ones knew, to survive is to support the inconsequential Brahmin.

The moral of the story is rather simple even in electoral politics, where numbers are supposed to count, the miniscule Brahmins can tilt the scales and they continue to do it.

Tailpiece Jayalalitha Javaram, the first Brahmin to become the chief minister of Tamil Nadu after the 1950s, has announced a chief minister's fund to protect and renovate Hindu temples. She, as the first one to contribute to the fund, has given Rs 1,00,008—this number is of course, the numerological variant of 108, one of those auspicious numbers in Hindu faith.

Crippling of BCCI

A Study in Finance Capital

Frederick F Clairmonte

The conflagration within BCCI is not the first and will not be the last in an era of global liberalisation of financial services in which avarice has no bounds. Deregulation of financial services now propounded in GATT by the US and others is fraught with catastrophic consequences, and not only for the third world.

THE script on BCCI's meandering pilgrimage is not yet finalised; and there is no chance that a balanced historical record will ever surface. The ranks of global finance capital whose numbers have thinned over the last decade, and have now become too imbricated and monstrously corrupt suggest that there is no possibility that facts will be sifted from fiction; truth from obnoxious cover-ups. Recent precedents are too appalling to be sanguine on this score. The BCCI imbroglio already has the makings of a Hollywood mega-extravaganza which, with some Ramboesque ingredients, possesses the potential to beat 'Dallas', 'Dynasty' and their likes to a frazzle. All such wonders enacted beneath the triumphal arch of Desert Storm.

The concoctions have all the makings of a north-south morality play with dark skinned West Asians (not inappropriately the mulatto Noriega is dumped into the cast) and their villainous accomplices. Opposing their villainy stand the knights in shining armour upholding the rectitude of Anglo-Saxon banking principles: the Bank of England, the Federal Reserve Board and a spate of US Senate investigators, the latter rushing frenziedly to cash in on the televised bonanza.

Doubtless a crude schematisation, but what we are seeing is that the ideological engineers have already cranked up the engine. *Time's* incantations are redolent of the vitriolic shrieks at the acme of the cold war ('The Dirtiest Bank of All How BCCI and Its Black Network became a Financial Supermarket for Crooks and Spies', *Time*, July 29, 1991). There the BCCI is depicted as a black network whose crimes were all-encompassing: espionage, embezzlement, extortion, terrorism, murder, etc. Is there anything left to say?

Robert Morgenthau, Manhattan's district attorney, dons the mantle of the prince of ethics. BCCI's malpractices are categorised as "the largest bank fraud in world history". The indictment contends that it falsified its capital structure to make it appear as though it were a solvent and profitable bank, whereas its capitalisation and assets were fictitious. In its turn, the Federal Reserve Board

ejaculates that it embezzled \$ 20 bn from depositors by falsifying bank records, as well as illegally acquiring US banks. But that is only the *hors d'oeuvre* of an indictment that runs to over 200 pages.

BCCI's grave irregularities, however, cannot be discarded as mere humbug. But why was BCCI singled out as the nigger-in-the-woodpile? Its crookedness goes well beyond the accounting wizardry and banking stratagems of a small-scale actor in international finance. The totalitarian universe of finance capital is one dominated by around 50 TNC colossi headquartered in six countries. With the possible exception of the Kuwait Investment Organisation (KIO) there are no third world banks of international scope.

These financial behemoths are the determinants of interest rates, as well as the conduit for trillions of dollars of foreign direct investments. The international financial system, strikingly so with the hurricane velocity of deregulation, a device *par excellence* for boosting concentration, is now more rigged than it ever was. To speak of BCCI's malleance as the biggest bank swindle of all times reeks of self-righteous hypocrisy, it betrays the total absence of a sense of perspective; notably so in a land agonising under the most gruesome financial swindles of all times: the Savings and Loan cataclysm gouging the US taxpayer over \$ 550 bn.

The Federal Deposit Insurance Corporation (FDIC) is broke. Poor Seidman has now felicitously flung himself from the sinking ship. Superimposed on this is the sustained putrefaction within every nook and crevice of the US banking, insurance and other financial sectors that exhibit no symptoms of winding down. The recent skulduggery of Solomon Brothers (by far the biggest US treasury bond dealers) involves tens of millions, but that's only a starter as the numbers have not been totted up.

At the individual level nothing highlights more cruelly the plight of millions of American savers than that of a 76-year-old woman that slugged Keating (one of the most notorious S and L crooks) in the face in the courtroom at the start of the S and L trials, and hollered: "You dirty dog; you stole all my life sav-

ings. I've got nothing now." That desperate lady is one of millions whose savings were pillaged, in a land where social security safety nets have been slashed to the marrow; a country with a plethora of legal provisions, which do not function, or function wretchedly.

TNC banks, once again superbly exemplified in Japan Inc, have flouted national legislation. They function outside of any national jurisdiction. Their balance sheets, as even the most junior clerks in the City and Wall Street, know, are the vilest of fabrications stemming from a myriad of criminal wrong-doing, not least, transfer pricing, evasion of tax and currency laws. The multi-billion dollar accounting scams are systemic to the 'normal' functioning of finance capitalism. This has nothing to do with ethical aberrations.

And for such 'normality' the third world is bleeding profusely. Due to TNC complicity in capital flight and other transactions, outflows from the third world easily outstrip \$ 200bn yearly. What has given a new twist to these pillaging techniques are technology strides that transmit billions of dollars around the world with the flip of an electronic button. In the decade of the 80s, the worldwide stock of foreign investments exceeded \$ 1,500bn, transacted by a minuscule number of mega-financial conglomerates. These numbers are gross underestimates as they represent the IMF's recorded flows. In contrast, the unrecorded flows are an estimated \$ 600 bn. Throw in another \$ 225 bn from global narcotics transactions, and you are dealing with very big money. From this perspective, the notion of a global liquidity crisis is a myth.

Although BCCI is involved in almost all financial and commodity transactions, its bite in these licit and illicit aggregate transactions is denisory. Seen in the spectrum of balance sheet engineering, there is nothing complex at all in laundering narcotic money and concealing cash flows. What is vital in the international banking business are political connections, one of BCCI's greatest assets. More crucial than a bunch of highly flexible chartered accountants and lubricious lawyers is that bankers of all colours need cronies in high places, normally high cost merchandise. Politicians as highly commoditised items lend themselves ideally to such transactions. Success or failure of a deal often hinges on this. BCCI had its genesis in 1972, when it obtained a licence to take deposits in its Luxembourg holding company, the Cayman Islands and London. From these strongholds its tentacles ramified worldwide.

FLOATING ON OIL

Like Kuwait's plunge into the unaccountable abyss of finance capital, BCCI was floated on big-oil money. Abu

Dhabi's Sheik Sayed al-Nahyan and his dynasty own 77 per cent of its shares. The BCCI (whose founder is a Pakistani) was never badgered at the Emirate level by quibbles of financial and political accountability. As in Kuwait, the seven-state United Arab Emirates had never made the distinction between the public and private purse. Hence, no indiscrete questions as to the motives and directions of the Emirates' cash flows. A fig leaf of national accounts does exist that presumably suffices to meet the World Bank standards of 'respectability'.

Also, as in Kuwait, the Emirate and BCCI were reinforced by their connections with the ex colonial power and the United States. Here the similitude grinds to a halt. Unlike the KIO, BCCI was a highly decentralised operation impregnated with financial populism. It was policies of this kind that aroused the ire of the British big banks, and subsequently the World Bank and the IMIs. In the UK, its competitive presence, exacerbated by its Middle East provenance, had always been deemed undesirable. In quick order, BCCI had acquired 1,30,000 depositors not all of them British Asians, and this at a moment when the scramble for depositor's savings had reached a new pitch of intensity.

BCCI hesitated (a major tactical error) to play ball with the UK banking cartel that rigs high interest rates, thereby devastating small UK entrepreneurs. Whether BCCI pursued these policies to conform to the ethical principles of Muslim banking, as Agha Hasan Abedi believed, or ultimately to acquire a latter market share, as his competitors stressed, is debatable. The British big banks are understandably euphoric with the crumbling of a ferocious competitor. Indeed, their thinking was perhaps not far removed from the legendary 'robber baron' Commodore Cornelius Vanderbilt (1794-1877) who thundered to one of his competitors: "You've undertaken to cheat me. I won't sue you, for the law is too slow. I'll ruin you" (*The Robber Barons* by Matthew Josephson, 1934).

Global geo politics also played into the hands of BCCI's enemies, prior to and particularly after August 2, 1990. It was stigmatised as a foreign body, anathema not only to British banking, but to British national interests. On the external front, it drew the fire of the TNC banking network and the World Bank. By its accessible credit policies it was charged with not playing the game. What BCCI's critics ignored was that its policies, in Africa in particular, were not formulated at the apex of the decision-making pyramid, but frequently at the grassroots managerial level. Analysed in this niche, BCCI emerges as a decentralised operation, due to policy and ideological divergences within the bank.

Also, it did what TNC banks normally

never do: embark on joint ventures with majority participation by African countries. In Zimbabwe, the government had a 55 per cent majority share, and in most African countries it continues to operate. The stance of the governor of the Central Bank of Sri Lanka is one shared by many third world countries (including India): "We will not be guided by what happens abroad. The bank will thus continue to function irrespective of what happens overseas" (*Financial Times*, July 30, 1991).

Its sectoral investment policies in many African countries ran against the grain of TNC banking policies. Investment in peasant farming covers long gestation periods with exiguous returns. There are many such projects in the joint-ventures in both east and west Africa. It is here that the contradictions within the BCCI become painful. BCCI was sucked into the cold war vortex from its inception by the masters in Abu Dhabi. William Casey was the master orchestrator. Before taking up Reagan's appointment as CIA boss he had been a Nixon appointee as chairman of the Securities and Exchange Commission, a fox called in to protect the chicken coop. Before that, he was a big time international financier and real estate tycoon, huge real estate holdings in Central America.

The deals, political and financial, struck between the autocracy in Abu Dhabi and the CIA, pushed BCCI into a lethal orbit. It contributes also to explain BCCI's phenomenal growth between 1975-1985. A conspiracy theory does not provide the answer to BCCI's indomitable because there is no single spider at the epicentre of this web of influence, peddling and money making. Casey was possibly the nearest thing to being the spider, but he doesn't quite make it.

Under Casey, the CIA redesigned entirely its corporate data base modelled on that of the Sogo Shosha embracing all large and medium sized international firms. Dossiers on firms' official and unofficial business are permanently updated; a firm's political connections, its off the books expenditures and income, and managements willingness to accommodate the CIA. At any appropriate moment, the firm's financial entails can be cycled or re-cycled. Staffed by a mighty array of professionals at Langley and abroad, this Frankenstein will ominously remain Casey's mightiest contribution to the US economic intelligence gathering and its policy effective sequels. BCCI was one of his most brilliant proteges.

Casey's favourite dictum was "We work on both sides of the street, and all parts of the street." Geo politically, BCCI was ideally positioned for the game. At any time, it is imprudent for any firm with US subsidiaries (and not only within the US) to spurn 'The Company' as a suitor. Such recalcitrance could trigger enquiries

by the Internal Revenue Service (the supreme US tax man) of the firm's finances, to be extended, if need be, to management echelons. An operation effectuated without the firm even knowing by and for what reasons the enquiry was set in motion.

Afghanistan was the greatest boon to BCCI's fortunes. All Saudi and Egyptian funds were funnelled almost exclusively through BCCI. Casey made it clear that although the CIA had a \$ 30 bn annual budget (the official number is nearer \$ 50) its operations would have to be funded by others. As it turned out, the petro-autocracies and the sultan of Brunei not only bankrolled the 'Mujahadeen' but CIA operations as well, in Pakistan and Afghanistan. How in heaven's name could the Bush cabal have the temerity to riposte that it knew nothing of such transparent forms of financing?

A stunning precedent was set, and once again it was Casey's grand celebration, a momentous event in the making of Bush's New World Order. The Iran Contra funding operation in which, once again, BCCI excelled was a corollary built on the Afghan precedent. There was not a bank in Islamabad, Rawalpindi and Karachi that did not get their cut from every licit and illicit transaction with the Mujahadeen and their mentors, the Pakistani intelligence agency. To be sure, the Pakistani politicians and senior police officers were never left in the cold. In addition to his huge Saudi personal subsidies, Zia got a cut on all bank transactions, and not only that of the BCCI in which he had been accorded a 3 per cent equity stake.

The Reagan-Bush junta owes a priceless debt to the cold war commitments of BCCI and the West Asian banks. More so than the corralling of Anwar Sadat, it remains Casey's crowning glory. The Afghan war succeeded beyond the wildest expectations of Pentagon planners in bleeding Soviet finances; it didn't leave a dent on US finances. The masterstrokes of the CIA-BCCI duo was one that would be applied elsewhere in the third world.

The conflagration within BCCI was not the first and will not be the last in an era of global liberalisation of financial services in which avarice has no bounds. Deregulation of financial services now propounded in GATT by the US and others is fraught with catastrophic consequences, and not only for the third world, joined to the wholly unaccountable, inhibited concentration of these massive aggregations of economic power. This demonic conjuncture can in no way make for greater stability. Ineluctably, it will entrain in its wake even more ghastly manifestations of which BCCI is but a foretaste.

Strengthening Public Accountability

Can 'Exit' and 'Voice' Help?

Samuel Paul

This paper presents a theoretical framework for analysing the problem of government's accountability with special reference to public services. An important proposition derived from this framework is that effective public accountability can be sustained only when government's 'hierarchical control' over public service providers is reinforced by the public's willingness and ability to 'exit' (the presence of competition) or to exert pressure on the providers to perform (the use of 'voice'). The paper also examines the conditions under which the use of exit and voice is likely to be efficient and offers a menu of options to strengthen public accountability.

THE objective of public accountability is to promote the congruence between public policy and public actions and services by holding those involved responsible for their performance. In general, public accountability refers to the spectrum of approaches, mechanisms and practices used by a government to ensure that the activities and outputs of its constituent parts meet the intended goals and standards efficiently. At the national (macro) level, a government may be held accountable for its policies, actions and processes (public expenditures, programmes, budgetary process, etc.) through a variety of mechanisms such as elections, legislative reviews, and public expenditure audits. The concept of accountability applies equally well to all levels of government (central, state and local), to public enterprises and to other public agencies that deliver public services to citizens at the micro level, individually or in groups.

There is growing evidence to show that the existence of macro level accountability systems does not guarantee micro level accountability, i.e., at the level of specific public services that affect the citizen. Indian experience bears eloquent testimony to this phenomenon. In spite of democratic elections, audit of public expenditures and parliamentary oversight of government programmes, neither citizens nor governments in power are able to hold public service providers (e.g., in services such as health, education, electricity, transport, etc.) accountable for their performance. The expansion and increasing complexity of public services have so overloaded the public accountability systems at the national level that they are unequal to the task of ensuring accountability at the micro level.

Public accountability involves three groups of inter-related stakeholders. The public and the customers of public services (often a subset of the public at large) are stakeholders interested in service providers being accountable to them for attributes that benefit them most. Political leaders who control government processes and bureaucratic supervisors of service providers are stakeholders who would like the latter to be accountable to them for a mix of public policy and possibly private or parochial goals that interest them. It is the pursuit of private goals by some or all of these stakeholders that results in rent seeking ac-

tivities. Service providers themselves constitute a third category of stakeholders with objectives and interests often different from those of the first two. The public accountability system that finally emerges invariably tends to reflect the relative bargaining power of the different sets of stakeholders involved. Whether public policy goals will be neglected to facilitate rent seeking activities, for example, will depend on who dominates the bargaining process and what their interests are. When those engaged in governance are seen to monitor performance measures consistent with public policy and are motivated to pursue the attainment of public welfare, an effective public accountability system can be expected to exist.

The phenomenon of capture – the tendency of some of the stakeholders (e.g., the elites among the service recipients and those who manage and control the allocation of public services) to appropriate an undue share of the benefits and to engage in rent seeking – is an important barrier to the improvement of accountability in developing countries [Buchanan, et al, 1980, Tirole 1986]. Capture, along with government monopoly of many public services, the limited capacity of the public to demand and monitor good performance, and the problems in measuring and quantifying the benefits of services, make the improvement of public service accountability an especially complex and difficult undertaking.

The concept and practice of public accountability have been greatly influenced by political theories and the professions of public administration and law. They have evolved in the more developed countries in parallel with their socio-political evolution [Jabbar and Dwivedi 1989]. While there have been variations in this evolutionary process, the following landmarks deserve to be noted.

(1) Democratic accountability was the starting point for many countries in the course of the last century. This represents a mix of political (parliamentary) and administrative accountability. The government (ministries, the bureaucracy and its constituent parts) in this system is accountable to the political leadership (elected or otherwise) of the country for its actions and performance. Ministers, for example, are accountable to the parliament/legislature in democratic

countries. Civil servants in turn are accountable to their ministers. Accountability here is a macro level concept with a strong focus on government wide actions and processes. It is difficult for a minister or legislature to supervise or control the individual acts of all civil servants and their departments. It is assumed under this approach that the internal controls of the bureaucracy will ensure the accountability for specific public services. The instruments of macro level accountability include legislative reviews of ministry activities, periodic audit reports on public expenditure, and the practice of questioning ministers in parliament on ongoing government activities. Political leaders/legislatures act as surrogates for the public in the system of democratic accountability. Democratic accountability is applicable not only at the national level but also at the local level. The focus is on the totality of a political unit. Over the years, democratic accountability systems at the central level have been heavily overloaded even in the more developed countries, eroding their effectiveness in the process.

(2) The expansion of public services which required technical expertise in their production and delivery subsequently led to the practice of *professional accountability* in the public sector. The experts (doctors, engineers and other specialists) involved in these tasks are guided by their professional norms in being accountable for the services they provide. They exert considerable autonomy in defining the public interest on the basis of professional norms, and in deciding on the nature and content of the services. The criteria of accountability here are heavily influenced by the norms internally agreed upon (from the supply side) by professionals acting on behalf of the public. This type of accountability at the micro level has much broader application in the context of specific services than is true of the concept of democratic accountability discussed above. It did not supplant democratic accountability, but acted alongside and as a response to the increasing complexity of public services.

(3) In recent years, judicial systems and specially devised laws in some countries have been used to augment the accountability of individual civil servants and units within government who are responsible for specific functions of government and for the production and delivery of public services.

The growing interactions of the public with the bureaucracy, and the dysfunctional impacts of secrecy and anonymity within government on the efficiency and effectiveness of services have contributed much to the emergence of the *legal accountability* concept [Smookler 1989]. By and large its practice is confined to the more developed countries with an educated public and a democratic political system. Its evolution is associated with the public's right to seek information from government, the right to sue individual civil servants and public agencies in law courts and the power of courts to make the latter financially liable for violations of the public interest.

This pattern of the historical evolution of public accountability reveals three interesting features. (1) The original thrust of government accountability to the public rested with the political leadership at the macro level. The rise of democratic or parliamentary accountability did not lead, however, to an automatic improvement in micro level accountability even in developed countries. The expansion of the role of the state and of public services in particular was such that macro level accountability mechanisms were unable to cope with it. Attention to micro level accountability mechanisms to control the behaviour of agencies and their staff in the context of public service—a relatively recent development—was in part a response to this problem. (2) The focus of the key instruments and measures used to ensure public accountability has traditionally been on inputs and not on outputs. In most cases, the latter tend to be diverse and too complex to measure and to aggregate though in recent years there has been some progress on this front. On the other hand, public expenditure which is an input and a common denominator can be easily measured and audited. Internal processes can be assessed as there are generally uniform norms about their use within government (e.g., the sequence and procedures to be followed for decision making and implementation of decisions). (3) Except for legal accountability a recent development, the primary concern of the concept of accountability has been on internal means of control. Political leaders, agencies and bureaucrats act as proxies for the public and hold those reporting to them accountable through control systems within the relevant organisations. Hierarchical control is not, however, an effective device to promote accountability especially when collusion between supervisory and subordinate personnel is likely and the complexity of operations limits transparency. The dominant pattern has thus been one of vertical or 'upward' accountability and not of 'outward' accountability. The key missing element here is the view of the public as 'customers' to be served. The macro level 'upward' accountability system can provide the framework within which this missing element can be located and nurtured. But it is not a sufficient condition for the emergence

of 'customer orientation' (an important aspect of accountability in public services) at the micro level. As shown below, micro level accountability mechanisms can be used to strengthen the overall public accountability in a society. Macro and micro accountability are thus mutually reinforcing.

I Reinforcing Accountability through Exit and Voice

While the concepts of democratic, professional and legal accountability are essential for good governance in any country there are two other factors that are particularly relevant for strengthening the accountability for public services in developing countries. These factors assume special importance in light of the evidence that macro level accountability systems are getting overloaded and are unable to do justice to public service accountability at the micro level. One is the extent to which the public has access to alternative suppliers of a given public service. The question here is whether there is potential or scope for the public to exit when dissatisfied with a public service. If exit by the public has an adverse impact on the public agency involved, as for example, by reducing its revenues or threatening the careers and pay of its staff, it can have a salutary effect on public accountability. The second is the degree to which the public can influence the final outcome of a service through some form of participation or articulation of protest/feedback (individually or through organised groups) irrespective of whether the exit option exists. If *voice* affects the behaviour of the public agency concerned and makes it more responsive to the public, then again, public accountability may be enhanced. Exit is ubiquitous in the competitive market place whereas voice has traditionally been found in organisations such as political parties and voluntary agencies.

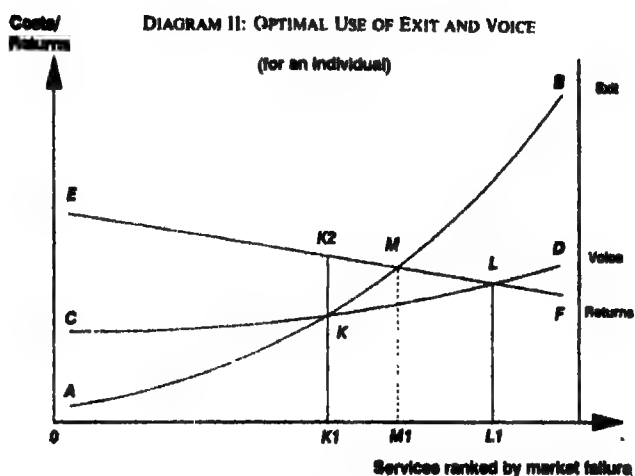

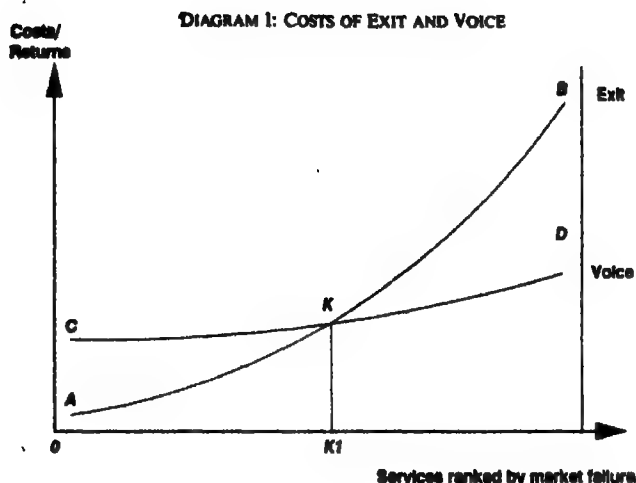

Exit and voice are terms that Albert Hirschman [1970] made popular in his excellent discussion of the ways in which consumers cope with the problem of performance deterioration in the production of goods and services.¹ He treats exit as an economic response mechanism and voice as a political response mechanism. The former is ubiquitous in the competitive market place whereas the latter is found more often in organisations such as political parties and voluntary agencies. The analytical framework of accountability presented below builds on Hirschman's concept of exit and voice but with an exclusive focus on public services. Two interrelated questions will be explored here. Under what conditions are the exit and voice options likely to be efficient in enhancing accountability in public services? How and why do public services differ in their amenability to the use of exit and voice as a means to improve their performance? Answers to these questions

are essential for designing better approaches to public service accountability.

Diagram I provides a simple, but generalised answer to the first question. The public's decision to use exit, voice or a combination of both will depend on two factors, namely, the expected returns resulting from improved accountability (e.g., better quality, reduction in delays and corruption, responsiveness or other attributes that the public value, etc.), and the costs associated with the use of exit and voice. The relative costs of exit and voice and their levels may vary depending on the degree of market failure affecting the services.² Market failure here is treated as external to the service provider and is caused by externalities, decreasing costs (e.g., natural monopoly) and informational asymmetries. In Diagram I, costs and returns are measured vertically while public services are ranked horizontally according to the increasing intensity of market failure.⁴

Assume that the public is willing to use exit and voice in order to improve public accountability. AB represents the cost of exit associated with each of the services on the horizontal axis and incurred by an individual (a member of the public). CD is the cost of voice estimated on a similar basis. Although the cost of voice is often incurred in a group, each point on the curve could be treated as the individual's cost of voice. As expected, for the public, voice costs more than exit for the range of services facing competition, but as market failure increases, exit becomes more costly than voice. The cost of exit is clearly more sensitive to market failure than the cost of voice. For example, the cost of creating an alternative (exit) in the face of a natural monopoly will be enormous. The cost of organising the public to seek changes from the monopoly (voice) will also be substantial. But even the cost of voice tends to go up as the information asymmetries associated with market failure increases along the Y axis. Diagram I shows that the public services within the range of OK will find the use of exit more efficient for improving accountability whereas the services to the right of K will find voice more efficient. When city transport services permit both public and private options, the public will tend to use exit, while faced with urban water supply problems the public is more likely to resort to voice.

Diagram II introduces the concept of the expected value or returns from performance improvement to the public that improved accountability can bring about. EF represents the expected returns to the individual of such performance improvement. Its declining slope signifies the increasing difficulty in improving accountability as market failure increases. A monopoly, for example, is expected to be less responsive to public pressure. Upward shift in the expected returns curve can occur, however, when supervision or incentives are strengthened to make the service provider more

responsive.⁵

Given the exit and voice cost curves, Diagram II shows that the combinations of exit and voice that are efficient for different goods will vary depending on the level and slope of the expected return curves. Thus when EF applies, both exit and voice yield net returns along the range of OK1. Nevertheless, exit is clearly the more efficient option. Within the K1M1 range of services, voice is the superior option though up to M, exit continues to yield net returns. For services beyond OL1, neither exit nor voice seem efficient solutions though an upward shift in the returns curve can reduce their number. Public services can thus be partitioned into three categories by reference to the net returns to performance improvement generated by the use of exit and voice.

Four propositions follow from this simple diagrammatic presentation: (1) Exit is more efficient, and hence more likely to be used in services least affected by market failure whereas voice is relatively more efficient as market failure increases; (2) For many services, either option or a combination of the two will still leave some net returns and therefore the choice may depend also on the preferences of the public for different combinations; (3) The level of expected returns has a direct bearing on the extent to which voice will be deployed especially in the range of services most affected by market failure. In other words, the public is likely to use voice only when there is a high probability that the public sector will be responsive and make this investment worthwhile; and (4) There are some public services for which the use of neither exit nor voice mechanisms will be efficient. If an upward shift in the returns curve occurs, a decline in their number will follow. These are the services most affected by market failure.

BARRIERS TO EXIT AND VOICE

Whether exit is feasible in the context of a public service will depend on several factors. First of all, economies of scale are important in the production of many public and quasi-public goods. Natural monopolies

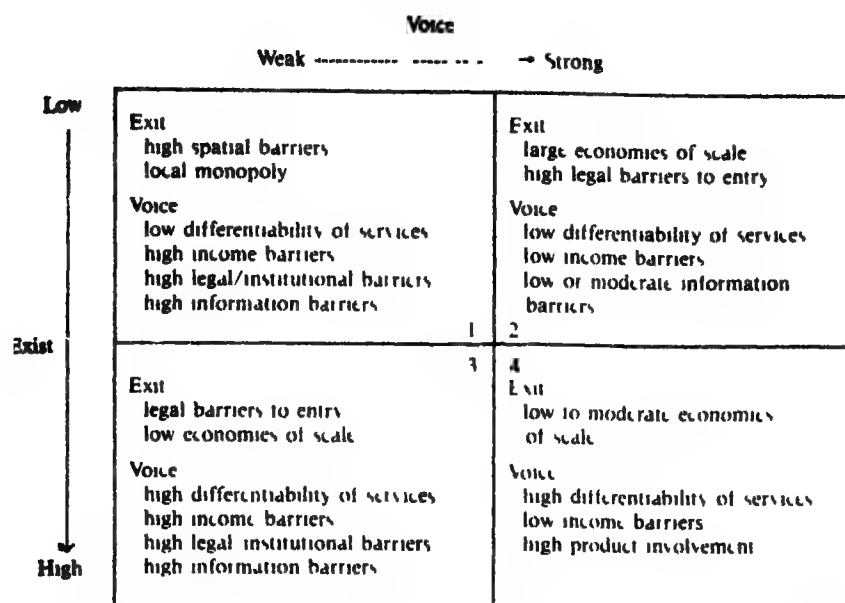

with increasing returns to scale are well known examples. In a country or a geographical area where there is scope for only one enterprise or agency to produce and deliver a service, the public's potential for exit is limited or non-existent, and hence exit cost is high. Second, legal barriers to entry may exist in a country which limits the public's scope for exit. Registration of vehicles and trade controls can be viewed as legal barriers which the public cannot escape unless illegal action is resorted to. In many countries, barriers to entry in sectors such as road and air transport and education illustrate this point. Third, spatial barriers may limit the potential for exit for some segments of the public. Here the problem lies not in the nature of the good or service but in the characteristics of the public. Thus there may be scope for only one small school or health clinic in an isolated village. The constraint is not the existence of scale economies, but rather that certain features of the public (e.g., location) limit their potential exit. Migration by people facing poor performance, of course, is a form of exit, but a costly one under these circumstances. Finally, where the nature of a good or service is such that no member of the public can be excluded from access to it, exit by definition, is ruled out. Pure public goods such as defence or environmental protection are classic examples.

The barriers to the use of voice are also several. First, legal and institutional barriers to voice may exist in a country thus making it difficult for segments of the public to use their voice in support of accountability. In some cases, this could be traced to the nature of the larger political system or ideology. Even where an open or democratic political system exists in a country, its laws and legal and institutional systems may not permit or may constrain the use of voice (e.g., legal barriers to the recognition of user groups, lack of public hearings and denial of the right to sue public service suppliers). Second, informational asymmetries can be a severe constraint on the public's use of voice. Service providers often possess infor-

mation that is not available to the public. Governments may restrict the public's access to information or limit the scope for the media to challenge or publicise the poor quality and other attributes of services. Dissemination of information may also be limited by the poor technologies available in the country. Third, when services can be differentiated, the elites may be able to use their voice or other sources of power to get better quality services, excluding others in the process. On the other hand, non-differentiation of public services can aid the use of voice under certain conditions. A quasi-public good such as drinking water and public parks are non-differentiable products. Since all segments of the public have an interest in their supply and quality, those with a weak voice also gain from the voice of the stronger segments of the public. Fourth, income, education and related attributes of the public increase their ability to use voice. Even when information is available, lack of education may limit its proper analysis and use by the people. The cost of voice can be too burdensome for low income people. Fifth, the relative importance of a service to the public also influences voice. Thus if a person spends a significant proportion of his income or time on a service, or develops a continuing relationship with the service provider ('product involvement'), his incentive to use voice is greater than when the service is of little consequence or is not durable in terms of future relationships or benefits.

The foregoing discussion of the factors underlying exit and voice shows that both the nature of the good or service and the characteristics of the public exert an important influence on the use of these options. Natural or artificial (policy induced) monopoly turns out to be an important attribute of many public services (e.g., electricity, regulatory services) that tends to limit the public's scope for exit. The ability and willingness of the public to respond to this condition through voice can in part be policy induced (removal of legal barriers, information access, etc), but are also a function of

DIAGRAM III

certain attributes of the public (e.g., income, education, location, etc.) In the final analysis, the factors identified above influence the costs facing the public and thus their choices between the two options.

II

Combinations of Exit and Voice

Public services are categorised below into different groups according to the criteria of exit and voice. First, services can be classified according to whether there is scope for the public to exit if dissatisfied with what they get. This is a proxy measure for the feasibility of competition in the production and delivery of services. Second, public services differ in the degree to which their beneficiaries can make their voices heard if dissatisfied with the outcomes. For analytical purposes, Diagram III depicts four different combinations of exit and voice that provide a useful basis for the classification of public services. These should not, however, be treated as watertight divisions. As the vertical and horizontal arrows imply, they reflect degrees of actual or potential possibilities for the use of exit and voice. Examples of public services that fit the different combinations of exit and voice are given in Diagram IV.

Cell 1 (Diagram III) represents public services that fit the low exit weak voice combination. The nature of the services in this category is such that exit will be extremely difficult or costly for the public. At the same time, the beneficiaries involved are disadvantaged in the sense of being either poor or illiterate or both. Hence their weak voice. They have limited capacity to use voice if dissatisfied with the services. This can be exacerbated by legal, informational and institutional barriers. The public services in this cell can be produced efficiently on a

small scale (e.g., to meet the needs of a small town or village). While economies of scale are thus not a barrier, spatial barriers to exit tend to operate. To illustrate, a village needs only a single primary school which can be operated efficiently. If, however, some villagers are dissatisfied with the school's services, the exit option may not be open to them as the next school may be located in a far away place. Distance and not scale economies is the source of the monopoly condition present in this case. Furthermore, the public in this cell do not offer any scope for product differentiation. Health services, agricultural extension, rural water supply and regulatory services affecting the poor (e.g. licensing of vendors) are other examples of services which belong to Cell 1.

A combination of low exit and strong voice characterises Cell 2. Here again, exit for those dissatisfied with a service is impossible or expensive, but the scope for voice is considerable. Scale economies matter a great deal in the production and delivery of services in this cell. Natural monopolies owned or regulated by government illustrate the problem. Voice can be strong here for two reasons. Given the nature of the services, product differentiation is not possible or is extremely difficult to design with the result that the entire public gets more or less the same quality and type of service. Even if only a segment of the concerned public is capable of exerting voice, everyone stands to benefit from such action due to the externality effect explained above. Utilities such as electricity, telecommunications, urban water supply and irrigation are examples of services in this cell. Regulatory services affecting publics with a strong voice also belong to Cell 2 (e.g., industrial licensing, foreign trade regulation, etc.). The public here is capable of using voice on its own initiative. Organised groups of producers and consumers with strong interest in service out-

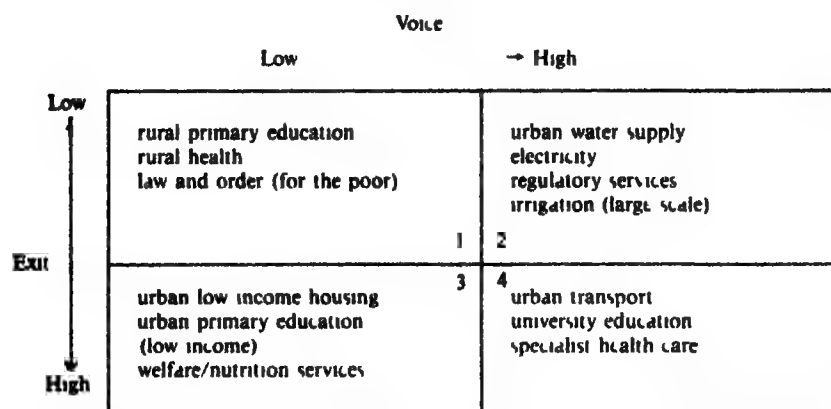

comes are found in these sectors at least in some countries.

If service characteristics such as product differentiation are in fact present in a service in Cell 2, the expected positive externality effect on the use of voice is unlikely to emerge. Thus when there is scope for product differentiation in a service, externalities enjoyed by the weaker segment of the public (low voice) will tend to disappear and the use of voice by the stronger segment will not improve accountability for all. Under conditions of extreme inequality, this may be the case in irrigation, for example, where large farmers could use voice to get a disproportionate share of water at the cost of smaller farmers. Similarly, in the case of electricity, the basic product cannot be easily differentiated, but the related elements of repair and maintenance can be differentiated between different segments of the public. Improved accountability here would still require the use of voice, but possibly with some external assistance for the weaker segment.

Cell 3 depicts services with a high exit weak voice combination. As in Cell 1, the services here are not sensitive to scale economies. This means that in a given geographical area like a city, several units can efficiently produce and deliver the services. When performance deteriorates, this will enable the public to exit provided multiple service providers exist. At the upper end of the spectrum in Cell 3, the scope for exit may be reduced through policy induced legal barriers to entry.⁶ Thus a government may permit education only under public auspices although voluntary agencies or private entities could provide this service. Product differentiation, however, is feasible in these services, thus making it possible for those with strong voice to opt for the quality they prefer. This tendency separates the segment of the public with weak voice from the former. Even if product differentiation is not present, policy induced legal, informational and institutional barriers to voice may also weaken the public's voice. Urban services which lend themselves to differentiation will fall into this cell, e.g., low income housing, and health clinics in poor areas. Between exit and voice, for the weak public in this cell, exit is the more efficient option though voice may play a supplementary role when policy-induced, informational and institutional barriers are eliminated.

Finally, Cell 4 refers to some of the quasi-public and private services that governments might provide under public auspices for a variety of reasons. Here, services are characterised by low to moderate economies of scale so that potentially several units could produce them in a given geographical area. As a result, the potential for the public to exit is high when faced with performance deterioration. The relative importance of these services to the public is high thus causing their 'product involvement' to be high. This, coupled with the fact that services can be differentiated for the benefit of the public with high income, education, etc., may

DIAGRAM IV

facilitate the use of voice by the latter. These services may often be the same as those in Cell 3, but differentiated for the higher income groups who normally can exert a strong voice. High quality schools, hospitals, and air transport are examples.

Some of the barriers and characteristics discussed above are natural whereas others are policy induced or political in nature. Economies of scale, spatial barriers, the relative importance of services, and infeasibility of product differentiation are natural factors. Some of the policy induced factors may originate in political discrimination or denial of rights, e.g., low income or education and some legal barriers. In general, political barriers are reflected in policy induced factors. Legal, information and institutional barriers, and income and education characteristics (to a large extent) are thus policy induced factors. Public services can be categorised in terms of the exit and voice potential they afford the public by reference to these barriers and characteristics.

The mix of barriers and characteristics in the four cells of Diagram III can be used to predict the degree of exit and voice potential that different public services can have. The basis of the prediction is an analysis of the services in terms of these characteristics/barriers and the extent to which they are natural or policy induced. There are, however, some services which are similar in nature between certain cells. This is because when provided to different types of population the same service can be characterised by differing degrees of exit or voice potential. For example, primary education is found in both Cells 1 and 3 of Diagram IV. Nevertheless, from the standpoint of accountability this seeming overlap does not imply a duplication. Contextual features and attributes of the public need not be the same even for identical services. An urban primary school, unlike a rural school, may leave an exit option for the public. If the relative importance of this service to a segment of the public is high (product involvement), voice may be resorted to before exit. This difference is relevant to the determination of the approach to accountability to be adopted. What distinguishes each cell is the positioning of a set of public services

in the context of a unique exit/voice combination.

A useful approach to the improvement of accountability is to devise ways and means to overcome these barriers or to minimise the adverse effects of some of the characteristics of the public discussed above. Clearly, natural factors are more difficult to overcome than those induced by policy. Exit and voice potential can therefore be more easily realised by first eliminating the policy induced barriers. Minimising the adverse effects of natural barriers will call for more time effort and resources. Judged by these criteria, services that the poor (weak voice) required and for which alternative sources of supply are difficult to find (low exit), will be the most difficult to deal with. Natural factors play a dominant role in causing this combination of exit and voice. The guidelines summarised below can assist in the choice of options when the services and the publics involved vary in their characteristics.

- (i) When a public service operates as a local monopoly in small and isolated communities and the public involved is characterised by low incomes and legal, informational and institutional barriers, improved accountability can be achieved through the use of voice.
- (ii) When a public service is characterised by large economies of scale and legal barriers to entry and its differentiation is difficult while the public involved or a segment of it is not constrained by low incomes and limited information, voice can be used to improve public accountability.
- (iii) When a public service can be differentiated but is not constrained by economies of scale in its production and the public involved faces income, informational and institutional barriers, improved accountability can be achieved through the use of exit.

III

A Menu of Options to Improve Accountability

There is a variety of exit and voice mechanisms available today that can be

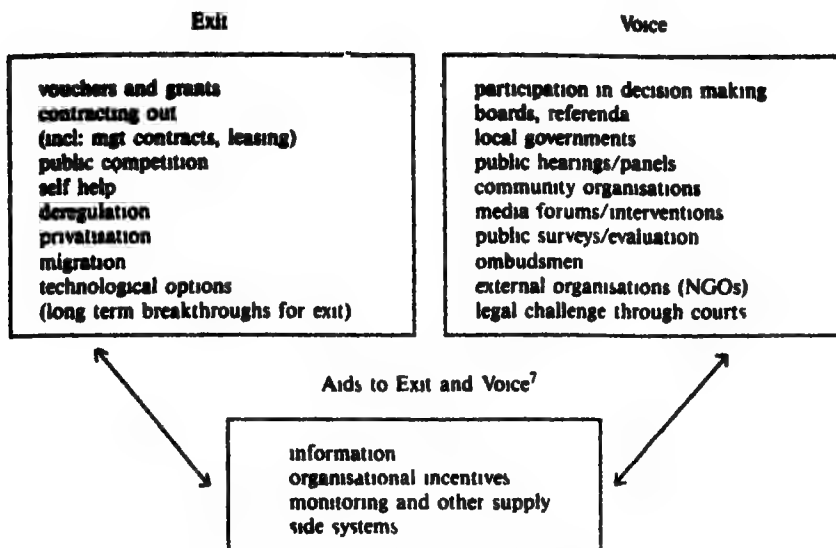

deployed to strengthen the accountability for public services. Needless to say, there is no standard recipe that can be applied as the choice of the mechanisms to be used will depend upon the nature of the services and the characteristics of the publics involved. A careful analysis of the context of the accountability problem must precede the choice of the specific mechanisms from the menu given below.

EXIT MECHANISMS

(1) *Deregulation of services* is an obvious option to consider since there is usually space for both public and private service providers to coexist and compete. For example, deregulatory measures in the education sector may induce the establishment of private schools along side public schools. Monopolies granted to trade agencies, when abolished, will encourage private traders also to enter the field. Since the public involved is poor (weak voice), the public function of regulation and possibly subsidisation is likely to continue. One option is to make grants to the private providers so as to minimise any adverse economic impact of deregulation on the poor. *Grants in aid* to NGOs have been used in both health and education sectors to achieve this objective. Food stamps or ration cards can be used for the same purpose in the area of essential goods distribution.

(2) If for various reasons certain services require close government supervision, *contracting them out* to multiple private providers can be another option. This approach would permit careful monitoring and quality control while affording increased scope for exit to the public. Municipal services of various kinds (garbage disposal, road maintenance, tax or fee collection, etc.), cargo handling in ports and equipment maintenance in railways have been contracted out in some developed countries. An important way in which this mechanism impacts accountability and performance is through its 'contestability effect'. When incumbents (even if they are monopolists) are made to bid for contracts along with outside competitors, they will be more careful about their performance and their terms.

(3) A more direct impact on accountability can be made through the use of *vouchers*. People who deserve special support for income or other reasons can now receive subsidies for certain services while choosing the service providers that meet their needs most efficiently. The administration of vouchers could be more cumbersome than that of grants to the service providers. On the other hand, vouchers are a superior mode for the exercise of exit in comparison to the grant system. Chile successfully replaced housing subsidies through low interest rates with the more direct subsidised method of a voucher programme [Howenstine 1986]. Under this system, beneficiaries pay for the value of a specified house with their own savings, the voucher and a credit obtained from commer-

cial banks at market interest rates. The voucher system will work effectively only when multiple providers exist, customers use the service frequently and are able to evaluate options, and the service providers have to depend on voucher receipts as a major source of revenue [Allen 1989].

(4) Where the private sector is not adequately developed, there may be a case for the public sector to continue to play a service provider role. Instead of outright privatisation, *public-private competition* may then be encouraged. For example, private banks may be permitted to compete with public sector banks. Both public and privately owned airlines may coexist.

(5) Though spatial barriers are the binding constraint on exit, it is possible that *new technologies* for service delivery can be used to augment the scope for exit. For example, under certain conditions, mobile courts, mobile schools and hospitals can cross spatial barriers and offer more options to the public in the fields of criminal justice, education, and health.

(6) An extreme form of exit is the *migration of people* in response to the dismal and persistent performance failure of service providers. Physical relocation by families in the face of malfunctioning schools, for example, is known to occur in several countries. Clearly, this is not an option that the poor can easily resort to.

VOICE MECHANISMS

(1) *Dissemination of information* about services can aid the public in demanding greater accountability from service providers. More systematic pressure can be exerted through a periodic public monitoring and evaluation of the relevant public services. This can be done under public or private auspices. An expert group, for example, can be commissioned to poll the beneficiaries or gather data from them as well as from the service providers for analysis and comparison across locations and over time.

Compared to the direct use of voice, this is less demanding and less costly for the public. Again, this is a surrogate for voice through external intervention and can use local media, NGOs and academic institutions. Its limitation is that such evaluation invariably calls for public resources. Public surveys have been used extensively in Australia, France, Canada and the Netherlands as a usable means of feedback on tax administration [OECD 1987]. Canada, for example, gathers feedback on taxation from clients on a continuing basis. In this context, transparency of the methods and data used and care in the dissemination and use of findings assume special importance.

(2) Complaints procedures and the institutional mechanism of the ombudsman are ways of providing voice to the people when there is no need or incentive for collective action [OECD 1987]. Here the attempt is to let individuals make known their problems to designated authorities for redressal. 'Hotlines' can be established to help the public respond fast to unsatisfactory services or decisions by public agencies. A review of international evidence in this area shows that these mechanisms are in place in many countries, but that their utilisation and impact vary widely. An important finding is that in poor societies, it is the elites who tend to use these devices more effectively. In Tanzania where the ombudsman did not evoke any response from villagers, a special effort was made to reach out by adopting a mobile approach, but with limited results.

(3) Yet another voice mechanism is the *participation of the public's representatives in the decision making bodies* of service providers. For example, users' representatives can be made members of the boards of directors or committees of these organisations. Where appropriate, users may hold stocks of utilities so that they have a stake in their management and performance. When legislation pertaining to utilities is being designed, public comment and participa-

tion of those interested in the proceedings could be encouraged. When local governments act as service providers, participation in their decision-making process can give voice to the public. In many developing countries, such use of voice or 'public participation' is conspicuous by its absence. Legislation is planned as an inter-ministerial technical process with no public involvement. Irrigation projects, for example, are typically owned and managed by governments. Yet, beneficiary farmers could be made joint investors, or made responsible for management and maintenance, thereby creating a strong incentive for them to demand and facilitate good performance.

(4) In developed countries, *public participation in the regulatory process* is an established practice. In the US, many regulatory agencies have a statutory duty to provide a forum for disputes arising in the course of the agency's rule making, or between those regulated and those affected by the actions of the industry concerned. Since public participation in this process was limited relative to that of the regulated industries, intervenor funding mechanisms have been created in some cases to deal with this imbalance. Another example of public involvement is in 'negotiated rule making' that brings together representatives of an agency and the relevant interest groups to negotiate the text of a proposed rule. Regulatory negotiation has been used by the environmental protection agency and other departments of the US government.

(5) Where direct participation of users in decision-making is difficult or inappropriate, it may be possible to consult them on important issues or to afford them opportunities to express their views on key decisions directly affecting them. *Public hearings* on the revision of rates in utilities is a good example of this approach. *Advisory panels* of a standing nature are another institutional mechanism. These devices can be set up by service providers or through regulatory agencies which are in any case necessary given the monopolistic nature of the activities involved.

(6) *Legal action* by members of the public or by consumer action groups against public service providers and their staff is an expression of voice that is becoming increasingly popular. Legal and judicial reform and improved access to information have facilitated the use of this relatively new voice mechanism in some countries. In this context, the decision of the development banks in India to set up consumer testing laboratories is a commendable and farsighted move to strengthen the voice of the public in dealing with both public and private producers of goods and services.

The exercise of voice is not only costly for the poor in terms of time and effort, but is also more risky than exit as the outcomes of voice are less certain. The poor are unlikely, therefore, to readily invest in the use of voice. Given the high costs of voice facing them, the endeavour should be to search for

voice surrogates. These are external agents who mobilise or organise the local public in order to demand and monitor better service performance. Non-governmental organisations (NGOs) are well known for playing this role. In some cases, they may act as service providers too. Media can also play a positive role in strengthening the voice of the poor. Their voice augmenting role tends to reduce the cost of voice to the local public who are generally poor and illiterate. Under monopoly conditions involving the poor, this form of cost internalisation by an external agency can tilt the balance in favour of the use of voice by the public. In health services, population control, and education, NGOs have played this role admirably in many developing countries. The alternative of a local community organising itself or influencing local governments to exert voice is also an important option [Paul 1987].

Improved accountability will result from the use of exit and voice mechanisms only when the latter cause the behaviour of the service provider to change. Since internal control is the instrument for achieving behavioural changes in the service provider, the condition to be met is that its monitoring and incentive systems are adapted in response to exit and voice mechanisms. This is important because if internal control has not been adapted, the public service provider's behaviour is unlikely to be affected and exit and voice would not have had their desired impact on accountability. With the use of exit, for example, some segments of the public may benefit by moving to private providers. The public service provider may still remain as inefficient and ineffective as before if it does not get the right signals through a responsive control system. A measure of the adaptation is the extent to which monitoring by the provider spans the efficiency, access and quality of service instead of being limited to inputs and compliance with internal rules. When such monitoring is reinforced by appropriate incentives to the provider, control can be said to have adapted to exit and voice. Voucher receipts or service fees as a major source of revenue are examples of signals in a control system that can positively influence the behaviour of service providers. If an adaptive response does not follow, exit and voice mechanisms may be further modified so as to give stronger signals to the provider.

IV

Implications for Policy and Action

Public accountability is an important determinant of the outcomes of public services. The poor performance of many developing countries in this area underscores the urgent need to strengthen public accountability. This paper has shown that the impact of accountability on performance can be augmented by moving away from an exclusive reliance on control mechanisms such as monitoring and use of organisational incentives to a system that uses exit or voice

mechanisms in conjunction with control. Whether the public will resort to exit or voice will depend on the relative costs associated with these options and the expected value to them of the performance improvement resulting from their use in a specific context. The costs and returns associated with exit and voice will in turn be influenced by the degree of market failure underlying the services in question.

Exit and voice can be expected to influence accountability both directly and indirectly. The contestability effect of some of the exit and voice mechanisms can have a direct effect on the behaviour of service providers. Through their impact on hierarchical control mechanisms, they can also have an indirect and positive effect on the same set of agents by keeping them 'in line'. It is difficult for an overloaded macro-level accountability system to have this effect on service provider behaviour in the absence of exit and voice mechanisms. The nature and extent of this impact will depend on the relative bargaining power of the multiple stakeholders *vis à-vis* the agents involved.

The factors that influence the potential for exit and voice in the context of different public services are several. The key characteristics on the exit side are the presence of economies of scale (monopoly), legal barriers to entry, and spatial barriers to exit. Voice potential is determined by legal, informational and institutional barriers, the public's level of income and education (and hence political power), the relative importance of the service to the public, and service differentiability. Some of these are natural barriers and characteristics whereas others are artificial or policy induced. Economies of scale, spatial barriers, the relative importance of services, and differentiability are natural factors. Legal, informational and institutional barriers, and income and education characteristics (to a large extent) are policy induced factors. Public services can be categorised in terms of the exit and voice potential they afford the public by reference to these barriers and characteristics. An analysis of the features and barriers of public services and of the publics involved can be used to predict the potential for the use of exit and voice in specific service contexts. This analysis along with the knowledge of the extent to which such features/barriers are natural or policy induced provide a basis for the design of new mechanisms for public accountability and improved service performance.

A useful approach to the improvement of accountability is to devise ways and means to overcome these barriers or to minimise the adverse effects of these characteristics. Clearly, natural factors are more difficult to overcome than those induced by policy. Exit and voice potential can therefore be more easily realised by first eliminating the policy induced barriers. Minimising the adverse effects of natural barriers will call for more time, effort and resources. Judged by these criteria, services characterised by weak voice

and low exit will be the most difficult to deal with. Natural factors play a dominant role in causing this combination of exit and voice. The implications of this analysis can be seen in the menu of options for improving accountability for services that fall under the different combinations of exit and voice potential discussed in Section II. A menu of options that fits the problems of the different exit-voice combinations is a more useful approach to the improvement of public service accountability than one that offers a standard answer for all situations. Some proposals for action are summarised below.

(1) If the power of exit and voice mechanisms in promoting public accountability is accepted, it follows that systematic attention to their identification and potential use must be considered at the design stage of programmes that are meant to deliver services with public good characteristics. During programme preparation, the barriers to accountability discussed above need to be identified and assessed, taking into account the nature of the service and of the public involved. While it is appropriate to strengthen the internal control system in a public agency, one should not assume that accountability for performance will follow simply because hierarchical controls are in place. Reinforcing accountability through a search for exit/voice mechanisms is essential especially in poverty oriented projects where diversion of benefits may not be difficult. Often, the mandates and behaviour of service providers are dominated by their own preferences or the priorities of their supervisors and influential elite groups. The weakest stakeholder is the public or its segments who do not have an adequate 'voice' for the reasons discussed in this paper. It is important to examine the kinds of exit and voice mechanisms that can be mustered to correct this imbalance. Since the costs and benefits of the different options tend to vary a great deal, there is merit in assessing a variety of experience in this regard. Innovations in the design of improved accountability systems must be informed by such evidence on the ground.

(2) In programmes whose outputs/services are meant for reasonably well defined publics (locationally or through targeting), there is merit in eliciting public feedback on government services periodically. The purpose here is to generate information as a basis for both the government and the public to learn, respond and adapt so that performance can be improved. A suitably designed public evaluation should not be a one time affair, but one that is undertaken periodically as a mechanism to enhance transparency and accountability. Task forces or committees of experts should undertake this assessment the findings of which should be publicly disseminated.

(3) In public utilities and other services where the exit option is unavailable, governments need to explore the scope for providing voice mechanisms to enhance account-

agency. Even where regulatory agencies have been set up to deal with monopoly situations, there is a case for increasing public participation. Public hearings, induction of non-officials/experts on boards/advisory panels, public access to important deliberations/meetings, and surveys of public satisfaction are some of the mechanisms that deserve attention. There is a strong tradition in governments of taking key decisions pertaining to such public utilities/agencies within ministries and in secret. Public hearings used to be a feature of the regulation of electric utilities in British India. After independence, the government seems to have abolished this practice. Public dissemination of key performance indicators and the use of local research institutions or media to undertake the comparative analysis and publication of such data and their findings will further reinforce the pressure for accountability.

(4) Voice mechanisms can be built into the device of the memorandum of understanding to improve the economic performance and accountability of a variety of public enterprises and other agencies. Efficiency measures play a key role in these contracts. But exclusive reliance on efficiency indicators may not cause accountability to improve in all cases. There are issues of the effectiveness of the goods and services covered by performance contracts that cannot be easily judged solely by these indicators. Thus if the quality or some other attributes of a service can be assessed only through user feedback, voice mechanisms may be the only valid basis to follow. From the accountability standpoint, a major gap in public agencies is the lack of monitoring systems to track the relevant performance dimensions. Often inputs and technical and financial aspects will be monitored, but dimensions that reflect public responsiveness and satisfaction (access, quality, reliability, etc), may be neglected. Public surveys of users may then have to be built into the contracts. This may be necessary also to counter the tendency of interest groups in large agencies to 'manage' technical data in ways that suit them and as a cross-check with other sources of data on the more difficult to measure attributes.

(5) Accountability at the micro-level will be sustained only when the government and the society at large are concerned and wish to improve governance. Comparative information on how different countries perform in respect of key public services can be a powerful tool to generate greater national and international interest in this subject. Selected indicators of performance based on good professional judgment can be assembled on these services from as many countries as possible for wide dissemination. It will provide the data for governments, scholars, media and the public at large to see where their countries stand in respect of the level and quality of their services. The public's awareness of these matters can often lead to an increased demand for public accountability.

Notes

[The views expressed in this paper are the personal views of the author.]

- 1 Exit and voice options can be both substitutes and complements to each other depending on certain underlying conditions which Hirschman develops in his book. He further notes that the cost of voice could be higher than that of exit in view of the need for collective action and the risk of the less certain outcomes of voice. While Hirschman recognises the relevance of these options to both private and public sectors, he focusses almost exclusively on the world of private goods where both options are readily available. Furthermore, he does not examine the issue of the relevance and design of institutional devices or arrangements for facilitating the use of exit and voice in varying contexts and the conditions under which they will be optimal.
- 2 This generalisation must be qualified in part. In politics, forms of exit do exist (leaving a party). While in the market, the use of voice is not unknown (a public demonstration).
- 3 The level of voice costs will be affected also by the prevailing socio-political environment. For example, a free press, dissemination of information, legal rights, etc, will reduce costs for the individual.
- 4 Note that services here differ only in respect of the degree of market failure. Strictly speaking, only one type of market failure should be considered at a time along the Y axis (e.g. natural monopoly). Needless to say, these are highly restrictive assumptions.
- 5 Returns are the monetary equivalent of the gains from improved accountability that the individual receives as a result of the use of exit or voice. The upward shift is treated here as an autonomous step, but need not always be so.
- 6 Note that scope for exit increases as one moves down vertically from Cell 1 to Cell 3.
- 7 Elements in this cell are the mechanisms of hierarchical control used by a public agency.

Accelerate Reform of Price Control

As I present my first statement as Chairman of your Company, I would like to record the deep appreciation of the Board for the notable contribution made by my illustrious predecessor, Mr. N.M. Wagle, during his association with the Company.

In the country-wide debate which is now taking place on the steps taken to tackle an economic crisis of unprecedented proportions, there is at last general agreement that sweeping structural changes are necessary to deregulate the economy. The government has taken commendable steps.

There are already some indications that the government is reviewing the Drugs (Prices Control) Order to reduce the number of drugs under price control and to revise the norms for fixing prices. What is needed now are sweeping structural changes of policy and a substantial dismantling of price control. **The objective to make drugs available at reasonable prices is unexceptionable. It is unrealistic under the present conditions to expect the industry to continually absorb higher costs and at the same time, produce and sell medicines at constant, and sometimes even at reduced, prices. Unremunerative pricing results in shortages.**

It is a matter of regret that the new industrial policy does not free drugs and pharmaceuticals from the shackles of industrial licensing. At a time when we are desperately short of foreign exchange, continuing restrictions over local production will compel the

country to spend this valuable resource on imports which could well have been avoided.

The decision to automatically approve foreign equity investment at 51% is, however, a move in the right direction which will be received with favour internationally. It is, however, important to remember that at present there are many competing claims on funds available abroad. The countries of eastern Europe will naturally receive greater attention from the investors of the West. In order to compete effectively with others to attract foreign investment, India will have to provide sufficient assurance to foreign investors that the return on their investments will not only be competitive but also that the projects for which their investments are offered will not be obstructed or held up by red tape and other political problems encountered in the past.

During the year under review, your Company has had to contend with a number of adverse factors common to industry in general. **The Gulf crisis and, more recently, the devaluation of the rupee have added fuel to inflation which is now posing a very serious threat to the economy. Naturally, it has also had its inevitable impact on your Company's performance.** Margins have been eroded steadily because of sharply rising costs which have not been compensated by commensurate price increases. However, growth in volume sales has been satisfactory, and intensive efforts have been made to hold margins by controlling costs of inputs and raising efficiencies. These have helped considerably to improve operating results.

I would like to express my sincere thanks to Glaxo Group U.K. on behalf of us all for its continuing support and expert advice which has always been given so freely and readily. Our thanks are also due to our joint venture partners PICUP and KSIIDC whose support for the projects in the states of Uttar Pradesh and Karnataka respectively is very valuable. I feel sure you will also wish to join me in thanking all employees for their contribution and hard work during the year.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting. For a copy of the Chairman's full statement and the report and the accounts, please apply to the Secretary, Glaxo India Limited, Dr. Annie Besant Road, Worli, Bombay 400 025.

Technological Capability under Economic Liberalism

Experience of Indian Industry in Eighties

K K Subrahmanian

The causality between liberalisation and growth performance and its impact on some qualitative aspects need to be carefully understood before adopting economic liberalism as the corner-stone of future industrialisation policy. This paper explores the direction in which economic liberalism affects one such qualitative aspect, technological capability, and finds that both policy regimes, regulatory planning as well as economic liberalism, could strengthen technological capability, though of different types.

AFTER going through a period of prolonged stagnation since the mid sixties Indian industry showed signs of recovery towards the close of the seventies and manifested buoyancy in growth in the eighties. The latter period also witnessed a swing in the development strategy away in emphasis from economic planning towards economic liberalism. Prima facie, it would appear that industrialisation in India is ingrained to the nature of macro economic policy regime. Some economists regard the protectionist and regulatory policies under planning regime as the basic cause of industrial stagnation witnessed since the mid sixties, attribute improvement in industrial growth in the eighties to the liberalisation of industrial licensing, import control and some other regulatory policies that helped create a somewhat competitive environment and recommend further doses of economic liberalism for the future industrial/technology policy so that the fuller play of market forces and external orientation will ensure a higher rate of growth. In contrast, there is a view that the stagnation was due to some structural constraints and improved performance in recent years coincided with higher rates of growth in public investment and domestic demand. Further the liberalisation is one of the major factors that may have contributed to the recent current economic crisis especially in the external sector of the Indian economy.

It seems that the causality between liberalisation and growth performance and certainly, its impact on some qualitative aspects need to be carefully understood before adopting economic liberalism as the corner stone of the future industrialisation policy. Among such qualitative aspects the one that is fundamental is technology as, "industrialisation is a process of acquiring technological capability in the course of continuing technological change".¹ This paper explores the direction in which economic liberalism affects technological capability.

DETERMINANTS OF TECHNOLOGICAL CAPABILITY

Technological capability is composed broadly of (a) the manufacturing capability (i.e., capability to manufacture goods and

provide services to given designs and specifications) and (b) the design capability (i.e., the capability to design changes in given products/processes or to design entirely new products/processes) in response to changing factor and product market conditions. This capability is enhanced in the course of technological change, which in a developing country context comes through a combined process of import of technology from developed countries and internal development through R and D activities. It can be conceived of shaping itself in response to technological behaviour of micro economic agents (e.g., the firms) in relation to import of foreign technology and indigenous R and D efforts in a sequence as classified by Fransman. Generally, a firm/industry in a developing country can improve its technological capability by moving along a technology dependence independence continuum i.e., importation of technology from foreign countries, internal R and D efforts for local adaptation improvements and innovations—and even export of technology.

Thus viewed the technological capability of a country can be argued to be a function of indigenous research and development (R and D), technology imports (TM) and the relationship between the two.² This relationship is a complex one. Technology import may either substitute or complement (or a combination of both) indigenous research and development activities. The literature on the influence of technology import on domestic R and D *per se* is rather scarce and the available empirical evidence on the nature of relationship between the two has been rather mixed.³ Some country studies have found the relationship to be complementary whereas some others do not lead to any firm conclusion. Also within the same country the relationship is of different nature in different time periods. In fact we have only rough ideas about the determinants of the nature of relationship which are firm specific, industry specific and specific to the economic policy regime. This is rooted in the lack of adequate empirical research on technological aspects of industrial growth.

As for the factors related to policy regime in determining the relationship between

technology import and domestic R and D activities (i.e., technological capability) the analysis of the macro industrial/technology policies and their influence in moulding technological behaviour of economic agents at micro levels may be a good starting point. In this context one may distinguish between the policy regime ingrained in (a) protectionism and (b) liberalism. The first one is based on the principles of economic planning and state regulations and is mainly inward looking in orientation whereas, the second one is based on market forces and is outward looking. To be more specific to the context of the present paper, it should know whether or not economic liberalism encourages the micro economic agents (i.e., the firms in the manufacturing sector) to strengthen their internal technological capability?

In the Indian context, it has been argued that the network of government controls under the planning regime and particularly, the selective technology policy with regard to import of foreign capital and foreign technology denied the firms the free access to import fast changing technologies from advanced countries and thereby contributed to their technological stagnation. In contrast, some doses of economic liberalism introduced in the eighties facilitated liberal import of foreign capital and foreign technology across the board and encouraged participation of transnational corporations in specific industries and in particular in the export sector. These policy changes moved the then inward looking industrial/technology system towards one that is more open to market forces and foreign participation and enabled the firms to acquire modern technologies and thereby attain higher output growth.

Clearly the firms must have been incurring substantial expenditure in connection with technology imports and imposing increasing burden on the country's external balances in the eighties. There is also another interesting aspect to economic liberalism. This is to see whether the liberal import reduced the need (market incentive) to develop the firms' internal technological capabilities and increased their technological dependence. Alternatively, what efforts were made by them towards building up their in-

ternal technological capability through in-house R and D? In order to pose the question in a comparative framework, we should also know what R and D efforts did the firms make during the protectionist policy regime and why did not those efforts enable them to become technologically dynamic to achieve higher output growth? An exploration into these questions is the core of this paper

IMPORT OF TECHNOLOGY AND INDIGENOUS R AND D

We begin the empirical analysis with some general comments on the recent trends in the import of technology (foreign collaborations) and internal research and development of the Indian private sector industry. As a consequence of policy liberalisation, the country has witnessed liberal import of foreign technology during the eighties. This is reflected in the increased number of foreign collaborations including foreign capital participation in Indian industries. The number of foreign collaboration approvals between 1980-1986 averaged 702 per year as against a corresponding figure of 239 between 1965-1979 and the number of cases involving foreign equity participation were 145 and 42 respectively during the above periods. The eighties started with a sudden acceleration in the rate of foreign collaboration and significantly in the proportion of financial collaboration. In a sense, the transfer of technology from developed countries has been the significant direction of technology capability building of Indian industry under the regime of economic liberalism in the eighties.

To the extent, however, that the import of technology is increasingly taking place through mechanisms potent with foreign control, the risk of technological dependence of Indian industry is likely to be high unless the import of technology is being supplemented with internal R and D effort for adaptive changes (mastering the manufacturing capability) as well as innovations to develop new processes and products (design capability). This leads us to examine the trend in indigenous innovative efforts measured by the expenditure on internal R and D during the eighties.

At the outset, we need individual firms wise data on the expenditure incurred by the firms for the import of technology and also on their internal research and development activities in order to comment upon the relationship between the two and thus, on the trends in the attitude of Indian industry towards acquiring technological capability. The relevant data available for the eighties being scanty a rigorous analysis is difficult at this juncture.

Nevertheless, certain unhealthy tendencies under the liberalised policy regime can be discerned from the data on R and D in industry being published by the department of scientific and industrial research, ministry of science and technology, New Delhi.

Particular mention may be made of the tendency towards stagnation in the R and D efforts of the private sector in general. This is indicated by the fact that R and D expenditure as a percentage of sales turnover of firms in the private sector as a whole has declined on an average from 0.78 per annum during the period 1975-76 to 1979-80 to 0.68 in the period 1980-81 to 1986-87 (see Table 1a). Yet another way of illustrating the point is to examine the growth trends in expenditure on in-house R and D. Here again, it is seen that the growth rate recorded in the private sector is lower than the one in the public sector and more significantly, it is lower during the eighties as compared to the seventies (see Table 1b).

Some ideas of the trends in the relationship between domestic R and D efforts and the import of technology can be formed from the Reserve Bank of India survey data on finances of non-financial, non-government public limited companies for different years. The data for the years since 1983-84 provide information on the combined expenditure on (RDE) and also on expenditure in foreign currencies on account of dividend, royalty, technical fees, etc (which we call here, technology-import expenditure (TME)) incurred directly in connection with foreign collaboration arrangement by the companies covered in the sample study. The relevant data for three broad manufacturing sectors as classified by Reserve Bank study (viz, (I) food, textiles, tobacco, leather and products thereof, (II) metals, chemicals and products thereof, and (III) manufacture not elsewhere classified) are presented in Table 2.

It is seen that the combined expenditure of the companies (which can be taken as proxy for the private manufacturing sector) on the import of technology is greater than the corresponding expenditure on internal research and development both in absolute amount and in relation to the sales turnover in each of the manufacturing sector considered. For the five year period as a whole, the annual direct expenditure on the technology import worked out to be 0.547 per cent, 0.71 per cent and 0.70 per cent of the total as against corresponding R and D expenditure figures of 0.06 per cent, 0.19 per cent and 0.12 per cent in sector I (food, tobacco, textiles, etc), sector II (metals and chemicals) and sector III (manufacturing, nec.) respectively.

From the perspective of building up the technological capability of the industrial sector with reduced degree of external dependence over time, it is necessary that the firms constituting the particular industries should allocate proportionately more expenditure on internal research and development (RDE) relative to the expenditure on technology import (TME) over time. In order that the relationship between RDE and TME should be complementary in any given industrial sector, the elasticity of expenditure on R and D with respect to technology

import should be positive in sign and significantly not less than unity in value. That is to say, the rate of increase in expenditure on R and D should be greater than on the import of technology over time. To put in a statistically testable form, if RDE is postulated as a linear function of TME, i.e.,

$$\log RDE = a + b \log TME + e$$

the 'b' coefficient should not be negative in sign and not less than unity in value, when that industry can said to be building up its technological capability with lesser degree of external dependence through a process of complementarity between domestic research and development activity and technology-import.

When the RBI data on the finances of non financial and non-government companies were put to the above statistical test by pooling the data for five years for the three broad manufacturing sectors the following log linear relationships were obtained:

$$RDE = -1.3131 + 0.8361 TME \quad R^2 0.7464$$

$$(-2.2560)^* (6.1850)^*$$

$$RDE/N = 2.5518 + 0.7108 IMF/N$$

$$(-5.6466)^* (3.0300)^*$$

$$R^2 0.41258$$

where, RDE/N per firm R and D expenditure and

TME/N per firm expenditure on technology import

Although the above regression analysis is carried out with the data on the combined expenditure of the firms including those which did not either undertake R and D or did not incur expenditure on import of technology, it is amenable to draw an inference of a general nature that expenditure on internal research and development activities increased with increasing expenditure on the import of technology but less than proportionately in the private manufacturing sector during the eighties. That is to say Indian industry was found backing up its import of technology with internal research and development but not adequately enough to reduce its external dependence. In other words, the relationship between R and D

and technology-import was complementary in nature but tended to be "rather limited" and weak in magnitude during the eighties.

The foregoing pieces of evidence gathered from different sources of data, viz, the data on R and D expenditure of the firms in Indian industry compiled by the ministry of science and technology and on the finance of non-financial non-government companies

surveyed by the Reserve Bank of India, illustrate the general tendency for internal R and D efforts to remain less dynamic as compared to the import of technology in Indian industry with the result that the process of technological capability-building tend to be biased towards external dependence under economic liberalism

DIRECTION OF TECHNOLOGICAL CAPABILITY BUILDING: A CASE STUDY OF ELECTRONICS

A more direct method of determining the direction of technological capability building requires analysis of individual firm wise data on expenditure on in plant R and D relative to import of technology by the firms during the eighties. In the absence of relevant data on technology payments by the firms who also undertake internal research and development activities, we can not attempt such an analysis. As an alternative, we may adopt the following method of firm wise analysis. We ask whether the annual R and D expenditure incurred by technology importers in a given industry is higher than non importers in a sample of firms undertaking R and D during the eighties. Since the R and D intensity is generally hypothesised to vary with the size of firms, we also examine the influence of the firm size on R and D expenditure. These propositions are empirically tested by using

a multiple regression equation of the following type

$$\log RD = a + b_1 TM + b_2 \log SV$$

where, RD is the level of R and D expenditure, TM is a dummy variable taking values 0 and 1 respectively for firms that are non importers and importers of technology and SV is the value of sales used here as a measure of the size

In applying the statistical model outlined above we need information on R and D expenditure of firms in the industrial sector. The department of science and technology (DISTR) surveys the firms registered with it and publishes a *Compendium of In-House R and D Centres*, which gives information on sales turnover, foreign collaboration, R and D expenditure, etc. of the firms. On the basis of above information it is possible to separate out technology importers and non importers undertaking R and D, and carry out the empirical test outlined above. As the test on the data of the firms within a particular industry gives a more stable behavioural pattern than the one across industries, we limit our analysis to one industry, viz, electronics

The choice of electronics industry is guided by the considerations that (1) it has witnessed fast changing technological advances in the world of technology in the recent years, (2) it is the key to modernisation of the industrial sector, (3) it is a 'new' industry developed on modern lines in India in the seventies, (4) its dependence on import of technology was minimal in the seventies but increased at a rate faster than for the total industrial sector during the eighties, and (5) its growth in India was rather slow earlier under the inward looking strategy and now is fast under economic liberalisation.

We collected the required data relating to electronics industry for three years (1985-86, 1986-87 and 1987-88) of the eighties from the DISTR's *Compendium of In-house R and D*. The sample covered in each year being not identical the statistical testing was carried out for each year separately. The sample firms were classified into two groups, viz non importers of technology and importers of technology. The value of sales turnover was taken as a proxy variable for the size of the firms. The results of the multiple regression show the estimates of the coefficients (Table 3)

Two interesting findings emerge from the statistical testing on the data from electronics industry though the explanatory power of the model is not high. First, the coefficient of S (proxy for size) is positive and significant but less than unity. This would imply that the increase in R and D intensity is in direct relation, but not proportionate to the size of the firms. In other words larger firms do not undertake proportionately more R and D than smaller ones. Second the coefficient of dummy variable has positive sign but is not significantly greater than zero. In other words,

CUSTOMS OF THE WORLD

A Popular Account of the
Manners, Rites and
Ceremonies of Men and
Women in all Countries

Edited by
Walter Hutchinson
Introduction to the Reprint
Edition by
L.P. Vidyarthi

Rs. 2000
(per set of 2 Vols)

The two volumes run into 1209 pages, liberally interspersed with 31 full sized coloured and 1443 black and white illustrations together with 5 maps depict the life and culture of races and tribes, clans and communities all over the world

Volume I contains articles on the life and culture of the peoples of Melanesia, Fiji Polynesia (including Micronesia) Australia Borneo Siam Burma the Andaman and Nicobar Islands, the Malay Peninsula French Indo-China, China and Mongolia, Formosa, Korea, Japan, Ceylon, Southern India, the Forest and Menial Tribes of Northern India, Bengal, Bihar and Orissa, Tibet, and Afghanistan and Baluchistan

Volume II covers the people of Turkestan, Asia Minor Palestine and Syria, Persia, the Philippine Islands, the Dutch East India, Egypt, the Southern Sudan, the Congo, Sierra Leone, West Africa, North Africa, East Africa, South Africa, Madagascar, Somaliland, Abyssinia, Arctic America, Mexico, the West Indies, North America, South America, Spain and Portugal, Italy, Holland and Belgium, Great Britain and Ireland, Germany, Austria, Hungary, Switzerland, Scandinavia, Finland, Lapland, Russia, the Balkan Peninsula and Greece

In an age, where manners and customs are fast undergoing a transformation and where distinctive cultural identities are disappearing due to scientific and technological advances, these volumes will be a permanent record of the past as it was

Lopsided Growth

Political Economy of Indian Development

by **Pradhan H Prasad**

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles heel of Indian development plans, the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

The Retarded Economies

**Foreign Domination and Class Relations in India
and Other Emerging Nations**

by **Nirmal Kumar Chandra**

Why is it that while the former colonies and semi-colonies have emerged as a major force in world politics over the last four decades, their economies in most cases remain retarded? The first part of this volume focuses on the exchanges between the poor and the rich nations. Did western aid, private capital and technology really help India, or was it the other way round? Granting that both sides made some gains, did the USSR derive undue advantage through its bilateral trade and aid transactions with the third world? Can the theory of unequal exchange explain the growing economic hiatus between the north and the south? The second part of the book is concerned with the domestic scenario in India. The author tries to relate the overall stagnation in material production per capita to the balance of class forces that emerged after independence as a result of a strategy of industrialisation based on import substitution. Long term trends in aggregate and sectoral outputs, the terms of trade between industry and agriculture, real wages and unemployment rates, savings and investment, private monopoly capital, etc, are analysed in this context. Further, the existing laws and regulations on private sector monopolies are also examined from the same perspective. The final essay is a critique of the recent tilt, inspired by the IMF and the World Bank, towards liberalism in India's economic policies.

Centre-State Budgetary Transfers

Edited by **I S Gulati**

The papers brought together in this volume examine the federal financial relationship in India as reflected in transactions through the budgets of the Union and State governments. Under the Constitution, the Finance Commission, appointed by the President every five years, is expected to recommend adjustments in inter federal transfer of budgetary funds to meet the changing requirements of the system. In fact the transfer of resources from the Centre to the States has taken forms which have fallen largely outside the ambit of the Finance Commission and it is the Planning Commission which has come to play a very major role in the determination of Centre-State financial transfers. The involvement of the Planning Commission has not, however, resulted in a more total view being taken either of financial devolution from the Centre to the States or of inter-state distribution of the amounts so devolved. While transfers under the aegis of the Finance Commission, the so-called statutory transfers, have aimed at covering the non-plan revenue account gaps of the States, the plan transfers coming under the purview of the Planning Commission have sought to plug gaps in the States' resources for financing their plans. The gap-filling approach thus continues to dominate Centre-State financial transfers. If Centre-State financial relations are to be made more equitable and are to have greater regard for efficiency in budgeting, it is argued, existing institutional arrangements will have to be substantially modified. This volume seeks to contribute to raising and debating the relevant questions.

OXFORD UNIVERSITY PRESS

Bombay Delhi Calcutta Madras

the annual R and D expenditure incurred by technology-importers is not significantly higher than non-technology importers. That the regression coefficients showed a consistent pattern with respect to the sign and the statistical significance level in all the three years suggests that an inference can be drawn with some confidence from the test results. We may interpret that economic liberalism has not encouraged the firms to strengthen their technological capability through a process of internal R and D activity in Indian electronics industry. Perhaps, the incentive structure of the market under economic liberalism is biased in favour of importing technology continuously for maximising the short-run gains rather than developing internal technological capability in the long run. If the experience of electronics industry in the eighties is any indication, the pattern of technology behaviour of the firms under economic liberalism has the potential danger of rendering Indian industry externally more dependent on, and internally less dynamic in, technological progress.

TECHNOLOGY BEHAVIOUR OF FIRMS UNDER PROTECTIVE POLICY REGIME

Let us now outline the R and D behaviour of Indian firms as revealed by earlier studies when industrialisation in the country was being guided under the regime of planning and protectionism. An earlier study analysing the relationship between the expenditure on technology import with the expenditure on in-house R and D for the period 1964-65 to 1980-81 *inter alia* suggested that Indian firms generally backed up technology import with in-house R and D efforts. That is to say the relationship between internal R and D activities and technology import was one of complementarity. Further, it was also shown that the elasticity of expenditure on R and D with respect to technology import was found not significantly less than unity during that period. That is to say, the firms importing technology backed it up with internal R and D activities for building up their technological capability with reduced degree of external dependence during the regime of protectionism. Studies by some other scholars⁸ have also found that expenditures on R and D were positively related to payments for imported technology in specific industries studied and also for the manufacturing sector as a whole during the periods of their studies. The evidence of empirical studies for the period during the seventies thus tends to suggest that the firms' technology behaviour in the compulsive environment of controls under the regime of planning was one of raising relative expenditure on R and D for innovations, perhaps marginal and adaptive in nature, as compared to the expenditure on technology import on a continuous basis.

In the compulsive environment of controls R and D efforts were, however, mostly confined to down scaling the process knowhow

to suit the domestic market, to carry out detailed engineering, to substitute imported inputs by local materials, etc. These efforts did help to improve the technological capability for manufacturing the products to the given designs and specifications with economy in foreign exchange cost, but there were limited progress in developing improved/new designs or processes keeping pace with the cost-effective and high productive technological changes taking place in the international market. In a sense, then one could say that the strengthening of technological capability in Indian industry was constrained by the protectionist policy in the planning regime. For, there were not an incentive structure of the market required for stimulating cost effective and productivity-raising technological changes.

Did the incentive structure of the market under economic liberalism in the eighties induce the firms to change their strategy and improve upon their technological capability and productivity performance through increased in-house R and D efforts? The results of our statistical analysis of the general data for the private manufacturing sector as a whole and the firm wise data in respect of Indian electronics industry attempted in this paper do not lend support to a positive answer. Contrarily, the liberal import of technology during the eighties seems to have reduced the need (or incentive) for internal R and D efforts and rendered them rely upon the technology import on a continuous basis for meeting their technological needs. The effect of economic liberalism is not seemingly in the direction of stimulating internal research and development activities for raising the technological capability-building with reduced external dependence, it is in the direction of raising the firms' technological level for manufacturing with increasing external technological dependence.

CONCLUSIONS

To summarise, the pattern of technology behaviour of Indian firms during liberalisation in the eighties as compared to the earlier period of protectionism leaves some lessons for the future industry technology policy. The stress on protectionism and regulation may provide a compulsive environment that makes the firms supplement the import of technology with internal R and D efforts and strengthen the *manufacturing capability* but the lack of competitive environment makes them indifferent to develop the *design*

capability in tune with changes in the world technology with the result that the benefit of higher productivity and output growth would not be significant. On the other hand, the incentive structure of market under economic liberalism may be biased towards distorting the technology behaviour of the firms in the direction of indifferent internal learning (R and D efforts) but may raise the firms' technological level on the basis of continued dependence on technology import and attain higher levels of productivity and output growth.

To conclude, both the policy regimes (regulatory planning as well as economic liberalism) could strengthen the technological capability, though of different types. Therefore, the apparent dichotomy between 'protection' and 'competition' must be viewed as a false dilemma and the policy objective should be to get a desirable mix of market and planning modes in relation to technological change in Indian context. What is perhaps needed is a relatively free environment of the market for technology-import but accompanied by positive intervention of the state to ensure that the import is backed up with domestic R and D efforts for the firms industry to move along a 'dependence-independence' continuum of technological change. As for the future policy, therefore, there is a logic in further freeing the Indian industry from unnecessary bureaucratic shackles *inter alia* in relation to import of foreign capital and technology and yet, there is the need for socially purposeful and effective state intervention to strengthen internal technological capability and promote the industrialisation with a greater degree of autonomy.

MAHARASHTRA'S NEW LOTTERY

On Every First Friday From September 6, 1991

MAHARASHTRA LAXMI

Common Prize For All Three Series

Rs. 5 LAKH

Also other prizes as mentioned below

3 prizes of Rs 51,000

3 prizes of Rs 21,000

9 prizes of Rs 11,000

180 prizes of Rs 1,000

1,800 prizes of Rs 100

18,000 prizes of Rs 15

and

180,000 prizes of Rs. 7

Price of Ticket Rs. 3 only.

For Maharashtra's Economic and All Round Development

MAHARASHTRA STATE LOTTERY

Do State Level Public Enterprises Need Memorandum of Understanding?

T L Sankar
R K Mishra
R Nandagopal

This paper examines the rationale for the introduction of the memorandum of understanding in state level public enterprises, the pre-conditions for its initiation, the institutional set-up required for the preparation and implementation of the MOU and the broad structure of what the MOU should contain for the negotiating parties.

Recommendations for the successful installation of the MOU as a business system have also been incorporated

THE memorandum of understanding (MOU) is the most widely talked about reform in the sphere of public enterprises (PEs). There is a great deal of agreement in the policy making academic research and managerial spheres on the relevance of this instrument to improve the performance of PEs through revamping the government—PE interface. This seems to be the underlying force behind the present move by the department of public enterprise (DPE) government of India, to sign MOUs with 140 of its enterprises.

The state level public enterprises (SLPEs) are a major component of the PE system in India. These enterprises employ about 40 per cent of the total capital invested in the PE system. In terms of numbers SLPEs are more than three times the central PEs (CPEs). Their operational profiles are more variegated as compared to the CPEs. Their performance measured in terms of bottom line results has been far below that of their counterparts in the central sector. Against this backdrop, it is not presumptuous to ask whether the SLPEs should take recourse to the MOU.

NEED FOR MOU IN SLPEs

There are many reasons justifying the introduction of the MOU in the SLPEs. As noted earlier, the financial performance of the SLPEs poses a great threat to the resource mobilisation efforts of the nation. During the Seventh Plan period on an investment of Rs 45,000 crore these enterprises were expected to earn a marginal profit. Instead of meeting this insignificant target, these enterprises incurred colossal losses. The performance of the SLPEs unlike the CPEs, is dismal in all categories. To cite an illustration, whereas the enterprises in the oil sector at the central level are distinctly known as high money makers, there is no such class of enterprises among the SLPEs. The studies completed by the Institute of Public Enterprise for the Ninth Finance Commission and the Planning Commission show that the SLPEs divided into five categories viz, manufacturing SLPEs, trading and service SLPEs, financial SLPEs, promotional and development SLPEs and welfare SLPEs, were all characterised by negative profitability at the net margin levels. Whereas 57 of the 230 CPEs incurred cash

losses in 1988-89 about 300 out of the 754 SLPEs had suffered cash losses in 1986-87. The financial statements of the CPEs for 1988-89 reveal an accumulated loss of about Rs 10,000 crore against reserves and surpluses of about Rs 12,000 crore indicating that the accretion in the net worth was almost conspicuous by its absence. However, the scene was much more dreary in the case of the SLPEs. The figures for the 25 states of the country show that in 1986-87 there was an erosion in the net worth of the SLPEs ranging from 4 per cent in Goa, 70 per cent in Karnataka to 231 per cent in Rajasthan and 345 per cent in Nagaland. This erosion was 42 per cent in the SLPEs of Andhra Pradesh, 47 per cent in the SLPEs of Assam, 68 per cent in the SLPEs of Bihar, and 34 per cent in the SLPEs of Kerala.

The government PE interface assumes a much more complicated dimension in the case of the SLPEs as compared to their counterparts in the central sector. Though theoretically there is to be arms length relationship in the case of these enterprises with the state governments, it is not observed in practice in view of the fact that the permanent secretaries of the departments controlling them have easy access to these enterprises. Further they stand on a higher ground vis-à-vis their chief executives on account of substandard recruitment and lack of competence of such managers. The frequent arm twisting by the secretaries to government either on their own or on the behalf of ministers has vitiated the working of these enterprises to their detriment.

The lack of clarity of both the macro and micro objectives has afflicted these enterprises more than the CPEs. In the case of the latter there have been at least sporadic attempts to formulate the macro and micro objectives. The central government as the owner of the CPEs has been trying to have a close look at their macro and micro objectives through the formulation of the White Paper. Excepting Andhra Pradesh, no other state in the country has made any such attempt in this direction. In the absence of role clarity, these units have turned out to be more 'public' than 'enterprise'. The SLPEs have been explaining away their low performance by referring to the fulfilment of the social objectives which has cut ice neither with policy makers nor with researchers. The three dimensional classification of the CPEs

in terms of public purpose, profit earning and resource mobilisation would show that out of 250 enterprises, only 30 enterprises secure 'high' on all the three dimensions. As opposed to this, a study conducted by the Institute of Public Enterprise (IPE) for the inter state council of the government of India indicates that about 100 of the 754 SLPEs score high on all the three dimensions. It is interesting to note that the enterprises scoring high on social purpose number only 75 in the case of CPEs in contrast to a tall figure of 500 in the case of the SLPEs.

Performance targeting has behavioural implications not only for the CPEs but also for the SLPEs, as without well defined targets most of them sail aimlessly like rudderless ships. It is not fair to comment upon the quality of the managerial personnel in the SLPEs as compared to their counterparts in the central sector. The recent training and career prospects are more well defined for executives of the CPEs as compared to the SLPEs. The chief executives of CPEs have a longer tenure than their counterparts in the SLPEs. Performance targeting would hand down to these personnel in the SLPEs the requisite guideposts in terms of which their success would be measured.

One of the problems of the PEs in India is information overload. Information is generated whether required or unrequired. Many systems have been installed without giving due thought to their end use and networking. The introduction of the MOU would provide an opportunity to the SLPEs to reappraise the need for such control systems and retain only those which have not outlived their importance and fit in well as a part of the new performance evaluation system.

SPECIAL FEATURES OF SLPEs

The SLPEs are a mass of heterogeneous organisations dealing with diverse activities in a volatile environment. They have more principals than the CPEs. They are executive arms for implementing state policies e.g., civil supplies and price support operations. They also provide more crucial inputs, e.g., electricity and road transport.

The first and foremost condition for installing the MOU in the SLPEs is their division into dominant categories as governed

by socio-economic objectives. We have already suggested our scheme for such categorisation in the form of manufacturing, trading and service, financial, promotional and development, and welfare enterprises. This has not been done in the case of the CPEs and as a result the MOU has lacked effectiveness in that context in that it has failed to capture the socio-economic nature of these enterprises which has weakened the negotiating process. Such a classification of the SLPEs would make the MOU a genuine instrument of performance evaluation in that it would enable managerial performance to be judged with much greater comprehension in the wake of social objectives being fulfilled by these units.

The initiative for formulating the MOU would have to rest with the administrative ministry/responsible authority in the case of the SLPEs for these enterprises operate in highly sensitive areas as they affect the public interest directly. For instance, the road transport corporations, state electricity boards, scheduled castes welfare corporations, scheduled tribes welfare corporations, state housing boards, state minorities development corporations, corporations for the development of handicapped, women development corporations, civil supplies corporations, essential commodities corporations, state warehousing corporations, state industrial development corporations, state small-scale development corporations, state industrial infrastructure corporations and state financial corporations are public instruments in the hands of the state governments. The extent of their activities, their spatial spread, delivery costs and staffing could not be decided by the executives in the SLPEs. Targets must be sensitised to public needs.

The parties pooling their heads to formulate the MOUs would include not only the administrative ministry and its enterprises but also the workforce. The management by objectives (MBO), though a laudable concept could not take roots in the public and private sector enterprises in India as it did not traverse from top down to bottom. In the case of the SLPEs in order to make the MOU philosophy acceptable by one and all, it would be necessary that the whole lot of workers are involved in the process of its formulation as well as implementation and review. There is no denying the fact that the labour problems in these enterprises have posed substantial danger to profits and productivity.

The negotiating process would have to be all inclusive. The MOU should not turn out to be the prerogative of the administrative ministry and the enterprise but should become an instrument for the turn-around by providing for the coming together of the suppliers, foreign collaborators, directors, consumers, financiers, etc., in the common cause of performance improvements in the enterprises under discussion.

The MOU as an instrument of improv-

ing the SLPE performance should have stress on improving the autonomy, on the one hand, and accountability, on the other, of these enterprises. It needs to be understood in very clear-cut terms that the autonomy they could secure through this instrument would be more in the nature of operational autonomy and not strategic one. However, to decide as to the extent of strategic operational autonomy mix, the SLPEs need to be divided between competitive and non-competitive enterprises. If these enterprises are in core sectors, the performance improvement would come through the liberalisation of operational autonomy. In the case of enterprises in the competitive sectors, the performance improvement would have to come through the liberalisation of the strategic autonomy. In fact, carrying this argument to its logical conclusion one could strongly assert that there is no need to control the enterprises in the competitive sectors. Such enterprises could be distanced from the state government and for their survival they should make proactive or reactive decisions as warranted by the market forces.

Finally, the MOU to give desired results would have to have a strong edifice present in the form of well formulated corporate plans supported by detailed action plans. The corporate plans and the action plans should express in detail the environment, strengths and weaknesses, and strategies. This is important because of very short tenures of their chief executives. In fact, action plans could succeed as long as they take off from the comprehensive corporate plans and form a part of a well drawn out MOU, supported in letter and spirit by the state government. It is worth cautioning here that all efforts should be made to avoid the features responsible for the lack of enthusiasm faced in the implementation of the MOU signed by the CPEs which have been characterised by too many provisions pertaining to review. This possibly could be eliminated by bringing into the picture the various administrative ministries and authorities who could exert their impact on the attainment of goals by these enterprises.

ORGANISATIONAL FRAMEWORK

It is a moot point to consider as to what sort of institutional structure should be created to oversee the implementation of the MOU and its review in the case of the SLPEs. We are of the view that one of the reasons responsible for the lacklustre performance of the MOU in the CPEs at least in terms of its philosophy, has been the inappropriate organisational framework. In the case of the CPEs the High Power Committee at the top is assisted by the inter-ministry Standing Committee and *ad hoc* task force in conceptualising, okaying and reviewing the MOU. The MOU monitoring cell in the department of PEs is responsible for the operationalisation of the MOU. It

is a nodal point in the department of PEs constituted for co-ordinating activities relating to the design, drafting, finalisation, monitoring and evaluation of the MOU. The cell acts as the secretariat to the High Power Committee and services the *ad hoc* task force. The High Power Committee is chaired by the cabinet secretary and it consists of those secretaries who do not sign MOU themselves. It has been set up to evaluate the performance of CPEs and their concerned department in fair, objective and unbiased manner. The Inter Ministry Standing Committee has been set up under the chairmanship of the secretary, department of public enterprises. This committee monitors and evaluates the MOU at the first stage for the consideration of the High Power Committee and maintains a continuous link between these ministries.

The review of the organisational framework for the MOU at the centre would clearly point out that an extensive body of institutions has been created without putting the real nerve centre into it. Any system of performance evaluation must be based on proper information flow, proper performance evaluation technique and suitable performance incentive plans. For the MOU to operate as an effective performance evaluation system the powers that matter in corridors of the government must be brought into the process of negotiation with the PEs. This is because the MOU as a performance evaluation system is different from the return on investment technique which is primarily static as opposed to the MOU which acts as signalling instrument giving enough opportunity to the negotiating parties to stop the birth of forces leading to performance deterioration.

It is therefore in the fitness of things to suggest a four tier organisation for the formulation and implementation of the MOU in the case of SLPEs. In this scheme of things at the top would be the Performance Evaluation Council (PEC) serviced by PE Management Board/Bureau of Public Enterprise which, in turn, would be advised by the performance evaluation task force. Operationalisation of the MOUs could be left to an independent/autonomous body. PEC would be the apex performance evaluation organisation. It should be in charge of the deliberations and resolution of matters related to the performance of the SLPEs. It could comprise the minister of industries, minister of finance, and the other ministries in charge of the corresponding SLPEs. This council should formulate the general guidelines for the draft preparation of the MOU, co-ordinate the budget preparation of the SLPEs and evaluate the managerial performance of these enterprises. This council should formulate the performance evaluation criteria, compute target variance, decide the incentive bonus rates for the SLPEs as a function of performance evaluation results and may suggest the dismissal of PE chiefs for poor management. The PE management board/BPE should work as a

secretariat to the PEC and report directly to its chairman on the preparatory work and follow up action of the PEC, such as selection of the performance evaluation task force members and assignment of specific jobs to each task force member should be handled by this body. This organisation should liaise with the ministries handling the SLPEs.

The performance evaluation task force should render preparational and technical help connected with the performance evaluation system. The major assignment of this body should be drawing up the performance evaluation manual and management guidelines and the evaluation of the management performance according to the evaluation criteria of the manual. This task force should draw 75 per cent of the members in the respective states from its pool of management experts, accountants, legal experts, retired civil servants and policy analysts. The remaining 25 per cent of the members should be drawn from these categories from other states of the country.

To operationalise the MOU, the responsibility for installing the operating systems including charting out the information flow and providing information could be entrusted to autonomous agencies such as the Institute of Public Enterprise. Such an institute would work as a public enterprise research unit responsible for developing the appropriate performance evaluation system, obtaining relevant information, processing it for the requisite analysis and advise the PE management board and the task force on various issues concerning performance evaluation. To make things work effectively and to add elements of transparency, it would be advisable that in each state an enactment is passed on the performance evaluation system for the SLPEs therein. This would help the citizens know what is happening in their enterprises and would keep these enterprises under the self-imposed pressure to perform and thereby help them in ironing out forces corroding their autonomy.

MOU EVALUATION CRITERIA

The SLPEs scene is vastly different from the CPEs and if this fact is not understood well, one would be only mistaking the trees for woods. The division of efficiency indicators such as static and dynamic would be of little avail. The combined balance sheet and profit and loss account of the SLPEs available with the Institute of Public Enterprise shows that for Rs 30,000 crore capital employed, the goods and services sold amounted to a bare Rs 12,000 crore in 1986-87. The materials cost exceeded 50 per cent of the total cost. The selling and administrative costs amounted to 30 per cent of the total cost. The project management was in doldrums. The capital works in progress were more than Rs 10,000 crore. Practically, no attempt was made by these enter-

prises to create new business, diversify their activities or multiply the present activities. In such a scenario the evaluation criteria for the SLPEs would include parameters such as the increase in business, reduction in costs, reduction/stabilisation of assets, increase in man-hours of work, higher capacity utilisation, optimisation of the cost of capital improvement in the production technology, improvement of quality control, export of goods, import substitution, quality of project management, mobilisation of internal resources, reduction in the budgetary outlays from the state, introduction of workers' joint management/workers' participation in management at the board level, industrial safety, reduction in the rate of turnover and workers awards bagged by the employees etc. The five-point scale adopted by the CPEs could hold good in the case of SLPEs too. The criterion values or rules that distinguish various performance could differ from enterprise to enterprise keeping in view their nature.

The MOU in the case of SLPEs must be a value added exercise in that they would be entering the fray only after a reasonable experience gained by the CPEs. A suggestion worth considering here could be whether the period for which the MOU is

negotiated may be more than one year or not. The MOU should be part of the long-term performance evaluation exercise covering a period of five years. Such an arrangement would give a reasonable time for the fair trial of the MOU as an innovative concept. It would give an opportunity to the PEC and the associated institutions to suitably alter the conditions and correct their mistakes. The SLPEs would equally benefit by the longer span as they would have adequate time to overcome the lapses and reverses. The fate of some MOUs in CPEs in the name of externalities would not get repeated in the case of the SLPEs. If the duration of the MOU could be five years, then the pluses and minuses on the score of externalities would possibly get neutralised between one period and another.

To sum up, the SLPEs have attracted sharp criticism from different quarters on account of their sub-optimal performance. The MOU as a performance evaluation system raises new hopes of improving their performance levels. While the introduction of the MOU would give a shot in the arm of these enterprises, due care should be exercised in its introduction and application in view of the special features such enterprises possess.

AMERICAN EXPRESS BANK LIMITED

(INCORPORATED IN U.S.A. WITH LIMITED LIABILITY)

NOTES TO ACCOUNTS

1. PRINCIPAL ACCOUNTS POLICIES

a) GENERAL

The accompanying financial statements have been prepared according to the historical cost convention and conform to generally accepted accounting principles and to the practices prevailing within the banking industry.

b) FOREIGN CURRENCY TRANSLATION

- Assets and liabilities in foreign currencies except deposits from Non Residents in FCNR accounts are translated into Indian Rupees at the rates notified by FEDAI as at the balance sheet date. Resultant gains or losses are taken to the profit and loss account. Transactions during the year are translated into Indian Rupees at the rate current at the date of the transactions. The FCNR account balances are valued at the rates specified by the Reserve Bank of India from time to time.
- Contingent liabilities in respect of Forward Exchange Contracts are included at contracted rates.
- Outstanding Forward Exchange Contracts are revalued at the rates notified by FEDAI as at the balance sheet date in order to account for the financial effect thereof.

c) INVESTMENTS

The bank values all investments it intends to hold at cost after amortisation of discount or accretion of premium from the date of purchase to the maturity of the investments. Investments held for trading purposes are valued at market values. Resultant gains or losses are taken to the profit and loss account.

d) FIXED ASSETS

Depreciation is on the written down value method at the rates specified in the Income Tax Act, 1961 except for computers which are depreciated at the rate specified in Schedule XIV of the Companies Act, 1956.

e) ADVANCES

Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of identified advances based on a periodic review of advances and after taking into account the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit and Guarantee Corporation and similar statutory bodies.

f) INCOME RECOGNITION

Interest income is recognised on an accrual basis. However, in the case of non performing advances it is taken to the profit and loss statement on collection.

g) STAFF BENEFITS

Provisions for gratuity and pension benefits to staff have been fully made on the basis of actuarial assessments.

h) NET PROFIT

- The net profit disclosed in the profit and loss account is after
- the effect of revaluation of trading investments (see paragraph (c) above);
 - provisions for doubtful advances (see paragraph (e) above);
 - other usual and necessary provisions.

i) TRAVEL RELATED SERVICES

In accordance with the instructions received from the Reserve Bank of India, the assets and liabilities related to and appearing in the books of the Travel Related Services Division after adjusting the profit/loss for the year have been shown under Other Assets and Other Liabilities.

j) Remuneration paid to the Chief Executive Officer was as under

| | 31/3/1991 | 31/3/1990 |
|---|-----------|-----------|
| Salary | Rupees | Rupees |
| Allowances | 112 000 | 112 000 |

AUDITORS' REPORT ON THE ACCOUNTS OF THE INDIAN BRANCHES OF AMERICAN EXPRESS BANK LIMITED UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have examined the Balance Sheet of the Indian Branches of American Express Bank Limited (Incorporated in U.S.A. with Limited Liability) as at 31st March 1991 and the related Profit and Loss Account for the year then ended in which are incorporated the transactions of the Office of the Chief Executive Officer and the transactions of Travel Related Services Division in India

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of Sub Section (1) (2) and (5) of Section 211 and Sub Section (5) of Section 22 of the Companies Act 1956 the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956. The accounts are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act 1949

We report that read with the foregoing remark

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory

(b) The transactions which have come to our notice have been in our opinion within the powers of the Bank

(c) In our opinion proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books

(d) The Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account

(e) In our opinion and to the best of our information and according to the explanations given to us the said accounts read with notes thereon give the information required by the Companies Act 1956 in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as at 31st March 1991 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branches for the year then ended

Understanding Labour-Management Relations

Case of Siemens

Radha Iyer

A large corporation has been described as a state within a state. Within the organisation state certain production processes give rise to definite relations of production. With changes in the production processes, the relations of production must also change. However, while changes in production processes are harbingers of organisational change, the relationships are reinforcers of status quo. This is the key to understanding modern day industrial relations issues.

This article reviews and analyses the labour struggles in Siemens and the management's response to them and its perspective on industrial relations.

I

In the end personnel men, like everyone else in the technostucture are powerless in the face of the inevitabilities of the organisation. Consequently manipulative methods enter into almost all aspects of personnel work in the giant corporation. This is the second feature that distinguishes personnel work in the mature corporation and it is a difference of kind, not of degree.—Graham Bannock in *The Juggernauts*

—The Age of the Big Corporation

THE workings of large modern corporations have from time to time agitated the minds of economists and writers ever since they came on to the social scene as one of the indelible features of modern society. While earlier concerns centred around the emergence of large corporations and the changing concepts of private property. Later concerns centred around ethical questions relating to monopolistic oligarchies *vis à vis* *laissez faire*, the relationship of modern technology to large scale production and issues like advertising ethics and the role of large corporations. Later still the concerns shifted to the deleterious effects of large corporations on the individuality of man and their emotional social and psychological impact on those who worked in the corporations—the 'organisational man'. More recent concerns have centred around the role of large corporations on vital social issues such as consumerism and environment. Very little has been said on the functioning of large corporations and their ramifications for the wider labour movement and working class consciousness. Discussions on industrial relations speak of the management and union as though management is one homogeneous entity—akin to the employer of yesteryears—in fact 'management' and 'employer' are often used as interchangeable terms. Interestingly when speaking of the union however, a definite differentiation is made between workers and leaders. This is largely due to the myth of the 'corporate person' or the corporate body as a juristic 'person'—akin to the natural 'person'. This myth is the foundation of modern property relations and therefore, social relations. Just as it becomes necessary for owners of capital

to lift the 'corporate veil' from time to time it becomes necessary for labour to do so for comprehending the inner nuances and evolving its own responses and strategies. Whereas the owners of capital have evolved well defined principles and codes for lifting the 'corporate veil' in certain circumstances—like mismanagement, oppression of minorities, etc., all of which are manifest in the development of corporate law—labour has done very little in this area in relation to industrial relations and union management conflicts.

This is so, because the ideological foundations of modern labour movements was principally influenced by Marxism. Later day Marxists tended to treat the 'capitalist class' as a conglomeration of individual capitalists even though the individualist capitalist had long vanished and his place had been taken by the corporate capitalist (i.e., the organisation of capital). Though Marx himself saw the logical development of commodity production and competition resulting in a system of production wherein the organisation of capital confronts the workers as independent of their labour, the managers and capitalists as independent of capital and all parties involved in the production system as a force independent of themselves (see Marx in *Capital*, Vol 3).

The emergence of the large corporation testifies to this alienation, i.e., the emergence of the social organisation of capital as a force independent of any of its components. The ramifications of this for labour movements has however not been studied or comprehended fully due to the stagnation in the development of Marxist theory itself in later years. Braverman and others laid the foundation for understanding this process with their studies on work process, but their implications for working class movement has remained unexplored.

II

In the quintessential corporate bureaucrat, two phrases are axiomatic truths: one is 'This is (or is not) management decision'. The other is 'This is (or is not) the company's culture'. Corporations today are not merely 'juristic persons' in the legalistic sense, but have a functional dyna-

mics that has a momentum of its own irrespective of the subjective will of the individuals who run the corporations. Individuals in corporations repeatedly find themselves reacting to a set of situations rather than being in control of them—or in other words 'managing them'. This self-reinforcing nature of the corporation presents itself to individual managers as an abstraction independent of themselves, i.e., as 'management' decision as against the 'manager's decision'. In the self-regenerating aspects of the corporation's functioning, it presents itself as 'the company's culture' as against a rational policy laid down by managers.

"While a small company can bend the organisation so as to get the most out of the individuals, so does the mature corporation bend its individuals to get the most out of its organisation" (Graham Bannock, *The Juggernauts—the Age of the Big Corporation*). This process of bending individuals may not always be a smooth one. Often, like any malfunctioning in the anatomy of a corporation, it triggers off shock waves that run right through the corporation. The workers who are at the bottom rungs are at the receiving end of the shock wave and act as the earthing for the organisation—transmitting the shock waves—often burning themselves up in the process. This manifests itself as conflicts between workers and officers or workers and workers—i.e., as an industrial relations crisis having wider social ramifications. Looking at industrial relations problems only from the limited angle of workers and their limited demands relating to wage service conditions, union recognition, etc., without taking into account the corporations' internal dynamics and decision making processes, leaves large grey areas in our understanding of industrial relations and conflicts. The understanding of the internal dynamics of organisational functioning and decision making is not always easy. 'The large modern corporation is so impersonal, so tightly organised, the information that emerges from it so carefully processed that these human problems hardly ever break through the glossy exterior surface of corporation harmony and efficiency' (Bannock in *The Juggernauts*).

This article attempts to trace the internal decision-making processes and forces at work leading to the present conflicts in labour management relations in Siemens. The company's lock-out affecting 534 of its 3,000 employees has prompted some serious questions. Is the lock-out because the workers have demands relating to wages, conditions of service, union rights? The answer is 'no'. When the crisis began in 1990 the company and the union had concluded a satisfactory settlement which was renewable only by mid-1991. There were no major demands that were pending. Had there been go-slow or work-to-rule violence or indiscipline? And again the answer is 'no'.

The year 1989 was one of the most productive years. Production for year ended September 1990 was excellent and targets were completed on time. Is the company reorganising itself and using the lock-out as a cover for rationalisation? Again the answer is 'no'. The company has completed one round of rationalisation and is well-poised for an expansionary phase of growth. Have there been union rivalries? Again the answer is 'no'. The workers after a prolonged period of internecine conflicts had managed to unify their ranks, rally under one union, keeping all outside leaders away. Workers had also thrown up a capable leadership amongst the workers who had actually shown considerable adeptness in handling wage negotiations and industrial relations. From 1987 to 1989 the union-management relations appeared to be at its best barring what apparently were a few irritants. In March, 1990 Siemens might have been a textbook case of ideal industrial relations. What then happened? For an answer it is necessary to 'lift the corporate veil' *vis-a-vis* the company's dealings with labour and trace the inner dynamics and the organisational imperatives that has led to this present impasse, for apparently no reason.

A combination of three factors have contributed to the present crisis and as will be seen, none of them had anything to do with the immediate demands of workers in the normal sense of the term. Firstly, and most importantly, the democratisation of the trade union and the response of the company to it. Secondly, expansion of the company, technological changes and reorganisation of the company had consequent changes in power structures within the company. Thirdly generational changes among the workers and managers. These three factors seriously affected the concrete history of industrial relations in the company. It is therefore, necessary to look at the interplay of these three factors in the context of the history of industrial relations in the company prior to 1989.

The company started manufacturing operations as a small private limited company in 1957, with a few hundred workers

at Mahalaxmi in Bombay. The first phase of expansion came around 1965. By then the company had set up a plant at Worli. The next phase of expansion came around 1970s when the company shifted its major operations to Kalwa. After the 1980s round of expansion the company is now poised for further growth into newer areas. Presently the Worli plant employs approximately 200 workers, the Kalwa plant approximately 2,600 workers and the Nasik plant approximately 300 workers.

The history of industrial relations in the company may be divided broadly into five periods—the period from 1950 to 1965, 1965 to 1972, 1972 to 1979, 1980 to 1987 and 1987 to the present. However, through the period from 1965 to 1987 two common threads ran through the fabric of industrial relations. One was the control over the workers through the creation of a well entrenched trade union bureaucracy; the second, that the company had never dealt with a union having the support of majority of the workers. Both these threads had become part of company's culture and breaking these threads involved cataclysmic changes in the establishment. Both these threads sapped only after 1987. Objectively the situation called for the creation of a new tradition and culture on the part of the company. Thus the company could not do, as its own culture had now become a fetter

EARLY UNIONISATION

Control over the union has meant for the company the creation of a well-entrenched trade union bureaucracy which will be in a position to 'run the show' i.e. control workers. This it has done by adopting various slogans at various phases. In 1959, the workers joined their first trade union, namely, the Engineering and General Employees Union, which was a general trade union whose organisational affairs transcended the company and its workers and over which the company could not hope to have any control or influence. The company therefore raised the bogey that general trade unions were all political unions, whose leadership was interested not in the welfare of workers but their own political and collateral purposes.

Ostensibly for these reasons the company refused to deal with the union. The union approached the industrial tribunals for the resolution of their demands. Those were the days when numerous tripartite forums were set up at the national level to promote industrial relations and unions were optimistic about them. An award of an industrial tribunal is operative for one year. This fact appears to have weighed with the company when it decided to sign a settlement with the union for a period of five years. The five-year settlement caused great dissatisfaction amongst the workers and the union. The workers then approached a trade union leader affiliated to CITU, who formed the Siemens Workers Union in the year 1964 with himself as general

secretary. This was an internal union. The workers believed that now the management would recognise the union. The company, however, refused to recognise the union, because apparently, the company's perception of the outside CITU leader was that he was somewhat of a maverick and would not be amenable to cooptation. The workers went on a 45-day strike in which the issue of recognition featured prominently. The strike was resolved after certain officers of the company took the initiative to promote a group of workers to break the strike. The officers who organised the strike-breaking had foresight enough to realise that breaking the strike was one thing, but leaving a vacuum in the trade union organisation was only likely to create continued disturbances. Simultaneously with breaking the strike the company arrived at an understanding with the CITU leader that a more 'responsible' person could be co-opted onto the internal union. Accordingly another CPI leader was co-opted as president of the union and the union was promptly recognised.

It would, however, be a misnomer to say that the company recognised the union as such—the company had in fact only recognised the president of the union. He alone mattered in the union, as far as the company was concerned. It was the president who took decisions and sold the decisions to the workers. In order to do that it was necessary that the union build up a hierarchy of officials and activists who were loyal to the president—and this is a singular attribute of all bureaucracies. A three-tiered hierarchy emerged in the union. At the top was the president and the general secretary; then a group of committee members who were totally loyal to the president and general secretary but were themselves not in a position to seriously challenge or threaten the position of the president and general secretary. At the bottom a small group of workers in different shops and plants who owed personal allegiance to the committee members for some reason or the other such as being obligated to them for getting their grade sanctioned or fixing a relative in employment or because they came from the same village and so on. This three-tiered structure controlled the rest of the workers. There was no internal democracy in the functioning of the union. The statutory general body meetings were held on holidays outside the company where attendance was thin, normally around 15-20 per cent of the membership and voting was by a show of hands. Dissent was outmanoeuvred either by shutting out the problem or adopting dilatory tactics as again is typical of bureaucrats.

If the union emerged as a well-structured bureaucracy the management was also a well-structured bureaucracy. The only persons who mattered as far as labour was concerned were the managing director and the chief personnel manager who corresponded to the president and general secretary of the union. The line managers, the production personnel even the works personnel management had little or

no say in the personnel policies. The corporate bureaucracy and the trade union bureaucracy dovetailed perfectly from 1964 onwards and could finally be dislodged only in 1987—at great cost to the company and the workers.

NEW WORKFORCE

All bureaucracies give rise to democratic aspirations of people. The workers of Siemens were no exception to this. Dissent and dissatisfaction with the union leadership began to grow. What gave this dissatisfaction a shape and form was directly related to what was happening to the company itself. Around the latter half of the 1960s and the early 1970s the company expanded rapidly. This meant an introduction of a large number of new workers. As the expansion introduced new and more sophisticated technology than had existed before, the new workforce was both highly skilled, educated and young. Most of the recruits were from the company's training centre which had been set up around the mid-1960s. With the expansion also came a band of young engineers straight out of engineering colleges. Both these sets of new recruits were at odds with their organisation—the workers with their union and the engineers with the company. These changes called for commensurate changes in management methods and policies. The company, however, only reacted by reinforcing *status quo*. This *status quo* was in conflict with the new objective needs of the company created due to growth.

The result was a serious industrial relation crisis. The expansion also resulted in the break down of old job classification and gradation arrangements. The challenges to the union leadership and the company therefore came by way of a number of disputes relating to grades and classifications in the early 1970s. However, neither the leaders of the company nor the union took note of the changes that had come over the company and what it meant in terms of industrial relations. Since the disputes centred around grades and classification, the immediate representative of the management on the shopfloor was the engineer who had to first of all tackle the problem and he had no say in any of the matter with the personnel management. For example, during that period, workers would come up with up to ten ways of outwitting the engineer. One common method was to work exactly according to the drawings handed over by the engineers. Everybody knows that this is hardly possible because the drawings do not incorporate every possible option available at the shopfloor for achieving the end results. To cope with this action of the workers the engineers would make alterations in designs again and again with no result. The idea was not to exercise judgment and discretion as those factors were not given weightage in the point rating for classification. After some pressure was thus built up they would exercise their judgement and discretion, complete

the job and confront the engineer with the issue of their grades. Often the engineers felt convinced that the jobs really needed to be upgraded. They would plead with the personnel department on behalf of the workers. However, they had no say in such matters. Such disputes broke out more particularly in departments like maintenance, tool rooms, R and D machine shops. A number of brilliant engineers left the company during this time as they found themselves stifled and saw no future for themselves there. Those who stayed on became resigned to their voicelessness and thus the organisation bent them to its need.

The workers took up their grievances with the leaders. The personnel managers seldom dealt with the workers directly sans their leaders. To top officials of the company and the union these issues were trivialities. They would sit across and deal with them perfunctorily without consulting the workers or the concerned engineers. The workers would be dismayed. Thus the first conflicts that arose saw the company and the union leaders arrayed on one side and the workers on the other. All this led to a mistrust of outside trade union leaders among the workers. However, for this mistrust to translate into action required some degree of self-confidence with subsequent happenings developed in the workers. Along with the mistrust the idea that the union was a workers' organisation and that workers must have a direct say in its affairs also emerged.

IV

The next major dispute related to bonus settlements. According to the Payment of Bonus Act, bonus is payable annually according to the allocable surplus for that year to be calculated according to the formula provided in the act. The company was in an expansionary and high growth phase from 1971 to 1973, reserves and surplus almost trebled, debts reduced by nearly half, and turnover nearly doubled (Annual Reports 1971 to 1973 and union handbills).

The union, however, in 1970 signed a bonus settlement for three years agreeing to a bonus of 6 per cent for the first year, 7 per cent for the next year, 9 per cent for the third year. All around several smaller companies were paying better bonuses. The company was prospering and at the end of three years barely a drubbing of it fell to the workers' share. Unlike the grades and classifications disputes which were confined only to certain sections, albeit important sections, of the establishment, the bonus disputes concerned all the workers. The issue soon became the focus of a revolt. It is reported that when confronted by the workers at a gate meeting on the bonus issue, the president of the union said: "We are but workers—we only know to break stones and fetch water—what do we know of such things as balance sheets and bonus calculations?" (from a handbill of October 1972). The leaders were

clearly out of step with the transformation taking place within the workforce. As stated earlier, the new workforce was young and educated. Some among them sat down with the balance sheets and the bonus formula as per the Payment of Bonus Act and actually calculated the allocable surplus and published a handbill showing how the allocable surplus available for bonus was 30 per cent.

The union and the company then revised the settlement and paid 24.5 per cent bonus for the year 1972-73 of which 6.5 per cent was treated as arrears for previous year (Siemens Kamgar August 1980).

All bureaucracies believe that once invested with power people do not matter and stumble from crisis to crisis until they are finally swept away by forces they cannot comprehend. The aspirations of the workers or their anxieties did not weigh with the union leadership at the time of the revised bonus settlement. Company officials and the union leadership both viewed the bonus issue as merely a clamour for more money—which if paid would quieten the workers. On the contrary, exactly the opposite happened. The workers were now even more determined than before that they should have a union over which they had total control. Henceforth with each struggle the democratic consciousness deepened until by 1987 it had come to reside within their consciousness as an indelible part of their being.

In 1973 the workers formed a new union called the Siemens Employees Union. This was an internal trade union without any outside leadership. The workers in their simplistic notion of democracy believed that numbers alone mattered. If a majority of the workers supported the new union then the company would have to recognise them at some point of time. This was the understanding. What they did not reckon with was that when trade unions become infused into the company's power structure and become part of the power structure they do not simply dissolve, pack up and go home. Managers too cannot just abandon leaders who have become enmeshed in their organisational structures for that would amount to amputation of a small part of their organisation itself. If in 1965 the company's managers held out internal unions as a panacea for industrial strife, in 1973 when the union was completely internal without even notional outsiders the same managers made a somersault and considered the new union as being 'irresponsible mob rule' and 'what was a familiar old refrain against democracy'.

From 1973 onwards until 1987 the company dealt only with a minority union. This fact has important bearings on the present. It created definite managerial attitudes to labour and trade unions. Militant elements from the new union were dismissed. The technique adopted for dealing with the rest was to ignore them totally. Certain methods evolved during this period came to be

perfected in the following years. The most important one was not to resolve any problem however small if the workers came through the new union. All problems big or small were, as a matter of fact, resolved only if they came through the old union. This policy is akin to sanctions imposed against nations. People get weary and finally lose spirit. But the point about sanctions is that the trauma remains for a long time to come.

The Siemens Employees Union petered out. The imposition of political emergency and the general environment then prevailing only hastened the process. The experience however remained with the workers. For effective implementation of the policy of sanctions it had become necessary to deal with shop level committee members of the old union who were workers in the factory. This led to the strengthening of the bureaucracy. But it also led to building up of certain workers loyal to the outside leaders as 'leaders' in the eyes of the workers which had not existed earlier. Of that later. The strengthening of the worker level leaders in the old union led to a close nexus and sense of solidarity between them and the managers and officers. Through the turbulent period of what is commonly referred to as the '1976 struggle' and the '1981 struggle', these relationships consolidated, matured and grew to a point where severing them was impossible. In 1987 workers finally managed to oust the old leadership and brought in new leaders, but the structures and relationships built over the years from 1973 to 1987 could not be dislodged. As is common with all organisations changes at the top do not bring change down the line, they only create convulsions and confusions. This is one of the reasons for the present impasse.

The production managers or other managers at other level had little or no say in evolving this policy of dealing with the internal union nor is there any evidence to suggest that they attempted to do so. Towards the beginning of 1975 the workers began to feel the hopelessness of the situation and pressure began to mount for bringing in some outside leader who was strong or influential. However no consensus could emerge any particular outside leader. Some efforts were made by a section of the workers to bring in the Bharatiya Kamgar Sena as it had a militant image then (various handbills of the Association of Engineering Workers). However it was not a whole hearted effort. There were also small flirtations with smaller Congress leaders. One thing the workers were clear they did not want any 'leftist' leaders. But before anything further could happen the national emergency was declared in the country and all trade union simply withdrew from any confrontation or struggle of any sort.

The last wages settlement had been signed in May 1972 and was to expire by September 1974. Over a hundred odd meetings took place between union leaders and

managers between September 1974 and November 1976 at the end of which a settlement was signed—during the emergency—that gave the workers an *ad hoc* increase of Rs 45 by way of house rent allowance at a time when the company had performed exceedingly well (Handbills of dissident group, June 1977). Two reasons seem to have contributed to this. One was the political situation that put unions on the retreat. More important at the immediate level was the fact that the 1973 experience of a new union, being formed and its petering out, had given both the old union leadership and the management the confidence that they could together put down the workers and further, that the workers really did not matter. In addition there was the fact that over the years no second line leadership had emerged in the company. When during the emergency the chief personnel manager was out of operation being in detention for political reasons, personnel matters in the company simply drifted rudderless.

The Rs 45 settlement finally became the albatross around the company's neck. The officers of the company and the union were certain that they had finally vanquished the workers and sealed the coffin of revolt for good. Thus throughout those at the helm of affairs of the company and union kept reacting to symptoms and never delved into the causes of the dissatisfaction. The Rs 45 settlement however became the *casus belli* for what came to be called the '78 struggle.

V

The lifting of the emergency everywhere in the country and more particularly in the Bombay region unleashed forces of pentup anger forcibly repressed during the emergency. The traditional trade union leaderships of whatever ideological and political hue had compromised itself thoroughly not only with the political establishment but also the companies and managements where they represented workers and buckled under the emergency. The employers and companies too had made optimum use of the situation to suppress workers. The lifting of the emergency therefore, brought about fundamental changes in the perception of the workers. On the one hand there was a great need to confront managements in order to halt the trend of falling wages or stagnation of the wages which had been brought about by the emergency. On the other hand the political-ideological-rule of law type of trade union leadership had proved itself to be utterly helpless at the time of the working classes' deepest hour of need. The search then shifted to a non ideological, non political collective bargaining with a militant leadership. The workers in Siemens who had in any case been on the look out for a strong outside leader before the emergency were part of this general atmosphere—the seeth-

ing intensity was still latent then like the proverbial calm before the storm. Datta Samant filled the vacant slot in Bombay's new trade union vacuum. The situation then was that if Datta Samant had not existed the workers of Bombay would have had to create one. The Siemens workers very naturally became a part of this general wave—it would hardly be an exaggeration to say they were amongst those who had spearheaded the wave in Bombay (Business Standard, reports in March and April 1978). But they made one last ditch move to resolve the leadership crisis by some legal constitutional means.

Soon after the emergency was lifted, a section of the workers belonging to the officially recognised union, the Siemens Workers Union, made a last effort to overthrow the outside leaders through internal union elections. For the first time union elections were called for, where the post of the president was contested by the worker leaders themselves. This was unprecedented in the union's history. These efforts however failed for two important reasons: the leaders who sought to oust the president of the recognised union, belonged essentially to the group of older workers—who were suspicious of the young militants who had spearheaded the independent union viz, the Siemens Employees' Union in 1972, and who were still restive and agitated causing the grassroots pressures on the leadership of the union. These sections were therefore sought to be kept aside. With the most resolute opponents of the established leadership thus kept out, the opposition within the Siemens Workers' Union emerged as an indecisive and vacillating one. The leaders of the established union found it easy to outwit and outmanoeuvre them in organisational technicalities.

These efforts having failed, what remained was a restive workforce, a vacuum in trade union leadership and insensitive and belligerent management. Under the prevailing circumstances Datta Samant seemed the natural answer. The workers who had spearheaded the 1972 agitation found no alternative than to join the Samant wave—and thus by the end of 1977, an overwhelming majority of the workers found themselves in the vortex of the Samant wave. This time however, it was a desperate workforce, with no hopes for the future, no faith whatsoever in the management, ready for a no-holds-barred, do-or-die fight. The leadership of the company, faced with such a crisis responded with an all out offensive against its most productive workforce. Such an offensive however unless the established union leadership was ready to abdicate its independence altogether and identify itself totally with the company—which it did. From this point onwards the union leaders and company officials worked as one cohesive team against the majority of its workforce. Hitherto the co-operation and co-ordination was between two distinct organisations—now it was as

though these organisations had merged and amalgamated—the merger took place not just at the level of the top leaders of the company and the union but down the ranks to the personnel officers and workers officials. Years later, some of the officials of the company would recall that the union officials would actively suggest ways and means of dealing with the workers and all steps were theirs undertaken jointly by them.

The first salvo was fired by the company when in December 1977 on dubious charges of minor assault the company suspended and chargesheeted the leading persons who had fallen out with the Siemens Workers' Union leaders and had taken a lead in joining Datta Samant. Fresh out of the emergency atmosphere the company's officials had clearly miscalculated the latent anger of the workers. The prevailing impression amongst the union leaders as well as the company officials was that the Siemens workers were 'bourgeoisified' or 'aristocratix' and would never sustain a Samant type of struggle—ironically the Siemens workers along with others in Godrej, Premier and other industries became the trend-setters of the Samant wave and were the centre of it.

The suspension of key workers led to a slowing down production, which in turn led to indiscipline and near riots on the shop floor between supporters of the established union leadership and officers on the one hand and the agitating majority of the workers on the other. The company declared a lockout in February 1978 which was followed by a strike which continued for 10 months till November, 1978. During this time violence broke out among workers and two workers died. One more died in a dispute relating to village politics, but both the union leaders and the company continued to regard that as a part of the company's labour unrest despite a session court verdict to the contrary. Over 80 workers were dismissed during the period. Above all the company mobilised the administrative-police and government machinery and resorted to the selective use of the judiciary to push the workers against the wall. It also recruited nearly 350-400 workers, a number of them with known criminal backgrounds. While these recruitments helped in bolstering the moral of the loyal workers in the short run later it would lead to the problem of excess workers and add to the problem of unproductive workforce.

For the agitating workers, the young skilled workers, this was their first major confrontation with the political-administrative-police establishment outside the company. The company took the unprecedented step of dismissing 950 workers which created history of sorts in trade union circles in the city and invited a sharp reaction from all major unions and organisations. The demand for a secret ballot as a means of determining the union's recognition was a key demand of the Siemens workers. At that time

Siemens workers were at the forefront of the Bombay workers' struggle to get the state government to make it statutory for unions to accept secret ballot as a means of determining membership and recognition issues. The Maharashtra government, in fact introduced a bill in the assembly session at Nagpur in 1978, for making secret ballot a statutory means of determining membership issues. The bill subsequently lapsed. Industrial relations between the company and its workers had transcended the parameters of industrial relations and had become class-struggle with wider ramifications on the struggles of workers outside the four walls of the company. An examination of the aspect however, is not within the scope of this paper. By the end of 1978, the company was in the vortex of a civil war with its workforce.

TECHNOLOGICAL CHANGE

If the changes and expressions of 1964 gave the company the character of a regular manufacturing and factory culture—necessitating the introduction of the rudiments of personnel management into the company—the expansions of the 1970s were more far-reaching inasmuch as it changed the character and stature of the company. Above all it brought about technological changes and changes in the work processes on a large-scale. The nature of changes can be gauged from the changes in the product range—in 1971 the company produced (i) switchgear items including transformers and signalling relays, (ii) L and T and NT switch boards, (iii) electrical motors/generators, and (iv) x-ray equipment (Annual Report 1971). In 1981 the company produced: (i) switchgear items; (ii) electrical motors/generators; (iii) switch boards, control boards and miscellaneous accessories; (iv) x-ray equipment; (v) dental x-ray units; (vi) measuring and control instruments; (vii) signalling relays—wave traps and high frequency compiling filters etc; (viii) rectifiers cubicles and miscellaneous equipment; (ix) variable speed AC/DC drive systems and motor control modules; (x) AC/DC machines; (xi) cables and wires, (xii) transformers (Annual Report 1982).

The nature and extent of this phase of expansion can also be seen from the number of technical and financial collaborations agreements, during this period between Siemens AG and Siemens India, between 1957 to 1976 there were four such agreements. In the year 1976 however, there were at least six collaboration agreements with the German parent and almost all of them were for only technical collaborations. There was thus at least one agreement each year. In 1970 the company signed a collaboration agreement for dental units, in 1972 for railway signalling equipment, in 1973 for railways signalling equipment and electric axle counters, in 1974 for motors switchgears

and switch boards, in 1975 for AC synchronous machines and DC machines, in 1976 for relay group block instrumentation, electrical point machine, etc. During all this expansion labour was only one of the factors of production and this commodity was taken into account in all these expansion—the consideration was purely the economic aspects of labour (*Arms of an Octopus* booklet by Research Unit of Political Economy). This economic factor of production, the commodity labour, however, is also human and therefore responds and reacts to the situation it finds itself in. It would seem logical to expect that the role and functions of industrial relations as a science should be to identify the contradictions between labour as commodity and as a collection of human beings, and deal with them in anticipation of events and reactions or at least when the contradictions surface. Yet, despite all the growth and development of industrial psychology, organisational behaviour and what have-you, industrial relations has remained a fire fighting exercise—which is undertaken at a point when crises threatens to engulf the entire organisation.

All other aspects of production are planned and future predictions and targets identified. Thus there are estimations of profits, planning of production targets, financial forecasting and the futurological exercises undertaken in large organisations—but in relation to labour, only aspects like human-power is planned. The effect of the changes in the company or industrial relations is an aspect that is neither anticipated nor are any effective strategies worked out to pre-empt major disruptions. As a result a lag develops between production processes and relations. Thus in Siemens, in the early 70s, expansion plans were made, lands were acquired in Kalwa, technical collaboration agreements signed, etc. The agreements between Siemens AG and Siemens at the time of planning the Kalwa factory included a number of items of the smallest detail including lay-out of the factory and production schedules.

Industrial relations was viewed as recruitment, placement training, etc, that recruitment on a big scale also brought in new people, with new aspirations and psyche, that they needed to be accommodated and assimilated in the company's organisational structure which includes not merely the workplaces but also the institutions and structures like the unions, personnel management, shop level worker-junior engineer relations, was never considered to have anything to do with industrial relations. Every work process is not confined to the machines, the manning of machines and its lay out. It includes a definite set of relationships between people in the organisation *inter se*—when the work processes change these relationships must change—when the organisation stifles this change or shackles it, it leads to a crisis—leading to replacement of the relationships in conformity with the changes in

the production processes

The expansion of the company, the induction of a new young and skilled workforce and trained technical personnel called for weaving new relationships and making the growth and the transition as smooth as possible. The tone and tenor of industrial relations in the company was set by the 1964 strike the breaking of the strike by forming a group of black legs was a primitive and feudal approach to industrial relations. The subsequent bureaucratisation was more suitable for an unskilled under educated workforce of the old 'school' of workers and the imperial industrial relations methods of the company was also suitable for the kind of technological level and work processes prevalent at that time but hardly suitable for the changed circumstances. But those at the helm of affairs in charge of industrial relations were barely in a position to understand this, being themselves part of the old feudal mould. The agreements between Siemens AG and Siemens could provide for the planning of personnel—establishment of a list of skilled and unskilled labour and personnel for the manufacture, etc.—but could hardly recommend a purge of the organisation as a necessary condition for successful expansion.

VI

The old relationships that had been established over the years had now grown roots and consolidated to a point where a violent, bitter war was inevitable—the new needs of the organisation were sought to be put down by repression and brute force.

By the end of 1978 over 80 workers had been dismissed for involvement in riots and other offences, and hundreds of others kept out, pending scrutiny by the company. The majority of the workers who returned to work, did so carrying with them a whole new experience and hardenened by the year long strike and lock out. With a sullen demoralised workforce, production levels refused to register any rise even after the lifting of the lock out by the end of 1978. Productivity of workers which had been 70.7 per cent in 1970-71 dipped to rock bottom level in 1978 and rose to 44.7 per cent in 1979-80. The established recognised union demanded more and more privileges for itself as it had stood by the company in its hour of need. They pushed for a policy of discrimination amongst workers on the basis of union affiliation. The officers identified more with the union due to the prolonged repression of the workers than with questions like improving productivity or morale of the workforce. They continued to actively pursue a policy of discrimination. For example in 1978, gift coupons were distributed to the members of the Siemens Workers Union and denied to the others. In 1979 *ad hoc ex gratia* amounts were paid to the workers on the basis of attendance in the

year 1978-79 which automatically disqualified workers who had been on strike/lockout in 1978. Above all workers who were not members of the Siemens Workers Union were not granted any promotions, or change of grades—even though in most cases they were better qualified for it—whereas workers who belonged to the union were given grades and promotions even though they were not suited for it. Scores of examples of such discrimination could be given. As a result the internal organisational structures maintained through a process of merits and reward system broke down. It was at this point when the entire edifice broke down, and productivity remained consistently low to a point when it began to threaten profits—that the alarm bells began ringing at the highest echelons of the company. Besides due to liberal industrial policies introduced during that time in the country, the company could no longer afford to be complacent about its monopoly market positions. Only then did revamping personnel policies and introducing organisational changes suited to its present phase of growth assume importance. Until now personnel management had been the exclusive domain of Indian managers. The parent company seldom interfered. Now, for the first time the parent company intervened, appointed a German works manager with widely enhanced powers to set things right.

The new German works manager introduced certain changes which had a dramatic impact on the entire organisation. For example, one of the first measures taken was to abolish separate canteens for German officers and workers and to set up a common canteen for all. Such a measure was only symbolic, but in a situation where the morale of the entire organisation both among officers and workers was at rock bottom, even symbolic measures had an electrifying effect. Above all it conveyed the feeling that there was a change from the old and this change was eagerly watched by all concerned. The significance of the passing of personnel policies into new hands lay in the fact that for the first time the corporate philosophy of the German company was introduced in India. The concept of the 'Siemens family' which had been studiously promoted in the parent company since 1880s or thereabouts and developed to a point of perfection came to be introduced for the first time in India. Prior to 1969, the company itself was emerging out of its small manufacturing role. Its India operations had expanded and grown, but, 'the organisational psyche had not grown correspondingly. There was no concept of professional management. Personnel management and industrial relations were *ad hoc* oriented by a political feudal hierarchical approach. It was the 1978 struggle which compelled the company to sit up and take notice of the lag in the organisation, growth and productivity

and the corresponding organisational changes required to keep pace with it. Among the changes introduced in 1981, the most important was ideological. Frieder Schlupp argues how the idea of the Siemens family is developed as a holistic concept amongst its employees.

Instead even the chairman of Siemens, Hesamibetriebsrat and Vice-Chairman of Siemens Aufsichtsrat Ferdinand Turek already over thirteen years in this position praised 'spirit of Siemens—the mystic of the family Siemens and Siemens (Corporation) family and is openly identifying with it and working for Siemens seemingly took a quasi religious quality like two English authors (Robert Heller and Norris Willat) have already noted recently (Frieder Schlupp in Siemens, Notes on a German Transnational Corporation', *Transnational Information Exchanges* June 1980).

Now for the first time the company began to propagate the concept of the Siemens family and perpetuate the mystic about Siemens family in India. This they did by publishing regular news letters to family members of the workers, bulletins about the company's work etc. They also introduced for the first time symbolic gestures, such as 'open house' where on one day in every year the workers are allowed to bring their family to the factory and how them around.

VII

However ideology alone does not lift the level of productivity. For the first time more modern techniques of productivity, such as human resources development, came to be introduced. The company now began to focus on work systems rather than workers alone by introducing changes in work systems, manpower planning and work supervision and strengthening the industrial engineering department and work supervision. The company took the first steps to raise the falling productivity of workers. The company also granted marginal increases in basic pay and allowances (Management Information Bulletins). But the increase in pay was also linked to production inasmuch as for the first time, the company introduced production incentive bonus and also modified the job classification agreement by introducing greater flexibility in manpower utilisation. All this improved the situation somewhat and the productivity went up from 44.3 per cent in 1979-80 to 53.9 per cent in 1980-81. While introducing changes in production systems was simple, changes in personnel policies were not. The introduction of the changes in production systems presupposed two important things. Firstly, that the co-operation of the workers was forthcoming. Secondly the changes presupposed that line managers and production managers would have greater say in matters relating to the workers.

As far as the co-operation of the workers

was concerned, their morale continued to be low. In fact, in 1981, the workers started what is popularly referred to as the 1981 struggle. This time, the workmen went on a massive go-slow. Whatever improvement in productivity that was brought about by the changes in the system was offset by the go-slow in 1981 and the excessive manpower created due to the strike recruitment. Even the 1981 settlement, which gives rises in the pay of the workmen failed to have effect in raising productivity. Once again, the company fell into the common track of believing that the workers could be bought with increases in pay and once again, the rationale behind this failed. During the 1981 struggle over 450 workers were suspended, many of them repeatedly for go-slow. These suspension were continued inspite of court orders staying the suspensions. In the realm of personnel management and industrial relations, the new works manager found it virtually impossible to dislodge the power structure which had followed old policies. A cleavage developed between the works manager and the chief personnel manager over the policies to be pursued.

The problem before the company was how to enlist the co operation of the workers for introducing organisational changes in production methods when the majority of workers were virtually de unionised. Communication with the workforce had broken down. There were no organisational forums through which such communications could be built and the recognised union had now lost all legitimacy. At the same time the company was not in a position to abandon the recognised union for reasons discussed earlier. Hence the company had to establish forums to directly communicate with workers. This necessarily meant openness in the functioning of the company, access to information and democratisation of the company's functioning vis a vis the workers at large. Thus, during this period, massive shop level meetings of workmen were addressed by the works manager directly. Posters came to be put up all over the company for the first time informing the workers about the company's production targets, actual production achieved against targets, financial position, etc. Productivity charts came to be displayed all over the shops. Suggestions schemes were introduced. Though the company was compelled to introduce more open management due to decimation of the workers organisation and precisely in order to avoid recognising the trade union truly representing them. To the workers whose entire struggle had been founded on democratic trade unionism this change only enhanced their strength.

The excess workforce created due to the strike recruitment was sought to be ruined, but, the pruning was done not by removing direct recruits (this could not be done as it would involve retrenchment requiring government permission under law), but by two means. In 1982 the rationalisation agreement

was signed by the recognised union (Rationalisation settlement, November 5, 1982). This effectively undid past classifications and gave the company a free hand to introduce any kind of technology, rationalisation, standardisation and improve plant technic. It clubbed jobs and trades and allowed the company to transfer workers not merely from one unit to another and from one plant to another. The recognised union leadership agreed to all these major concessions in return for only one thing, namely, recognition to itself. The rationalisation only added to the surplus workforce. A voluntary retirement scheme was, therefore, introduced in 1982 under which the company 'persuaded' all old workers, unskilled workers and those with bad attendance records to leave. By these means, between 1983 and 1984 the workforce was reduced by 8 per cent. The works manager was now concentrating only on improvement in productivity and production. Hence, the emphasis was to remove the unproductive workforce. This line was directly opposed to the line of the personnel management in as much as removing the most unproductive workforce meant removing followers of the recognised union. However, in the balance of power then obtaining the works management was more powerful. This led to substantial weakening of the recognised union and also the power wielded by the personnel management within the company.

Despite the changes which were introduced in 1980 principally due to 1981 struggle the new policy of the works manager continued to discriminate against workers who were not members of recognised union. The discrimination continued with respect to grades, promotions, transfers, etc. The rationalisation introduction of new technology and new work systems however require the more skilled and more competent workers to man crucial positions and such workers were found only among the rebel sections. With the increasing power to line managers and production managers they also became more articulate. These were people who rubbed shoulders with the workers on the shopfloors and hence they could see how counter productive were the discriminatory policies. They first of all began openly to express their reservations about this policy of discrimination. With the weakening of the personnel management and therefore the recognised union it became difficult to continue such discriminatory policies. By the end of 1984 there was a perceptible shift and there were at least some workers from the rebel rank who began to be given grades and promotions. With this the recognised union lost whatever little clout or influence it could wield in such matters. Productivity during this period registered further increases but had not reached optimum levels. Thus during this period (1981-85) the policies relating to work process and work organisation were directly contradictory and conflicting with

the personnel policies—the opposite pulls would not resolve the organisational crisis, it only enhanced it.

By 1985, the modernisation and introduction of new machinery, both computerised and otherwise, was nearly complete. But, this modernising also called for new managers, particularly technical. In the personnel management a number of managers had to leave or were demoralised and shunted out or had to retire. Due to these reasons, new managers had to be recruited in the personnel section also. As a result, there was a whole new generation of managers. The approach of these new managers to both production and personnel policies was 'ahistorical'. They were neither inclined to nor in a position to understand the whole history and significance of the history of industrial relations in the company. Besides, they were neither committed to nor involved with one or the other section of the workers or managers. However, being new, they were hardly in a position to influence personnel policies. In 1985, due to the weakening of the personnel management, the recognised union collapsed. But, that was only after an agreement was signed granting substantial wage increases and production incentives. Ironically it was when the recognised union was at its weakest phase and on the verge of collapse that the highest wage increases were granted. As in all organisations, decline brings about conflicts and between 1985 and 1986 the remains of the old leadership fell out mutually with one another.

The rebel workers now rallied under a new leadership which was a participant in the 1972, 1978 and 1981 struggles, but did not lead any of them. This new leadership was tempered in struggle and therefore, for the first time, began to take into consideration the organisational balance of forces, perspective and power structure within the company and their effect on the workers own struggle. They were able to evaluate and assess what management meant, what the company consisted of and the need for understanding the organisational imperative of both the company and the workers for any successful move. It was the understanding of these issues that made them decide to join the recognised union *en masse*. The changes in the personnel management and the weakening of their powers made it difficult for them to prevent such steps by the workers. The rebel workers joining recognised union meant recognising them and meant changes in the leadership of the recognised union. The new managers could not understand the historical significance of the rebel workers joining the recognised union. They welcomed what was apparently a very good sensible move. With the rebel workers joining recognised union, pressure on the leadership for change mounted. This time, due to the weakening of the union and due to the consequent fall out among the leadership mutually and the weakening of the personnel

management committed to the recognised union in the company, it was impossible to resist the change. Thus, the struggle for change in leadership, which commenced in 1972, ended in 1987 the president declined to contest in view of his imminent defeat.

The new leadership had by now a clear perspective on what kind of union they wanted to run. Democratic trade unionism was the foundation of their very movement. It achieved culmination when 1987 elections were held. These elections were significant for several reasons. For the first time, the entire election was by secret ballot. An election officer was appointed as an independent body with persons to assist him. Proper nominations were invited, dates for withdrawal of nominations were given and printed ballots were used. The other major feature of this election was that constituencies were created whereby every shop had a representative. In general council some 80 members were elected by every shop constituency comprising of around 20 to 25 workers. Then, each unit had a unit secretary and the central office bearers were directly elected. The lopsided representation of shops and units was done away with while at the same time ensuring that the central leadership, namely, president, vice-presidents, secretaries and treasurer, were elected by entire membership. This system ensured a voice to every member of the organisation. The election process itself could materialise only due to protracted negotiations between different factions and groups. Hence, various factions and groups were represented in the elections. The panel finally elected thus comprised of representatives from different factions and groups.

VIII

The 1987 elections marked a watershed in the history of industrial relations in the company inasmuch as the rebel workers dominated the union. The years 1987-1988 and 1989 registered record levels of productivity, record production, they were also the years when major agreements such as shifting of certain processes from Bombay to Nasik, etc., were resolved to the satisfaction of workers by direct negotiations and hard bargaining on either side. For a very brief period there was classical 'collective bargaining'. This only enhanced the stature of the new leadership in the company, as well as in the union. The new managers were able to show dynamism and flexibility in the negotiation processes whereas the new leadership in the union responded to the same.

The new union leadership also took the democracy business very seriously. They not only spoke about democracy, but actually began to implement the same in day to day functioning. Thus powers were delegated and all unit secretaries were actually made responsible for resolving the problems concerning their units; all general council members were actually made responsible for

reporting problems of their constituencies to the unit secretary. Only if the unit secretary could not effectively handle the problem, was it brought to the general secretary or joint secretary or to the central leaders. Only wage negotiations and general agreements were handled by the central leaders. All this brought about harsh reactions from the personnel managers, particularly the older ones for now they had to deal with a wide cross-section of leaders. In the old days, there was only one person or two they had to deal with in regard to the entire factory's problems. This made things simple as the relationships were established. But dealing with five unit secretaries and a large number of general council members meant dealing with wide variety of people and therefore, dealing not on the basis of personal relationships, but on the basis of principles relating to the problems and issues. This meant that personnel management could no longer sit back and take it easy. It meant that they had to show skill, dexterity and fairness in their dealings. It meant that personnel managers had to actually 'manage'. All this made the personnel managers, especially the older ones, extremely uneasy with the new leadership. The democratisation of the union also made the union much stronger than it was before.

For the first time in its history managers had to recognise a union which had the support of the majority of the workforce. This also created insecurity among the personnel management staff. A strong and independent union was against the basic 'corporate culture' of the company and the personnel management simply could not deal with such a situation. Personnel management felt threatened and was agreed on the point that the new leadership needed their wings clipped but they had no common strategy on how to go about doing that. Some officers began to cultivate one or two persons in the new committee and interfering in the internal affairs in the union knowing that the new committee consisted of groups and factions.

What they did not realise was that the groups and factions had become irrelevant with the changes in the organisation of the company and the union. There had been a shift of people on either side, across groups and factions. Thus, recruits who were recruited to break the strike in 1987 after being confirmed as permanent employees switched over to the new leadership, as they were also young and naturally attracted by the younger leadership. Conversely, old workers and less skilled workers who had been part of 1972-1978 and 1981 struggles no longer identified with the new leadership and became sympathetic to the older leaders. These changes which had not erupted perceptibly in 1987 had begun to manifest as dissensions amongst new and old leaders in 1988. But with the majority of the workers supporting the new leadership such dissension merely remained at the surface. During

this phase the conflicts in industrial relation assumed a generational character, with old and new managers taking different confusing lines on the differences between old and new worker leaders. The historical approach of the company's personnel management made them believe that such dissensions could be exploited to their benefit by the cultivation of certain leaders in the new leadership. For this purpose the company chose persons who were labelled widely as black legs for the role they performed in breaking the 1965 strike. Since the general approach of the personnel policies were 'ahistorical' these considerations never mattered. Besides, only such persons would be willing to be wooed by the company. Throughout 1989 the creation of dissensions within the leadership became the key function. However, the entire experience of the workers from 1965 onwards had given them a certain maturity and consciousness and besides the real democratic functioning of the union ensured that problems were discussed openly and all decisions were by consensus and therefore the dissidents were not in a position to affect the organisation in any significant manner. The wooing by the company however gave these workers a bloated idea of their own worth. Toward the middle of 1989 it became evident to sections of the personnel management especially the new and young manager that the policy of creating dissensions would not work. Even those who had gone along with the policies in the beginning now backed tracked. However once again, there was no common consensus to back out of such policies amongst the managers.

The structure of management in the meantime came under heavy strain. The induction of a large number of new managers

and officers brought with it problems of adjustment within the organisation. For the first time in the history of the company, the officers formed their own association in 1985. This was the first indication that something was very seriously wrong with the company's leadership. But the symptom went unattended due to the drift caused by a weakened personnel management. Another important development was that in 1988-89 the company took the first step towards decentralising by divisionalisation of the company on the basis of product line. This decentralisation brought about several centres of authority in the place of one. Thus, earlier on the management structure was perceived as a clear pyramid the hierarchy was clear. With divisionalisation, each divisional head became a director in his own right. There were thus 6 divisional heads heading different product divisions. More than this, what affected the power structure of the organisation was the creation of three more divisions which cut across the product divisions, namely finance, personnel and production. These three divisions run across the other six divisions. Therefore there were one three power centres in each division. There was thus no unified command structure which could provide effective leadership to the company. This was more so with regard to personnel management inasmuch as the personnel management which had already been weakened over the years for reasons discussed earlier further weakened by not being made into a full fledged division with its own divisional head. The scenario towards the end of 1989 was a strong participative and democratic tradition and a weak personnel management. Such a scene is bound to create problems which are unique and different from the usual industrial relations problems.

As a result the industrial relations policies were directionless and confused. Changing course every now and then depending on the vacillations in the power equations of the company. Thus the policy of testing dissensions and promoting certain dissident leader, which was begun in 1989 by some more towards end of 1989 but not abandoned at all by others right through 1990. Galbraith argues that 'psychic' of the management of company often resemble the product which they manufacture. According to him, 'all great executives come to resemble intellectually the product they manufacture. Until you had done business at length with top officers of the Steel Corporation, you didn't really appreciate the intellectual qualities of a billet of steel' (Galbraith Menchikov in *Capitalist Communism and Coexistence*).

In Siemens in the beginning of 1990 the managers in the company were intellectually like the panel boards the company manufactured with scores of wires and intertwining and ending in numerous switches and controls.

IX

The old leaders who found that the democratic function was making their continued existence in power impossible, encouraged by the drift in the management began confronting the new union leadership. In the very nature of things such confrontation could not be on the shop-floor in view of the fact that two third of the members were staunchly with the new union leadership and of the remaining 1/3rd a significant number were fence sitters. The dispute took a form of numerous litigation and strongly contested court room battles. The managers who encouraged them did not want trouble on the shop floor and began to actively advise litigation. But this affected neither the workers nor the company, nor the new union leadership inasmuch as nobody was affected directly by litigation. It merely meant expending resources which both the union as well as the company was in a position to do. What it did do was to give the old leaders an exaggerated self importance. Soon they felt with a section of managers on their side they would get away with anything. With a support of around 700 or so out of 3000 they began to indulge in go slow ghettos and other forms of agitation. Those who had come to represent bureaucratic style of functioning now sought hopes of coming back to power ousting the new democratic leadership with the help of management support. What started as pressure tactics thus grew into open conflict. The management had gone along with this line initially as they all wanted for various reasons to clip the wings of new union leaders. When conflicts began to grow and the bureaucratic leadership began to stake claim to the union leadership many managers swung around and began to take fresh stock of the situation. They had only wanted to clip the wings and not kill the bird altogether. But things were taking a turn for which they had not bargained. Everywhere the workers were asking 'why was management causing all this trouble?' Since 1987 production had gone up, the productivity and profits had gone up, agreements were no major issue which either side felt could not be settled amicably. Then they asked 'why this trouble?' A number of managers also started asking the same question. A lead in this was taken by the production managers who had never had it so good before and did not want trouble or breakdown in production for any reason. This section of managers began to articulate their dissent. This dissent soon snowballed into a two line struggle within the management.

Perceiving the two lines, the old style leadership began to push for recognition from the management. Matters reached ahead with the strike call and call for go slow. This had no perceptible effect on the production, as the majority of workers i.e. 2/3rd and that too of the most productive workforce

was with the new style leaders. One section of the managers began to insist on disciplinary action against strikes and slow-downers, the other section resisted. The management appeared indecisive and vacillating, i.e. not in a position to 'manage'.

On the majority the workers, however, this indecisiveness and vacillation had a dramatic effect on their consciousness. It revived in them old memories of harsh actions management was capable of taking *a la* 1978, 1981 struggles which it was not taking now. They had an idea of the full extent of management powers and if they were not being exercised it could only be because the management wished to foist old style leaders the blacklegs and bureaucrats on the workers. This was how the general mass of the workers perceived the situation and rallied behind new style leaders with fervour and commitment.

The old style leaders too began to question the management. They had got to this point with the tacit support and understanding of section of the management. Their anxiety was what if it failed to keep its promise or lose out in the two line struggle. For them it was absolutely necessary to push the differences within the management to a decisive stage. The section of the management supporting them was also convinced that to win in the two lines it must end decisively in favour of the old style leaders. In this line within the company that called for recognising and coming to terms with its most productive workforce was the new and up and coming force. It also called for changes in organisational relationships and personnel. It was in keeping with the objective needs of the company hence irrepressible. The other line that promoted the unproductive workforce was in conflict with the objective needs of the company. Yet being old, it was in conformity with the company's culture it was self regenerating and hence equally irrepressible. The two contending forces could only be resolved if there were serious self backs in production and productivity. This had not happened so far due to the neutral stand of the union and the new leaders in the two line could in the company. Such neutrality however, could not continue indefinitely. Sooner rather than later the company was heading for a showdown with the majority of its productive workforce, hitting production and productivity. Only then would organisational changes be brought about in conformity with its new needs. For this entire process the 'company' stood and as an alien force and confronted both its workers and managers as an alien entity.

Unable to carry the entire management with them, and coupled with the fact that the old style leaders lacked the ability to run an organisation independent of outside leaders, the forces of *status quo* in the company began to take charge of the situation and take recourse to legal moves. If legal sanction could be somehow received for old

style leaders the whole issue could be presented as need of obeisance to the law

Manipulative tactics came to replace personnel policies. Thus 535 workers were locked out for slow down, but a section of managers began to bend backwards to take them back. *Ex parte* orders taken against the company, the company was in no hurry to get it vacated. The entire strategy was to provoke the new leaders to violence. If that happened the entire workforce could be locked out, the situation reversed with the majority kept out and the minority in and the bogey of intra-union rivalry could be raised before the world at large. In most cases this would have been the result. An analysis of management. In this case the maturity of the new leadership and the high level of workers' consciousness due to the 1965, 1978, 1981 and 1987 experience pre-empted such intra-union conflict. The majority lead by new leaders appeared 'neutral' in the two line conflicts within the management in relation to their labour. This was an entirely new situation which observers students of labour movement, could not comprehend at all

X

CONCLUSION

(1) A large corporation is described as a state within a state. Like in state, certain production processes (which are determined by technology, market needs etc) give rise to definite relations of production within the organisation state. When production processes change, the relationship must also change. Changes in production processes are harbingers of changes in the organisation. The relationships are reinforcers of *status quo*—this is the key to understanding modern labour movements and industrial relations issues.

(2) Invariably a section of the worker/leaders are pitted against the workers at large in industrial conflicts. The genesis of the disunity in the labour movement is rooted in modern labour process itself. Failure to understand these processes renders working class unity an empty and antiquated slogan.

(3) In large companies the term 'management' is not a homogeneous thing. Management itself is subjected to pulls and pressures and individuals find themselves on one side or another depending on their own positions in relation to the production processes in the organisation.

(4) Periodic crisis within the company (i.e., the organisation of capital) is an inevitable part of its growth and expansion. Idealistic notion of partnership between labour and capital and the notion of collective bargaining, corporate family not withstanding.

(5) Labour management conflicts can no longer be understood in terms of wages and service conditions alone. New indices of judging labour management conflicts need to be evolved.

ECOLOGY AND THE POLITICS OF SURVIVAL

Conflicts Over Natural Resources in India

VANDANA SHIVA

This book analyses ecology movements in contemporary society from a Third World perspective and shows that development not only generates conflicts over vital natural resources but also transforms commons into commodities to satisfy the needs of the market economy. From a Third World perspective, it examines the way ecology movements have questioned the validity of the dominant concepts and indicators of economic development in the world today.

Through rigorous case studies, the authors have proposed a theory of political development that encourages sustainable and equitable development and views development from the perspective of marginalised groups. They emphasise that multilateral development agencies generate conflicts over natural resources in the Third World by financing projects in sensitive areas like forestry and irrigation.

This path-breaking study will be of immense value to ecologists, development experts and activists, economists, agricultural scientists, planners and policy makers.

Leather Exports: An Illusory Boom?

Saurabh Sinha
Sanjay Sinha

This paper attempts to analyse the export performance of the Indian leather industry with a view to determining the constraints to the future growth of the industry in the context of the policy measures introduced in recent years to facilitate leather exports.

THE growth in exports of Indian leather and leather products over the last three decades, and particularly in recent years, has prompted a liberal use of hyperbole to describe the phenomenon. A council for leather exports (CLE) spokesman has called the growth of the Indian leather industry "a fascinating story". Commenting on the continually increasing value of exports the annual barometer of progress in the region, the *Asia Pacific Leather Yearbook* (1989), has asserted that "India's leather industry has come of age in a most emphatic style". Even the normally prosaic Planning Commission documents could not help acknowledging the "phenomenal spurt" in exports of leather goods "not known to the industry before".¹

I

Export Performance

Table 1 provides a historical perspective on the growth of leather exports since 1956-57. In rupee value terms, leather exports have indeed recorded an impressive growth over the past two decades. While the 16-year period 1956-57 to 1972-73 yielded a six-fold increase in export value, exports in the subsequent 17-year period (1972-73 to 1989-90) increased by nearly 11 times. Trend figures available for 1990-91 indicate that exports have almost tripled over the last four years (1986-87 to 1990-91). Thus, the value of exports has increased at an average rate of more than 14 per cent per annum during 1956-91. In the 17 years (to 1989-90) since the implementation of the Seetharamaiah Committee recommendations (refer the Appendix 1), the growth of the rupee value of leather exports averaged 15.2 per cent per annum. Over the past five years this growth rate has increased phenomenally to nearly 28 per cent.

The small share of finished leather and leather products in India's total leather exports, and its limiting effect on foreign exchange earnings, was a major concern of the Seetharamaiah Committee. Table 1 indicates the extent to which this concern was justified in the case of leather products which constituted less than 10 per cent of the total almost consistently up to that time. Indeed, even finished leather exports constituted just 9.3 per cent of the total in 1972-73 and semi-finished leather made up as much as 82.9 per cent. The measures instituted on the recommendations of the committee appear to have yielded extremely satisfactory results as the share of finished leather in the total

increased to 19 per cent in 1974-75, barely two years after implementation. By 1980-81 this share had increased to 36.7 per cent and that of leather products to 31 per cent.

By 1980-81, concern came to be felt that the proportion of finished leather, rather than 'value added' products in total leather exports was excessive. On the basis of the recommendations of the Kaul Committee, measures were introduced at this time to improve the competitiveness of the leather products sector and to enhance its ability to take advantage of the anticipated growth in the international market in the 1980s. As discussed, the overall growth (in rupee terms) of leather exports in the 1980s was substantial and according to the figures in Table 1, the change in composition was reasonably satisfactory; the share of finished leather in the total declined to around 34 per cent by 1989-90 while that of leather products increased to nearly 65 per cent.

Appendix Table contains a more detailed disaggregation of Indian leather exports since 1972-73. Table 2 shows the composition of leather product exports since 1980-81. The main feature of note here is the importance of footwear components (mainly shoe uppers), rather than complete items of footwear in leather product exports. The share of footwear components in leather products rose from 36.8 per cent in 1980-81 to around 60 per cent in the mid-1980s. Further deregulation and conscious efforts to promote increased value addition in export products were introduced in the mid-1980s on the basis of the Pande Committee's recommendations. Since then, though footwear component exports have continued to grow, their share in total product exports declined to 39.4 per cent in 1989-90. The fastest growing sub-sector in recent years has been leather garments which has registered an annual growth rate of over 100 per cent over the five years since 1984-85. Other leather goods have also grown impressively at nearly 39 per cent per annum during this period.

Though this discussion has related the apparently impressive growth of Indian leather exports in recent years to the implementation of the recommendations of various official committees, it is interesting to examine this growth more closely. The following sections examine the growth of Indian leather exports in real (rather than nominal terms); assess the contribution of developments in the world market to that growth, and consider the motivations and

factors responsible for the nature of the export performance of the industry.

II

Real Value of Leather Exports

In a country with a substantial trade deficit, a depreciating exchange rate and a significant rate of inflation, trade figures in terms of current values of the domestic currency do not provide a very accurate picture of the contribution of the sector to the economy. More relevant is the growth rate of exports in terms of the real value of the currencies of countries which are India's major trading partners.

Table 3 presents a simple analysis of the export performance of the Indian leather industry. Though the value of exports increased by over five times in terms of current rupees over the period 1980-81 to 1989-90, at constant prices the increase was only by a factor of 2.8. Indeed, growth in real terms over the first half of the period was extremely low at 2.5 per cent per annum. In terms of (US) dollars, exports increased by a factor of 2.4, rising from \$ 505 million to \$ 1,218 million. In terms of constant dollars the increase was only by a factor of 2.11. Thus, in terms of the quantity of imports possible as a result of the leather industry's export effort, the increase was restricted to 111 per cent during the 1980s.² As Table 3 shows, the performance in the first part of the period was extremely poor though since 1985-86 growth has been encouraging—averaging more than 22 per cent in real terms.

While the poor performance of leather exports in the early part of the period can be explained by an economic recession in the major importing countries, its performance in recent years appears to be impressive. Yet there are other factors which preclude a sanguine view of recent developments; these factors include:

(i) **A declining growth rate:** Since the achievement of a high growth rate in exports after the implementation of the Seetharamaiah Committee recommendations, there was a marked slowing down with exports registering a much smaller increase, and even a decline, in value terms in the early 1980s. Global recession during 1981-83 adversely affected leather exports, however, from 1983-84 there has been a rather uneven rate of growth of exports. Since 1986-87 the decline in the growth of exports is consistent and unmistakable. The picture if viewed in dollars at constant prices is much worse

as by 1988-89 the rate of growth of exports was down to 10 per cent. While it increased by 14 per cent in 1989-90, inflation and devaluation of the Indian currency effectively nullify a substantial part of the increase that takes place. This seems to suggest an

impending stagnation in leather exports which is attributable to the Indian industry's tardy response to changing global preferences. India's exports are made up largely of finished leather and footwear components, they constitute more than 60 per cent of the

industry's export value. But the bulk of the global trade is in footwear. In 1987 global import of leather and leather products was an approximate US \$ 36 billion of which footwear alone accounted for more than US \$ 18 billion (or 51 per cent). Footwear components, on the other hand, constituted a meagre US \$ 1.5 billion. India's high profile presence in finished leather and footwear components (which together comprise only 17 per cent of the total global market) is thus of little significance in the world market.

Consumer performance has shifted to high quality footwear which is currently the fastest growing commodity group. A re-orientation of priorities towards making footwear the most important single item of export (as suggested by the Pande Committee) is required to enable Indian leather exports to break out of the impending stagnation and to acquire a larger share of the global leather trade.

(u) **Stagnation, if not decline in value realisation at constant prices.** Real value realisation from Indian leather exports is calculated in Table 3 as constant dollars realised for every (constant) Rs 100 worth of exports.¹ The figures obtained reveal a disturbing trend: value realisation fell from \$ 12.64 in 1980-81 to \$ 9.63 in 1984-85. Since then, there was virtual stagnation till it dropped to as low as \$ 9.54 in 1989-90. Thus each unit of exports is fetching only 75 per cent of the value today that it was fetching at the beginning of the 1980s. Contrary to the expectation that improving quality and the increasing importance of value added leather product in the composition of exports would improve value realisation, the latter has either declined or in recent years, stagnated. This could indicate either that the competitiveness (and quality) of Indian leather exports has suffered relative to other countries and as a result the margins earned by Indian exporters has declined or that quality has improved but the quantum of Indian exports has not increased significantly. Figures compiled by the Reserve Bank of India seem to suggest the latter in the case of footwear and footwear components but the former for other leather manufactures. Calculations based on these figures are presented in Table 4.

Though the average realisation per square foot in rupee terms has been increasing continually in 1985-86 finished leather was leaving India at an average rate of Rs 11.60 per square foot. This is an extremely low value and implies that a substantial percentage of leather exported by India is of a low grade. Some manufacturers do export high grade leather (at the rate of Rs 50 per square foot) but their number is very small. Similarly, the bulk of footwear export is of the cheaper variety fetching barely Rs 60 per pair. Again a few exporters are able to sell quality footwear at about \$ 18 a pair but since footwear accounts for barely 8 per cent of India's total exports (1988-89) and 0.5 per cent of the global footwear imports (1987), returns on footwear exports to India are

minimal. On the other hand, rupee trade areas (USSR and GDR) account for nearly 63 per cent of the country's export of footwear components. Rupee trade contributes little to foreign exchange earnings and both "qualitatively and design-wise the export to these countries differs from what goes to the USA and western Europe"⁴. There has been a constant effort to reduce the rupee trade percentage so as to increase export earnings.

Indian leather garments, on an average, command a reasonably good price in the world market which allows the garment exporters to pay a better price for sheep nappa leather. The garment position, on the whole, is quite comfortable but with regard to leather goods India is unable to command respect on account of use of poor quality leather and absence of quality assurance. Thus, even though the quantum of exports has increased, unit value realisation from leather goods is unsatisfactory.

Inadequate mechanisation, obsolete technology, unscientific management and production confined to small and cottage units have been identified as the main reasons for a low average unit value realisation. The major challenge for the leather industry lies in improving the unit value realisation from its exports.

III

World Market

The trends apparent from the above discussion are by no means encouraging and policy measures notwithstanding virtually indicate the failure of the domestic industry to achieve a significant qualitative improvement in its performance in the international market. To the extent that the performance of Indian leather exports has been encouraging in recent years, the influence of world market forces on it needs to be examined.

Over the past few years leather products have been imported increasingly by the leading consuming countries of the world. Finished leather, footwear, footwear components and leather garments constitute the major items of import.

Table 5 provides an indication of the global import situation during 1972-85. Except during the recession years 1981-82, global imports increased steadily and present trends suggest an annual increase of 10 per cent in world imports of leather and leather products. The global import of leather and leather products which was US \$ 21,310 million in 1985, is slated to exceed US \$ 31,000 million in 1990 and double that amount by the turn of century. The US, United Kingdom (UK), Germany, France, Netherlands, Canada, Australia, USSR and Japan are the main consumers of leather goods. Spain, Italy, Hungary, the Scandinavian countries, South Korea, Taiwan and Singapore are likely to emerge as important consumers of leather items in the 1990s.

Only five countries—the US, FRG, France, UK and Japan—accounted for 68

per cent of the total world import in 1985 as shown in Table 6. Over the years the US has emerged as the largest importer of consumer leather products accounting for more than 36 per cent of the global imports in 1985. In 1987, for instance, more than 82 per cent of USA's footwear consumption was met by imports. In FRG, UK and France, footwear imports range between 50 and 75 per cent. There is an unmistakable rise in import of various leather products in the developed countries. The per capita consumption of footwear in these countries is currently over 4-5 pairs. Customer preference is shifting increasingly towards leather apparel and leather garment imports meet as much as 75 per cent of domestic requirements. The continuing fall in the import of leather (raw or finished) along with a steady increase in the import of leather products indicates a decline of the leather industry in these countries, on the one hand, and a rising consumption level of leather products on the other.

An analysis of India's export performance reveals three distinct features. One, the export profile has been influenced strongly by the world import profile. Two, there has been a continual change in the composition of exports. Three, despite the growth recorded in the late 1970s and again from 1983, Indian leather exports comprised barely 2.7 per cent of the world market for leather and leather products in 1987. Indeed, exports from India accounted for a dismal 1.7 per cent of total leather imports into the five major consuming countries in 1985.

The general currency areas (GCA) among the industrialised countries are steadily emerging as the main market for Indian leather products. The four advanced market economies—US, FRG, UK and Italy—and USSR between them account for more than two thirds of Indian exports. Thus, Indian exports proceed in the same direction as the general trend in the world market. But this is both encouraging and disturbing. Encouraging since Indian products have established a presence in the major world markets, but disturbing because the industry has continuously to increase productivity and quality to survive the intense competition.

The figures available show that FRG has established itself as the leader amongst all destinations for Indian leather manufactures. In 1989-90, more than 18 per cent of India's exports (in value terms) were landing in the FRG. According to data compiled by

CLE, exports to FRG aggregated Rs 3,763 million in 1989-90 out of the total exports worth Rs 20,300 million.

The global trend is towards trade in value added leather products. The flow of leather goods from developing to developed countries has been rising whereas trade among developed countries for leather goods has declined. India has responded commendably to these changes but needs to cover substantial ground to establish a significant presence in the global leather market.

Leather footwear accounts for a major share of global import of leather and leather products. During 1987, over US \$ 18 billion worth of leather footwear was imported (Table 7). It formed nearly 51 per cent of global import. As mentioned previously, the world footwear market is currently dominated by South Korea, Taiwan, Brazil and Portugal in the lower and lower middle segments. In the higher middle and higher segments, Italy, Spain and France have a

very strong presence in the world India's share is less than 1 per cent which is insignificant. At the same time, it suggests the vast potential for growth if the leather footwear sector could cope with the world market demands. Exports of Indian leather footwear have been growing continuously since 1971-72 when it formed barely 5 per cent of total exports. In 1988-89, Rs 1,300 million worth of full shoes were exported

which constituted nearly 8 per cent of the total value of Indian leather exports

Global import of footwear components has shown a rising trend. During 1987, global import of prepared parts of footwear was estimated at \$ 1.46 billion of which India's share was nearly 17 per cent. The import of footwear components of which shoe uppers is the most important single item represents the last vestiges of a crumbling leather industry in the developed countries. As indicated earlier, India's component exports are made up largely of shoe uppers. Currently, more than a quarter of the total leather export earnings are from footwear components which is a remarkable increase from a mere 2 per cent in 1976-77.

Fashion trends, high comparative cost advantage between leather and high priced textile garments, easy to care nature of leather garments, and a natural appeal of leather have increased global preference for leather garments. Leather garments have come to be accepted more as utility wear in the developed economies on account of their ability to substitute textile apparel for reasons ranging from low temperatures to high incomes. Export of leather garments have made rapid progress especially over the last three years. In 1987, an estimated \$ 4.65 billion worth of leather garments were imported globally. The response of the Indian leather garment industry has been par-

ticularly encouraging. Till 1976-77, garments were a low priority item and comprised only 1 per cent of the total exports. Thereafter, it grew steadily and in 1985-86, India exported garments worth Rs 167 million (2.5 per cent of the total exports). With increasing incentives for the export of leather products, the succeeding year, 1986-87, saw a sudden spurt in leather garment exports which increased by more than 3.5 times to Rs 622 million and comprised almost 7 per cent of total leather exports.

But the biggest question before the sector is whether the growth is sustainable. Global trends indicate that demand for leather garments will remain high in the coming years. With a concomitant increase in indigenous manufacturing capacity, it seems likely that the Indian garment sector will be able to increase its share of the world market.

The global market for personal leather goods is presently dominated by south-east Asian countries. Indian manufactured leather goods face stiff competition from synthetics and Singapore. In 1985, exports from India comprised only 1.5 per cent of global imports. A significant proportion of this share is accounted for by ladies' hand bags alone. Further, even this marginal presence is confined to the low or lower medium market segments. India has a rather limited product range in the leather goods sector.

India has, however, retained a substantial market of saddlery and harness goods where Kanpur has traditional expertise.

IV

Factors Responsible for Export Performance

Arising from the above discussion and a dialogue with a cross section of leather manufacturer exporters, Table 8 summarises the factors responsible for the present state of the Indian leather industry and its export performance. Broadly, various aspects which impinge on the progress of the industry have been classified under three major groups—the industry's intrinsic nature, global competitiveness and government policy support. The positive features (or assets) and the bottlenecks (liabilities) of the Indian leather industry have been discussed in some detail in the previous sections. The present status of the industry (net worth) has resulted from the interplay of these assets and liabilities.

The net effect of this interplay, presented in Table 8, is not very encouraging. Low value realisation in international markets is related basically to the image of the industry as a manufacturer of cheap products reinforced by its generally poor average product quality. The government's realisation of the potential of the leather industry for increasing value addition within the economy led to the provision of liberal incentives for leather exports. As leather production is a low investment, high turnover activity, this lured many one-time leather workers or small leather traders to under-

TABLE 8 BALANCE SHEET OF INDIAN LEATHER INDUSTRY

| Group | Assets | Liabilities | Net Worth |
|--------------------|---|---|---|
| Intrinsic nature | Capital per unit labour of the product sector low | Mushroom growth of export units | |
| | Low capital investment relative to turn over in the product sector | Low level of mechanisation | |
| | Capital output ratio of the tanning sector lower than that of much Indian manufacturing | Absence of factory mode of production | Image in world market that of exporter of raw hides/skins or cheap products |
| Global competition | Low wage rate | Low productivity | |
| | Easy availability of raw material | Low recovery rate of hides and skins | Status of a jobber or fabricator |
| | Traditional skills | Latecomer in product manufacture and export and thus absence of brand image | Low value addition in products |
| Policy support | | Weak product components sector | Crucially dependent on imports of components for product manufacture |
| | Various export promotion incentives | Low unit value realisation | Product quality poor |
| | Import liberalisation | Anomalies persist in the import regime | Manufacturers adopt a satisfying approach |
| | | Little percolation of value addition to the village level making the collection and slaying activities uneconomic | |

take small-scale production for export. However, the entry of these new exporters has had a negative effect on India's export markets as, for many of them, the main motivation is to garner the export incentives and build up capital in the shortest possible time rather than to establish a lasting reputation in the export market. Specifically, the problem arises from

(1) Poor perceptions of quality—as such persons, without adequate exposure to developed country markets or the tastes and preferences of high income consumers, are unable to appreciate fully the need to improve quality and finish beyond a certain level

(2) Excessive competition—resulting in mutual price cutting (mostly amongst exporters based around Madras), and consequent compromises on quality features in order to ensure the highest possible return in the shortest possible time. The underlying economic insecurity of the average exporter is largely responsible for this

(3) Lack of interest in improving value addition in Indian leather product exports—as the system of low investment on high turnover (albeit at low margins) enables the exporter to operate at low risk and even more importantly, produce without any real knowledge of the market. The manufacturer remains a jobber receiving designs, components and, even production supervision from the foreign buyer

Such exporters are essentially economic agents rather than entrepreneurs with a long term perspective

To the extent that the better established exporters have tried to increase value addition by undertaking integrated production of final consumer or high quality intermediate products as well as by undertaking independent marketing (even in a few cases

to the extent of attempting to establish their own brand names) their efforts have been hampered by,

(1) the poor image of Indian products in the world market (to the extent that some importers in consuming countries are loath to reveal that their products are manufactured largely in India),

(2) the high level of investment in publicity and retailer support required to establish a brand name in a major market, and,

(3) the anomalous import regime which enables duty free imports of high quality finished leather for fulfilling export orders but imposes high import duties (in the 200 to 250 per cent range) on such items as chemicals, adhesives and polish required to obtain durability and sophisticated finishes as well as high duties on components (100 per cent) and synthetic soles (40 per cent)

Thus on the one hand, the discouraging returns to additional domestic processing have acted as a disincentive to established exporters undertaking substantial investments in brand promotion and domestic component production and on the other small manufacturer exporters with one wary eye on their past existence on the margins of economic respectability have shown scant respect for quality reputation or long term prospects in their attempts to earn a secure surplus in a relatively short period of time. It is only a few long established manufacturers in the industry (and a handful of new entrants with large amounts of capital) who are investing in new machinery and the creation of brand images in order to improve value addition despite the crippling effect of the industry's reputation and the apparently random obstacles still imposed by *ad hoc* deregulation

The case of footwear production provides numerous examples of such obstacles. Pro-

duction of footwear globally flourishes at the small-scale level, in India, however, the growth of the small-scale footwear manufacturing sector is seriously hampered by the lack of co-ordinated government policy:

(1) Imposition of excise duty on units with annual production value in excess of Rs 2 million is considered to be the key bottleneck. In a small mechanised unit, this turnover level is attained by production of 80 pairs a day (at the rate of an average price of say Rs 100 per pair for 250 working days). But no standard machine used for footwear manufacture has a capacity of less than 800 pairs a day. In effect, a mechanised unit is subjected to excise duty if it achieves more than 10 per cent capacity utilisation. The rigours of maintaining detailed records and appeasing excise inspectors further compound the problem. The measure is an important factor inhibiting mechanisation

(2) Exemption from excise duty is not permissible even to small units manufacturing a branded product. For instance, if a unit is producing footwear for Bata India, the former is not entitled to excise duty benefits.

(3) A seemingly irrational discrimination between production of footwear components and full shoes has retarded the growth of the footwear segment of the industry. Manufacture up to the shoe upper stage is not subject to excise duty but the moment a sole is attached to the upper, the unit invites a series of restrictions. This has prevented forward integration of the units. Knowledgeable sources within the industry feel that such a restriction has been of direct benefit to the declining leather industry in the developed countries which still retain a stranglehold over design, assembly and marketing of closed footwear

(4) The small manufacturer faces formidable, complex and unmanageable array of licences such as additional, advance, actual user, replenishment, special, etc. For instance, shoe laces and packing materials are only obtainable through a replenishment licence, trims and embellishments through an additional licence and activators and adhesives through a cumbersome procedure of special licence

(5) The licensing policy has not been in accordance with the requirements of the industry. Presently, footwear manufacture is reserved for the small scale, large units are permitted only under an export obligation. However, this has resulted in unnecessary fragmentation and multiplication of units which would run more efficiently if integrated

(6) A glaring anomaly in the import regime is that while most of the machines can be imported under CGL on easy terms, import of spare parts invites an exorbitant duty, sometimes even as high as 175 per cent. This has had two important implications. One, since the indigenous machine manufacturers could not compete with the imported machinery, India was unable to develop and strengthen its domestic machinery manufacturing capability. Two, the machines remain-

ed largely underutilised on account of difficulty in getting spare parts. Thus, while the organised sector acquired only an aura of mechanisation the foreign machine manufacturers reaped a rich harvest from the government's flawed policy.

(7) Value and percentage restrictions limiting the REP rates to export value prevented rapid growth of footwear and leather garment exports which require many more accessories than those listed. In the case of leather goods, half their value is determined by accessories. The value of these embellishments and trimmings is calculated including the air freight which limits the scope of imports. For example, import of zip and snap fasteners was, till recently⁶ limited to 2.5 per cent of the value of the licence and up to a maximum of Rs 50,000. But long zips are essential for boots and value restrictions and upper limits on imports only affected their liberal use in footwear.

The policy of granting liberal export incentives in an attempt to increase exports in the short term has tended to camouflage these systemic weaknesses in the promotional regime. There has been little emphasis on increasing domestic production of machinery and components required by the industry. India's production base has not expanded in proportion to its requirements and the bulk of the components have to be imported.

The net effect of this un-coordinated system has been to promote exports in the short term at the expense of establishing a long-term production base for the industry through the development of a strong production, capital goods and input supply infrastructure as well as design capabilities. Viewed in conjunction with the perception that the benefits of improved value addition have not percolated to the village level tanning and collection system, it is apparent that the opportunity of steady, long-term growth is being sacrificed in the frenzied pursuit of immediate foreign exchange earnings.

Appendix

Industrial change in India has been influenced strongly by government policy. The present process of deregulation and liberalisation in the leather industry is aimed at making leather manufactures globally competitive. The underlying objective is to incorporate the latest technological developments and respond to world market demand without sacrificing the twin aims of growth and self-reliance.

From the early 1970s, value addition to leather products before export has been the major objective. The Seetharamiah Committee, constituted in 1972, took advantage of global changes to make comprehensive recommendations for the future development of the leather and leather product industry. It recommended a ban on the export of raw hides and skins; quota restrictions on the export of semi-finished leather; a simultaneous increase in finished leather making capacity, and signi-

ficant incentives for increasing finished leather exports.

While the recommendations of the committee were implemented virtually completely, they did not always have the desired impact.

The next impetus in strengthening the industry's production base was provided by the Kaul Committee (1979). It realised that the country's vast raw material stock was insufficient by itself to promote manufacture of value added products. The committee recommended liberal capital goods imports to increase cost and quality competitiveness of Indian leather manufactures in the international market. Its most serious drawback, however, was the implicit assumption that the purchase of machinery *per se* would result in the mechanisation of the industry. On the contrary, freer import of machinery resulted in unutilised capacity and wastage.

The Pande Committee, constituted in 1985, made an integrated review of the industry and recommended a three-pronged approach for accelerating the pace of change and increasing the competitiveness of Indian leather products:

- (i) increase raw material availability;
- (ii) upgrade skills and modernise technology, and
- (iii) make footwear the most important single item of export.

The committee recognised the enormous potential of footwear production and suggested measures for the development of the industry.

The evolving regulatory framework has facilitated the transformation of a slow growing industry into a relatively fast growing export-oriented sector. The measures undertaken in recent years include, (i) liberalisation of capital goods imports and reduction of import duty; (ii) liberalisation of the industrial licensing policy to facilitate the entry of large industry; (iii) simplification of procedures for the import of components; (iv) rationalisation of export incentives, and (v) ensuring adequate capital flows to enable modernisation and skill upgradation.

- 2 Ideally, this analysis should be undertaken using a composite exchange rate index for all the major trading partners of the Indian leather industry. Such an analysis was undertaken in Sinha, Sanjay, 1982, 'India and the International Trade in Handknotted Carpets', *Economic and Political Weekly*, Volume XVII, No 48. Constraints of time and adequate data availability preclude such a detailed analysis here.
- 3 As consistent information on quantum of exports is not available, the use of constant rupees worth of exports here is a proxy for constant quantity. This is based on the assumption that if five square feet of leather cost Rs 100 in 1980-81 it would still cost Rs 100 in 1988-89. A more sophisticated analysis which would take account of changes in relative value was not possible in the course of this study.
- 4 Sahasranaman, A, 1989, 'Marketing of Readymades in the World Market in 1990s—Challenges before the Leather Industry', mimeo.
- 5 This applies particularly to the development of the trade in shoe uppers, garments and other leather goods in recent years.
- 6 The 1990 import export policy has removed some of these stifling restrictions but it will take a few years for the full benefit of the change to be realised.

ICES South Asian Dialogue Fellowships

The International Centre for Ethnic Studies, Kandy, Sri Lanka invites applications from Social Science Scholars (with Ph D) and Practitioners (Senior Journalists, Diplomats, Administrators, etc.) currently working in the SAARC region for ICES South Asian Dialogue Fellowships tenable in June-August 1992. Fellows will have an opportunity to travel in South Asia and also prepare a research paper that falls within the broad theme "The Process of Democratization in South Asia: Its Implications for Regional Political Stability and Peace". To obtain an application send a one page bio-data, and brief synopsis of your proposed research topic. Requests for application forms and other details accepted until September 30, 1991.

Applications close on October 31, 1991.

Director
International Centre for Ethnic Studies,
554/1 Peradeniya Road,

Benefit-Cost of Tehri Dam Project

A Review Analysis

B D Dhawan

The time has come to view power as an input with wider ramifications in the economy at large, and thus appraise power projects on the basis of marginal value product of power. In other words, such projects need be appraised within the framework of economic benefit-cost analysis similar to that used in the case of major irrigation projects as may be well-illustrated in the case of the Tehri project

THE Tehri dam project was conceived in 1949, and detailed investigations were carried out in 1963. As the parameters of the project have undergone change, we must be clear about the version being reviewed here.¹ It is the one evaluated by INTACH and authored by Vijay Paranjpye, an economist better known in environmental activist circles as well as to the print media. The focus of the review is on the sub title of the INTACH study *Evaluating the Tehri Dam: An Extended Cost Benefit Appraisal* as finally published in 1989. The review takes note of only one serious review of this study by Kanchan Chopra, my colleague, which she prepared for the dam book edited by me [Dhawan 1990].

RESUME OF PROJECT COST AND RETURNS

As per the project planners' report, the Tehri project is a Rs 1475 crore investment proposal. From its Stage I installed generating capacity of 1000 MW (1000 MW more to be added in Stage II) about 3000 million kWh of hydel power would be available per year, much of it to cater to the peak load demand in UP. The annual working expenses are placed at about Rs 25 crore. Besides hydel power, the project would improve on farm income on about 0.6 million ha of area already irrigated by the Ganga canal system, as also bring 0.27 million ha additional area under irrigation in the same canal system. The important point to note here is that newly irrigated area is mostly rabi area when arable land is likely to remain fallow in the absence of irrigation in the semi arid plains of western UP.

The project report expects a net revenue of about Rs 124 crore per annum from the sale of power. While this constitutes 11.59 per cent on the capital share of the power segment of the project, an important point to note is that it accrues to the state department under whose aegis the project comes up. A BC ratio of 3.49 for the irrigation segment is mentioned. The value of increased farmers' income from

the Tehri waters is placed at Rs 158 crore or thereabouts, accruing wholly to farmers and not to the project authority. No wonder then these two components of benefits from the project, lacking additivity as they do, are not combined into a single measure in the project report.

In short, the project meets the central planners' rate of return criterion for power projects (above 10 per cent) as well as the benefit cost ratio criterion for major irrigation projects (above 1.50).

Paranjpye utilises pertinent and not so pertinent arguments as well as data base, questions the aforesaid estimates of costs, returns, benefit cost ratios, etc. He basically raises the capital costs of the project on the one hand and drastically lowers the benefits from irrigation on the other. As a result, the viability of the project vanishes on both counts: the rate of return on capital in the case of the power segment gets diminished to about 6.89 per cent, and the BC ratio for irrigation segment comes down to 1.28. In fact, he combines the two disparate components of returns from the Tehri project into one and concludes that the BC ratio for the whole project is only 0.56. (He claims on p.133 that a BC ratio of about 4.8 is mentioned for the project in an affidavit by the state of UP in the Supreme Court.)

More specifically, his major revised estimates are as follows. First he finds that the investment cost of the project is about Rs 1740 crore, about 18 per cent above the project estimate. Truly damaging to the Tehri project planners' case is his attempt to assess the net cost on investments during the 15 year gestation period (reckoned at 12 per cent per annum on a compounding basis). As he capitalises these interest charges, the capital cost of the project shoots up to nearly Rs 3023 crore (four fifths more than Rs 1740 crore investment outlay).

On the benefit side, he leaves intact gross revenue figure from sale of power but enhances the working expenses. Thus

the net revenue from power diminishes marginally (by 2 per cent only). However, he brings down the benefits from irrigation to Rs 65 crore, a reduction of the order of Rs 93 crore.

Kanchan Chopra while leaving untouched Paranjpye's estimate of income benefits from irrigation, concentrated *inter alia* on his estimate of benefits from hydel power. Throwing overboard his arguments, which are very weak indeed, she proceeds to revalue hydel power at 82 instead of 48 paise per kWh. This higher price is the resources cost of generating thermal power in UP, an alternative to hydel power development in the state. But departing from Paranjpye's rather traditional or a bit outdated procedure of computing undiscounted benefit cost ratio, she does a standard BC analysis in which a discounted BC ratio as well as an estimate of internal rate of return (IRR) is obtained. In her words, "we did our own calculations using UNIDO methodology and social prices obtained by giving distribution weights to different commodities and to different category of consumers".² [Chopra 1990, p.189]. So, her BC ratio comes to 0.87⁴ but with an IRR of 10.38 per cent and Paranjpye's conclusion of unviability of the project remains undisturbed.

A CRITIQUE

Professionally, I have been time and again raising the unconventional viewpoint that benefit cost analysis is essentially speculative in character, notwithstanding the valiant efforts of economic theories to minimise the speculative element. The room for speculation rises manifold when an evaluator or BC analyst is motivated one way or the other. While project promoters are known to oversell a project by underplaying project costs and overplaying its benefit side, economists tend to be conservative in this area, that is, they tend to overdo on the cost side and underplay the benefits. If Tehri dam project promoters can be charged with selling an unviable project to the centre, Paranjpye cannot escape a like charge in the reverse that is killing probably a viable project as shown below. My critique centres round (a) a close look at the on farm benefits of irrigation, (b) methodology of BC analysis, and (c) the problem of valuation of benefits from hydel power. I shall begin with point (c) first.

Paranjpye has goofed up in utilising the economic theory of pricing on the one hand and showing little understanding of the demand for electricity in the economy of Uttar Pradesh on the other. While under monopoly conditions a firm can overprice its product, over and above its

resource cost, a public utility is prevented from doing so. This is true the world over. Underpricing of power and irrigation in India is well recognised, and the State Electricity Board of Uttar Pradesh is no exception in this matter. In fact, Paranjpye's own calculation for Tehri power is that it would cost 73 paise per KWh in generation alone (p 65, item 6 in the tabular data) whereas it would be sold only at 48 paise per KWh. How then can he make the following preposterous statement: "Since the government is in the position of a monopoly producer, it has been passing on the higher costs of generation to the consumer, unilaterally raising prices" (p 63, 3rd para).

As regards his understanding of the power position in UP, the less said the better. Blithely forgetting the distinction between 'demand for a good' and 'actual consumption of that good' (the latter is less than the former in a regime of scarcity), he unwarrantedly makes the following observations:

We also feel that the energy forecasts provided by the authorities to justify the need for building a peak station are overestimates. For instance, in 1983-84 9.642 million units of energy were consumed in UP when the actual production was 11.6832 million units. But in 1985-86 the authorities expect that the demand will be 21.369 million units. These estimates further assume that demand for energy will grow at a rate of 9 per cent per annum whereas the demand has grown only at 4.8 per cent per annum between 1973-74 and 1983-84 (emphasis added, p 64).

When power is in short supply (and when it is underpriced also), the hiatus between actual consumption and demand is bound to be wide. Therefore, the rate of growth of actual consumption of power is no measure of likely rate of growth in demand for power. Knowing as I do know how power shortages have been hampering tubewell irrigation both within private and public aegis in UP, I am really astounded by Paranjpye's perceptions on power needs. There has been a veritable explosion in tubewell irrigation in the state: the number of shallow private tubewells rose from 3,000 in 1950-51 to 3,53,000 in 1973-74, 15,86,000 in 1984-85, and nearly 24,00,000 in 1989-90. It is because of power shortage that farmers had to opt for diesel pumpsets, whose number in 1989-90 was nearly 19,00,000 as compared to only about 600 electric pumpsets.

Even so, the consumption of power in state's agriculture sector in 1986-87 stood at 99.75 GWH (average price realised - 27 paise/KWh), constituting 37 per cent of the total state consumption of power⁵. The power shortages however, prevented electric tubewell owners from undertaking the needed irrigation⁶. For example, a survey of 230 electric tubewells in 1983-84 showed that their owners could not irrigate their main crops of wheat, sugar

cane and paddy up to the levels recommended by farm scientists (see the table for details).

As regards Chopra's valuation of hydro power at the resource cost of thermal power, it makes sense in the context of cost effectiveness, that is, while making a choice among techniques of production with the tacit assumption that product remains the same (or exact substitute) in each technique. That is not so in the present case as hydel power stations (backed with storage reservoirs) are well suited to meeting peak power loads in power system. For this reason, such flexible power needs to be given a higher price tag than thermal power where the average (unit) cost of power generation becomes lower only because of high rate of capacity utilisation (i.e., 'plant factor') due to the use of thermal stations for meeting the base load of a power system.

The time has come to evaluate power projects with fuller economic cost-benefit criteria. Such a change in criteria from rate of return criterion to cost-benefit criterion has already taken place in the case of irrigation projects after independence. This transition was commended by the veteran economist D.R. Gadgil, a pioneer in evaluating major irrigation works in India. In fact, this approach is relevant for all public investment proposals where benefits to the economy at large far exceed the departmental net returns on such investment. I think that electric power is in that class. As an infrastructural service par excellence, projects providing power need to be appraised by pricing power at its marginal value product in the economy. This value today in UP is far more than 82 paise/KWh.

My second major comment pertains to Paranjpye's remeasurement of irrigation benefits, an area of central concern in my research work of nearly last two decades. Since I have been writing for long that such benefits have been underassessed in the Indian benefit-cost exercises, I am therefore, impelled to look closely (and harshly) at his substantial downward revision of the Tehri project planners' estimate in this regard. I find that instead of revising the benefits downwards, he ought to have enhanced them upwards. I do not wish to bore readers with the tedious

calculus in this regard. Here, I present the thrust of my two-fold argument. The first is about the direct output impact of any source of irrigation. In working out this impact (and the resultant income and employment effects), a simple differencing of irrigated and unirrigated yield data would understate the output augmenting role of irrigation [Dhawan 1988, chapter 3]. To avoid this underassessment, I have suggested one summary procedure and one season-by-season measurement. In the latter procedure, one computes the output augmentation separately for each crop season (kharif crops, rabi crops and summer crops) and then add them up. In the summary procedure, one uses the seasonal orientation of an irrigation source to measure the excess of aggregate irrigated yield over aggregate rainfed (unirrigated) yield. If 'K' stands for the proportion of crop area under kharif irrigation, the yield impact (from the viewpoint of output augmentation) $Y_i - K Y_u$, where Y_i and Y_u stand for aggregate irrigated and unirrigated yield, respectively 'K' for the 0.27 million ha additional irrigated area for Tehri dam project is nearer zero (0.08 to be precise) because only 0.021 million ha out of total 0.27 million ha of additional irrigation is from kharif sugarcane. Thus the Tehri project planners are justified in assuming that the entire additional net output/income from 0.27 million ha area (placed at Rs 64 crore *vide* statements 1 and 2 of Table IV on p 83) is additional benefit from the project. Therefore, Paranjpye's contention that it should be reduced by the estimated value of about Rs 44 crore (*vide* calculus shown on p 78) presently realised from 0.27 million ha is invalid⁷. With this modification alone, the irrigation benefits as estimated by Paranjpye would move back to about Rs 109 crore.

The second aspect of my argument pertains to indirect output impact of canal waters through substantial increase in groundwater recharge that sustains more of groundwater-based agriculture in low rainfall regions having naturally poor groundwater availability. As this indirect output impact can be as much as the direct output impact [Dhawan 1989, chapters 6, 7 and 9], the true on-farm income benefits can be twice as much as the

TABLE CROPSWISE AND REGIONWISE NUMBER OF WATERINGS BY PRIVATE TUBEWELL OWNERS IN UP, 1982-83

| S. Crop No. | Recommended No. of Waterings | Actual No. of Waterings | | |
|------------------|------------------------------|-------------------------|---------|------------|
| | | West UP | East UP | Central UP |
| 1. Wheat | 5 | 1.66 | 3.27 | 3.47 |
| 2. Paddy | 5 | 3.00 | 2.64 | 2.54 |
| 3. Sugarcane | 7 | 4.62 | 3.53 | 3.96 |
| 4. Maize | 3 | 1.77 | 1.33 | 1.25 |
| 5. Others | 1.25 | 1.25 | 1.10 | 1.20 |
| Weighted average | — | 2.93 | 2.76 | 2.64 |

Source: Dhawan [1989, p 54]

direct ones. Since the western UP area to be served by the Tehri project is a low rainfall area with poor groundwater recharge from rainfall infiltration, it would be defensible to raise *ceteris paribus* the on-farm income benefits of the project to a level of about Rs 200 crore (Rs 43 crore above the level estimated in the project report, and Rs 136 crore above the level measured by Paranjpye).

Finally, I would like to comment on the improved methodology employed by Paranjpye. One cannot fault him with his attempt to reckon with interest charges of the project gestation period. Despite his use of annuity approach to annualise capital costs, he remains within the traditional domain of undiscounted BC analysis. A major lament of the Indian economists (since the publication of the Indian Irrigation Commission's report in 1972) against the government BC analysis has been its undiscounted nature, whereby the stream of future incomes after project completion and the stream of incurred costs of the project gestation period are not brought to comparable present values or worth. In an undiscounted analysis, the annual value of the incomes from a project is simply divided by annual costs (one-shot capital outlay is annualised by applying an interest rate plus a depreciation rate, and this 'fixed cost' is then added to working/recurring expenses per annum), so as to obtain a BC ratio which is then adjudged against a cut off value (e.g. 1.5 is now the cut-off value for major and medium irrigation projects in India). Had discounting been done and the present value of income benefits divided by the present value of project costs, the BC ratio so obtained would be adjudged or appraised against unity. Thus, it is clear that an undiscounted BC ratio, when appraised against a value set above one (e.g. 1.5 for major irrigation projects), is not all that improper. The procedure implicitly recognises (a) the quick and easy manner in which undiscounted *vis-a-vis* discounted BC ratio is worked out, and (b) the time lag between the two streams of costs and benefits.⁹ Now that computer facilities are available rather readily and pervasively, prudence should prevail over pragmatism, that is to say, discounted BC ratio be computed—this obviates the need for any cut-off norms against which BC ratio is to be appraised.

SUMMARY

INTACH evaluation report by Vijay Paranjpye is rather faulty. He comes out with an (undiscounted) BC ratio of only 0.56, indicating negative returns from the investment in the Tehri dam project. His separate evaluation for the power and irrigation components reveals (a) a rate of return (RR) of 6.89 per cent on investment in power segment as against 11.59 per cent anticipated in the Tehri project report, and (b) a BC ratio of 1.28 as against the anti-

ipated value of 3.49 (revised to 4.8 in an affidavit filed in the Supreme Court). Evidently, both the BC ratio and the RR are below the planners' criteria for major irrigation works (undiscounted BC ratio of at least 1.5) and power projects (RR of at least 10 per cent) in the case of Paranjpye evaluation.

Kanchan Chopra's reassessment of the value of power benefits from the project at 82 instead of 48 paise/KWh gives a discounted BC ratio of 0.87, with internal rate of return (IRR) of the order of 10 per cent. She uses the improved UNIDO methodology, wherein due distributional weights are assigned to different beneficiaries of a project. She has, however, undervalued hydel power by valuing it at the resource cost of thermal generation.

Time has come to view power as an input with wider ramifications in the economy at large and thus appraise power projects on the basis of marginal value product of power. In other words, such projects need be appraised within the framework of economic benefit-cost analysis similar to that used in the case of major irrigation projects.

Irrigation benefits from Tehri project, according to this author, have been unwarrantedly scaled down by Paranjpye in his cumbersome exercise in re-evaluation. These are, in fact, not fully measured even in the Tehri dam report. A common error in cost benefit analysis in India has been to ignore tremendous increase in groundwater-based farm output due to seeped-in canal waters in low rainfall tracts.

The doubt cast on the economic viability of the Tehri project by Paranjpye is not well founded in facts. How far rise in project costs—because of modifications in the dam structure so as to insulate effectively the dam against seismic hazard—might make the project uneconomic is still unexplored. If such insulation cannot be achieved, the project becomes unviable, technically and not economically.

Notes

[Based on paper presented for the Seminar on Social Cost Benefit of Hydro Electric Projects in Hills, held during May 7 to 9 1991 under HIPA auspices at Shimla.]

1 At the very outset two things need to be stated. First, the case chosen here is a multipurpose project, yielding benefits both in the shape of hydel power and irrigation. Yet, it is widely viewed as a hydel project because it is primarily conceived as a power augmenting scheme (an analogy in the reverse is the multipurpose Bhakra Nangal project planned primarily for irrigation augmentation). Second, it is not my objective to pass here any final verdict on this highly controversial big dam project. That verdict cannot rest solely on benefit-cost ratio of the project, however sophisticated may be the BC analysis. On the one hand, the seismic hazard posed by this project needs fuller investigation by technical experts. If either by thickening the base width of the dam (as per the Russian advice), or

by lowering the height of the dam, the seismic hazard could be brought within acceptable limits, the benefit-cost ratio has to be reworked with enhanced costs/reduced benefits.

- 2 This percentage is thrice mentioned on pages 42, 65 and 137. Yet, something is amiss with it, because the underlying exercise data on p 65 would suggest a rate of 9.59 per cent (Rs 12,121.81 lakh as per cent of Rs 1,26,431.34 lakh).
- 3 Power is given a weight of 1.2 as it is in short supply in the economy. Further, consumers of power are given a weight of 0.8 and of irrigation water a weight of 1.2.
- 4 If we were to work this ratio by the methodology of Paranjpye (without distributional weights), the BC ratio would be 0.83 when power is priced at 82 paise/KWh.
- 5 Power consumers in other sectors of the economy know too well how power needs of agriculture sector come to acquire priority at sowing and maturing stages of crops, thereby leading to a spillover effect of power shortages in agriculture.
- 6 In a flat, horse power-linked tariff, tubewell owners are expected to cross the level of recommended waterings for crops like sugarcane and paddy.
- 7 Here I am reminded of K N Raj (of Delhi School of Economics and associated with the formulation of the First Five-Year Plan) questioning the investment in Bhakra Nangal as he could not foresee the value of its huge power output for the economy of Punjab—the state has been experiencing power shortages since the green revolution.
- 8 Paranjpye does not realise that his method of estimating this number is grossly in error. He has assumed it to be 44.7 per cent of Rs 9829.28, the estimated value of net income from 6.04 lakh ha of already irrigated land. And 2.7 lakh ha is exactly 44.7 per cent of 6.04 lakh ha. By this method, he is assuming that each unirrigated ha gives an income of Rs 1,627, which is too high (for an irrigated ha his figure averages only Rs 2,387).
- 9 A measure similar to simple RR (rate of return) on investment in an industry is the IRR which duly takes care of this time lag. A simple RR is net revenue as a per cent of capital outlay or investment. Net revenue is the excess of annual gross revenue over annual working costs plus depreciation charge. It can be shown that larger the time lag, the higher is RR over IRR [Dhawan, 1982].

State and Industry

Suma S Athreye

The Political Economy of Indian Sugar: State Intervention and Structural Change by Sanjaya Baru, Oxford University Press, Delhi, 1990, pp 225, Rs 175.

DETAILED industry studies, examining aspects of policy and the pattern of growth, are always of interest to researchers and students. This is because such studies demonstrate the significance of industry specific factors, and the often complex interaction between these and elements of policy. The pattern and problems of growth can then be seen as a fall-out of this interaction. Sanjaya Baru's book is a valuable study for this reason. Its attempt is 'to examine the contemporary economic and technical problems facing the [sugar] industry, in the context of its history and the extant social and political milieu in which such problems have to be resolved'.

The first three chapters of the book therefore, are concerned with tracing aspects of the evolution of the sugar industry in the colonial period. Following the imposition of prohibitive tariffs in 1932 ostensibly to "promote the cultivators of sugarcane" the growth of the sugar (milling) industry was slow. The poor quality of sugarcane, irregularity of cane supply and the poor recovery of sugar from cane (both due to poor machinery and quality of cane) were the main obstructing factors. State policy towards the industry had two main elements viz, the imposition of import duties on foreign sugar and minimum pricing policies for the benefit of the growers of sugarcane. Improvement of cane varieties through the ICAR was also attempted.

The initial growth of the industry was concentrated regionally in the areas of Uttar Pradesh and Bihar. The interests of these firms were represented in the Indian Sugar Mills Association (ISMA). The spread of irrigation, encouraged the emergence of lower cost sugar mills in the Deccan. The interests of the 'older' Uttar Pradesh and Bihar firms were severely threatened by the manufacturers from the Deccan. Alarmed by this and by falling sugar prices, members of ISMA sought to stabilise prices and protect market shares through the formations of a cartel. The Indian Sugar Syndicate was formed in 1937 and recognised by the government. This policy of freezing market shares was of course opposed by the more competitive mills of the south. The rapid escalation of sugar prices and the presence of firms who could under-cut prices outside the cartel ultimately led to the disbanding of the Syndicate.

Another arena of growing conflict that was between the miller and the grower. As peasants started becoming more vocal and unrests acquired political backing some concessions had to be made, and minimum prices for sugarcane fixed with reference to recovery levels was one of them. Conflict between grower and miller interests were more a feature of the northern mills who encountered a given production structure of sugarcane unlike that of mills in the Deccan. Large mills in the Deccan had their own sugarcane farms and later with the growth of co-operatives the distinction between miller and grower collapsed completely.

The rest of the book chapters IV to IX looks at the policies toward the sugar industry in the post independence period and the associated structural changes in the industry. The main elements of state policy toward the industry were:

- (i) conscious encouragement of cheaper mills in the Deccan in the co-operative sector through licensing policy
- (ii) modernisation and rehabilitation of the existing private sector
- (iii) creation of procurement zones to insure regular cane supply for millers combined with a minimum price assured to growers of sugarcane and
- (iv) price and distribution controls over sugar.

There were elements of chance and continuity. Further expansion of the industry was decided in favour of the co-operatives in the Deccan. The rich farmer interests that ultimately dominated co-operatives found political power and patronage by their support of the national movement. Greater attention was paid to cane grower farmer interests. Undoubtedly they were the consequence of a changed political milieu. The syndicate of 1937 was replaced by government controls over price and distribution of sugar. The older inefficient firms were protected and forced to modernise.

The impact of this had been to bring about some structural changes in the industry. Principally Baru isolates three structural changes:

- (i) a change in the location from Uttar Pradesh, Bihar to the Deccan states of Maharashtra, Andhra Pradesh and Karnataka,
- (ii) a change in the pattern of ownership

with co-operatives becoming more important, and

- (iii) an increase in the number of large mills and a decline in the numbers of smaller mills.

While (i) and (ii) may be understood as a direct consequence of state policy, the third change is not so easily understood. This forms the point of departure for an extremely interesting discussion on scale, profitability and diversification in chapter V. Though an inverse relation between size and unit cost is evidenced by cross sectional data, the largest number of mills is in the middle and not the large capacity category. The reason why potential economies of scale are not actually reaped by most firms in the industry is overcrowding (due to the absence of barriers to entry) which tends to increase the duration gap between cane supply and processing. The larger the duration gap, the greater the drudge of cane, the lower the recovery percentage and the higher the actual unit costs.

Location also appears to be important in explaining costs. Even large scale mills have high costs in Uttar Pradesh and Bihar. This is because mills in these regions face a cane supply environment which is pre-determined in terms of quality and structure. This is unlike the co-operatives in Maharashtra, where sugarcane farms are set up to supply cane to the mills.

Because an upper limit to profitability ultimately gets determined by cane supply conditions and price controls effectively restrict the firms' ability to prevent an erosion of their profitability. Diversification is common to all the firms in the industry. The compulsion to diversify for firms from Uttar Pradesh and Bihar came from the direct threat to them from the cheaper Deccan manufacturers. Here the discussion of diversification on the part of the newer firms from Maharashtra, Karnataka and Andhra Pradesh is somewhat brief and summary and leaves the reader with a sense of wanting more.

The discussion on co-operatives and private mills is interesting and informative. Mills in Uttar Pradesh and Bihar are largely private sector mills and the Deccan states of Maharashtra, Andhra Pradesh and Karnataka have several successful co-operatives. However, in these Deccan states there are also a sizeable number of private sector mills. Is there any difference in the performance of private sector mills in these regions? Why/why not? A major factor in the success of co-operatives has been the absence of the uncertainties that the miller-grower disjunction poses. But this is not necessarily true for all the private mills in these Deccan states. Further, some data

which compares the performance of private and co-operative sector in the major sugar producing states revealed better capacity utilisation by the private sector in Andhra Pradesh, Tamil Nadu and Uttar Pradesh. However, in Karnataka and Maharashtra the co-operatives showed better capacity utilisation*. Pursuit of some of these questions may yield useful insights.

Only one aspect of technical change in this industry, viz, the growth of efficient large-scale plants and modernisation of plant and machinery is discussed. The compulsion to modernisation and therefore technological change came about as a consequence of state intervention rather than in the absence of it. But the discussion on economies of scale suggests several interesting questions for technological change in the industry. Given that economies of scale are not always actually realised, is there a tendency or attempt to de-scale technology in sugar machinery? With price controls profitability may increase with better recovery. How has the industry responded to this? Perhaps all this is not really within the focus of the study, viz state intervention and structural change. Nevertheless they are suggested by the preceding discussions.

Chapters VII and VIII focus specifically on pricing policies towards sugar and sugarcane. Prices of gur set the notional floor to sugarcane prices and those offered by the co-operative sector the ceiling. Private mills usually pay the statutory minimum price which lies between the two. The principal preoccupations of sugarcane pricing policy have been to maintain the balance between grower and miller interests and secondly to provide incentives for improvements in cane quality. The latter has been inadequately fulfilled.

In years of excess demand prices offered by the gur manufacturers for sugarcane go up and sugar millers are unable to attract cane supplies because of controls over sugar prices. Why control sugar price at all? Baru argues that the demand for sugar emanates principally from urban and semi-urban areas. In periods of excess demand for sugar (and therefore sugarcane), state intervention is necessitated by the demands of the consumer, in order to prevent prices from rising. In periods of excess supply to prevent a slump, producers of sugarcane and sugar demand state intervention. Full control of prices would necessitate buffer stocking and export operations of large magnitudes. A system of partial decontrol with a two-tier system of pricing (levy and free market) is therefore preferred.

The last chapter of the book is perhaps the most interesting, as it discusses the various hypotheses about output fluctua-

tions that are a characteristic of the sugar industry. These have often been accompanied by instability in the acreage under sugarcane. 'Cobweb' type explanations which try to relate acreage shifts to fluctuations in sugar and sugarcane prices and ultimately to sugar production have been offered earlier. Baru however modifies these earlier arguments to account for the limits imposed by and on state intervention. Both sugar and cane prices have a fixed and a flexible element. The fixed element is not sensitive to excess demand or supply conditions and while the spot flex price does adjust it may induce an output decision that may not be cleared in the market at the

future price level. This is the source of instability. Structural factors such as the downward rigidity of fix prices may transmit the wrong signals and precipitate crises. Though state intervention can avert such crises, there are limits to it and in any case market uncertainties cannot be completely eliminated. The historical and structural specificity of this explanation is stressed.

All in all, the book is well written and lucid. It is also a good example of the usefulness of the method of political economy in the study of industry and, unlike several other industry studies, it is almost never a boring collation of facts. Students of industry should find it extremely useful.

Prejudiced View of Fiji

Anirudha Gupta

Fiji. A Paradise in Peril by Pran Nath Seth, Sterling Publishers, New Delhi, 1991, pp 168, Rs 150

IN addition to being clannish, do Indians overseas exhibit a trait of ethnic superiority towards peoples of other races and cultures?

A difficult question. But Ahmed Ali, who served as a minister in Sir Ratu Mara's Alliance Party government, is unequivocal in his answer. He points out that the first Indians who arrived in Fiji as indentured labourers or 'mitiva' were extra careful in keeping their distance from the indigenous people. They referred to Fijians as cannibals or 'jungalees' (both derogatory terms) which in Ali's view reflected a typically arrogant attitude of one cultural group towards another based on ignorance and prejudice. Fijian responses were hostile. [Ahmed Ali 1986]

Pran Nath Seth, author of the book under review, has little patience with such lines of argument. In his opinion all of the 60,000 Indians who came to work on Fiji's sugar plantations were paragons of virtue. In three generations' runs his Preface, they changed the face of their adopted country from a community of tribes constantly fighting with each other to a land of plenty. These Indians 'created new wealth where none existed'. In short they saved the Fijians 'from extermination and exploitation by the European settlers' (p 20).

What about the Fijians? Compared to the Indians, why did they not do so well in their own country? Because, says Seth, they 'did not have the aptitude or perhaps the capacity for hard work' (p 127). They were originally—here the author quotes some early missionaries—"treacherous cannibals" who offered feasts of human flesh on every important religious and social occasions (he gives the recipe as well!), and when Fijian warriors returned from coastal raids, their war canoes had "children hung by their feet or hands from the sails as a symbol of victory over their enemies" (p 5).

Among these 'savages' Indians lived and by their 'hard work and dedication' produced new wealth where none existed. But they faced racial discrimination. First, the Fijians refused to part with their land which Indians cultivated on short leases. This was nothing very unique: the colonial administration in Kenya debarred Indian settlers from owning land. But Seth is inconsolable. Time and again he returns to the theme. More than 80 per cent of the sugar farming was in Indian hands but they had no right to own the land, 83 per cent of which was not alienable. They were given short leases of 10 years which kept them insecure (p 53).

The Indians were also politically discriminated but when they made good to form a coalition government with Timothy Bavadras' Labour Party, the army intervened and upset their gains. This, concludes Seth, is blatant racism. 'The present rulers of Fiji', he laments, 'want all key positions in Fiji including president, prime minister, home minister as well as army chief and the police chief to be exclusively earmarked for ethnic Fijians. In the Lower House, they want dominant majority (70 per cent) and in the Upper House complete control of the Fijians, reducing the status of Indians to second class citizens—a new type of apartheid—racial discrimination as bad as in South Africa' (Preface, p xi).

This makes up a formidable charge sheet, but Seth—a pity!—gets some of his facts wrong. First, the post-coup civilian government of Ratu Mara (as constituted on December 5, 1987) includes two Indian ministers, second, Indian judges, editors and professionals continue in their jobs as do the shopkeepers and farmers, third, no Indian can be army or police chief because Indians voluntarily refused to enlist in these services so that "Fijian youths had military role

* See M Y Khan, 'Physical Performance of the Sugar Industry', *RBI Occasional Papers*, 1988, Volume 9, Number 1.

models for their consideration whereas Indians did not", (Saffu 1990) and, last, the Fijian upper house has always been under complete control of the islands' paramount chiefs

The charge that Fiji is creating a new type of apartheid—"as bad as in South Africa"—is absurd because South Africa till date does not give franchise to black Africans whereas Indians can become ministers in Fiji

Seth's utterly prejudiced version of the Fijian paradise being in peril would not have occasioned further review but for the fact that it mirrors closely the official mind of India. Like him the Brahmins in New Delhi's South Block rushed to interpret the post coup events in Suva in purely racist terms viz, Indians versus Fijians. They raved about "institutionalised racial discrimination" without even once enquiring how Sitiveni Rabuka's coup affected different sections of the Fijians. Were all Fijians happy? Who gained, who lost? The government of India called for the restoration of the 1970 Constitution which in fact institutionalised racial franchise in Fiji. It contained, observes a scholar of Papua New Guinea, "undemocratic and illiberal provisions such as communal electoral rolls, unequal communal representation, entrenched chiefly dominated institutions and provisions protecting pre-democratic customs, customary rights and land" (Saffu 1990)

In 1970 Indians in Fiji opposed these provisions, in 1987 the government of India held them indispensable for the restoration of democracy. Must it learn nothing from history? But it fouled the present as well when in an inebriated pursuit of active diplomacy, special envoys of the prime minister flew to London, Canberra and Wellington to energise them into taking punitive action against Suva. For the first time, claims Seth, India stood solidly by an overseas Indian community without censure or apology. A new policy towards overseas Indians was born on account of the Fiji crisis' (p. 155)

But even Seth admits that, for all practical purposes, Fiji represents a colony of Australia and thrives on Australian and New Zealand imports. Besides these two countries, there are about 50 companies operating in Fiji which are registered in UK and seven other countries. Would they have paid any heed to India's plea? Even the Vancouver Summit of the Commonwealth (October 13-17, 1987) failed to buy the Indian version that Suva was practising racial discrimination. It agreed, however, to lapse Fiji's membership on the technical ground that as a republic it should reapply for membership.

The two coups of 1987 were not particularly aimed against the Indo-Fijians though Rabuka and the men behind him purposefully drew attention to the so-called 'Indian threat' in order partly to appeal to

Fijian ethnic sentiments and partly—or perhaps more importantly—to cover the real motives behind their action. Both aspects require some elaboration. It cannot be disputed that the predominance of Indians in Bavadra's cabinet (7/5) generated great uneasiness among the Fijians. Given the communal composition of franchise, this reaction was not unnatural. Besides, notes an anthropologist, Caroline Henning Brown, there existed a 'balance of power' philosophy in Fiji that the Indians run the economy and the Fijians run the government, and the possibility of an Indian dominated government has always carried with it the implication of destabilising this balance. The Fijians viewed this 'disbalance' with alarm. Their immediate fear was that an Indian led government would somehow manage to transfer their ancestral land to the Indian farmers, which is precisely what the National Federation Party (NFP) of well-to-do Indian farmers and businessmen had all along wanted. The defeated leaders of the Alliance Party and their new converts in the extremist 'louker' movement fully exploited the situation. Without the Alliance Party and the defeated leaders, Fijians will never lead the country again. A colourful politician, Apisai Iora, and an Australian employee of the Gold Mine Company, Jeffrey Reed, combined their money, in skill, with local effect and the villagers of Tavua were out on the road to protest against the formation of Indian government' (p. 75)

Yet it was not the Indian factor but the total collapse of Alliance politics which revolved on a nexus of Fijian aristocratic families, foreign companies and corrupt politicians that prompted Rabuka's coup.

A wrong civilian group had gained power. Its policies might hurt (would hurt) a Fijian as Rabuka was concerned) the aristocracy and the traditional power structure which Alliance Party rule had safeguarded. (Saffu 1990)

The loss of power to a 'wrong' civilian group threatened to ruin the leading aristocratic families of eastern Fiji. The extent of their sway over Fiji in politics can be gleaned from the following: the paramount chief of the Lau group of islands, Ratu Sir Kamisese Mara, was prime minister and leader of the ruling Alliance Party. The paramount chief of Rewa based confederacy is his wife. The former governor general and now president, Ratu Sir Penaia Ganilau, has been Iui Cakau and head of the Tovata confederacy since 1987. The first governor general, Ratu Sir George Cakobau, was Iui Viti, the premier aristocrat in Fiji and head of the Kabuna confederacy.

The possibility that they could be politically dislodged, not by a bunch of opportunist Indian politicians but a determined group of commoners composing Bavadra's Labour Party that drove these families to extreme desperation. They could not have

retrieved the situation by normal political means, hence they turned to the army for intervention. On their own, men of the Royal Fiji Military Forces (RFMF) had no specific grievance either against Bavadra's regime or Indians, but their commanding officers had close relations with the aggrieved chiefly families. The army commander at the time of Rabuka's May coup, brigadier Ratu Nailatikau, was also son in law of Ratu Mara. Ratu Sir Penaia has a son in the army who is married to Ratu Mara's daughter, Major Isirih Dugu, one of the key men in the coup, is the son in law of the late Tui Cakau. In a significant number of cases, bonds of blood and marriage provided the sinews, the commonality of interest and the harmony of outlooks between RFMF officers and traditional aristocracy. Hence, although a commoner, Sitiveni Rabuka is on his own admission, more royalist than the royals. He has been a protégé of Ratu Sir Penaia and plays golf with Ratu Sir Kamisese' (Saffu 1990)

The Fijian coup was thus a rear guard operation on the part of eastern based chiefs and army officers to restore the *status quo ante*. There may have been certain auxiliary considerations, e.g. panic among Alliance politicians that Bavadra's government might institute enquiries into their corrupt deals and Rabuka's psychological compulsion that he would be court-martialled for insubordination. There was also a lurking fear that the special advantages of the eastern chiefs would be seized by a rival, western based confederacy.

In all this, Indians played little role. Their party, the NFP, was ethnicity based as was the Alliance Party. And, with the exception of a few intellectual, prosperous Indian farmers and businessmen, were least interested in the lives of Fijian poor. They sent their savings and children abroad and, at the first sign of trouble—fled the country. Among the 30,000 Indians who lined up before the Indian mission in Suva to obtain visas for other countries, none—repeat, none thought of bringing back his or her new wealth to the country of origin. But they all clamoured for India's help on the ground that they had become helpless victims of Fijian racism. A visibly annoyed New Delhi swallowed the bait hook, line and sinker.

Budget in the Time of Change

Reflections on Restructuring

Kaushik Basu

This essay evaluates the 1991-92 budget and the larger reforms from a particular point of view. This point of view supports industrial liberalisation, freer trade regimes and an exchange rate policy which aims to establish current-account convertibility of the rupee in the near future. These policies are supported not because equity does not matter but because it does. The equity objective emphasises a second set of desirable policies. These consist of direct public action for the poor. While such action is urged on a much larger scale than has been undertaken thus far, it should be direct in the sense that its market-distortionary effect is as small as possible.

THE BACKGROUND

I REMEMBER as a child listening to a prominent politician, who was also a friend of my father, giving an avuncular lecture to my sister on the virtues of dressing *swadeshi* (prompted I think by my sister's insistence on some special skirt). He berated her gently for aping western customs and ended up saying, 'Why should we imitate westerners? They do not imitate us.' This logic troubled me because it was immediately evident to me that it was he, more than my sister, who was guilty of aping the west. In refusing to imitate westerners *because* they do not imitate us, *he* was imitating them! It had also seemed to me then that my sister was in a trap. If she wore the special skirt she would be imitating the west, and if she listened to my father's friend and abandoned the idea, she would—and, in fact, in a deeper sense—be imitating the west.

The predicament of a minority government trying to push through a major economic reform and confronting a profusion of advice is, though not as severe as that of my sister, not too dissimilar either. If it continues to subsidise fertiliser use, it is working at the behest of the rich farmer lobby. If it does not subsidise fertiliser consumption, it is surrendering to IMF pressure. If it increases defence spending, it is giving in to the arms manufacturers' lobby, if it does not, it is yielding to superpower pressure.

This time, more than in any recent budget, the opinions of parties in the opposition benches will matter in deciding what policy package finally emerges. I believe the left can and ought to play a dynamic role in ushering in structural change and liberalisation. It is unfortunate that thus far much of the left has been *status quoist*, with an almost instinctive tendency to react adversely to any suggestion of change. To expect the left to support liberalisation may, on the face of it, seem contradictory. So let me explain.

Fortunately, in this profusion of advice that has been offered in recent times, much would fall by the wayside simply on grounds of being founded on an erroneous view of how an economy functions. Hence a necessary (though by no means sufficient) condition for successful economic policy-making is to have professionalism in government. Career politicians and bureaucrats are simply in no position to draft economic policy in today's complex world. It is essential to utilise the large body of work in

economic theory and econometrics which considerably narrows down the policy maker's problem by helping us identify the *non sequiturs*.

The recognition of the power of natural market forces belongs to this core of economic thinking. These forces cannot be wished away in designing policy. To attempt to stifle them is simply to ensure that they will emerge through pathological routes. In India so much red tape has been used to strap up and stifle market forces that what needs to be done by any sensible government is obvious—the markets need freeing. This is a *precondition* for policies, left or right. Since I believe in the ultimate value of equity and equality, I am keen that liberalisation be used for these objectives and not get hijacked in favour of small elite groups as has happened in parts of Latin America. And this is where the left can play an important and perhaps critical role.

In this essay I shall evaluate the budget and the larger reforms from a particular point of view. This point of view supports industrial liberalisation, freer trade regimes and an exchange rate policy which aims to establish current account convertibility of the rupee in the near future.¹ But I support these policies not because equity does not matter but because it does. It is true that India's growth rate has not been too high. But that does not concern me as much as the fact that 66 per cent Indians do not have access to safe drinking water, 72 per cent do not have electricity, and India has more poor people than any other country and perhaps any other continent.

Since this essay delves into positive and normative economics and the latter can vary from person to person it is useful to begin by putting one's normative cards on the table. I shall judge the value of economic progress in terms of the progress of the poorest sections. Equality is also considered valuable *per se* but it is lexicographically secondary to the objective of poverty mitigation.² That is, greater equality is considered inherently desirable if and only if it is possible without hurting the poor.³ Everything else—liberalisation, deficit cutting, etc.—is of *instrumental* value.

This equity objective brings me to the second set of desirable policies. These consist of direct public action for the poor. I would urge such action on a much larger scale than has been undertaken thus far. However these actions should be *direct* in the sense that their market distortionary ef-

fect ought to be as small as possible.

An example of a distortionary intervention is what has happened in the past in terms of fertiliser pricing. One of the best moves in this budget was the decision to raise fertiliser prices and therefore remove a part of the subsidy. It is unfortunate that what has emerged after pressures from all sides is a hybrid of questionable worth. Dual pricing is bound to generate corruption. Moreover, it is not clear why anyone, small or large farmer, should receive subsidised fertiliser on a continued basis.⁴

What about the argument that small farmers are poor? Should subsidising them not be justified on equity grounds? My answer is No. Not all poor people are buyers of fertiliser. Hence, to subsidise fertiliser is to give special help to those who are poor *and buy fertilisers*. If we are concerned about the poor we should intervene directly in a few selected areas which are of value to poor people in general. I would include under this basic nutrition, health services and education. If the dual pricing is being justified on grounds of equity, it would be better to have a single, *market* price for all buyers and to use the money saved by the government (by virtue of not having a cheap price for the poor) *directly* on the poor, for example, on providing subsidised food for them. This way (1) the fiscal deficit will be the same, (2) the cause of equity will be better served (because now the poor will get what earlier was being given only to the fertiliser buying poor), and (3) a distortion in the fertiliser market would be removed.

This example is meant to illustrate a general principle. Price distortions are best kept to a minimum. Subsidies are not the right way to help the poor, it is better to give them direct help. Of all vested interests, the most damaging for the economy is the vested interest in price distortions. This can ruin economies witness the USSR.

With these preliminaries, I take a specific look at the union budget of 1991 and return to some larger issues of economic reform later.

UNION BUDGET

Like all budgets the one of 1991 has features to praise and criticise. I shall begin by drawing attention to three moves which deserve widespread support. These are (1) the decision to cut fertiliser subsidy (or raise fertiliser price towards its market level), (2) the freeing of interest rates at which banks and term-lending financial institu-

tions lend money subject to the floor of 15 per cent, and (3) the decision to value the wealth of investment companies in terms of market value instead of book entry.

All three are likely to have important fiscal impacts. (1) and (3) could contribute towards a smaller fiscal deficit. But that is not the reason why I support these. Their merit is as a signal for allowing the market to function.

In India we have a tendency to believe that property has intrinsic value. That its value depends on how people view it, which is in turn reflected in its market price, eludes us. This view has helped create a major tax dodge whereby enormous wealth gets valued in terms of old book-entries. Hence, (3) above is a small move in the right direction. It is indeed ironical that the same industrialists who have been crying hoarse for the market are objecting to valuation based on market prices.⁵

One of the most important features one looks at in evaluating an investment opportunity is its riskiness. Lenders are usually willing to lend at a low interest rate if they feel that the investment is safe. Otherwise a higher interest acts as a compensation for the extra riskiness. Hence, an inability to vary the interest rate thwarts the market for investment. Though some variability had been allowed in recent years, (2) is a laudable attempt to speed up the process. It is especially valuable as a signal to other sectors on the advantages of price flexibility.

I hesitate to return to the subject of fertiliser pricing not only because I have already commented on it in Section I but because so many economists have already written about it. But I must.

In one P. C. Wodehouse story⁶ we are told of a Nichols and a Jackson who went on a bicycling trip and met with a severe accident. They were blown into smithereens and the rescue team could assemble only one human being out of the debris. They got around the problem by describing the dead body as that of 'Nixon'.

What is happening to the fertiliser policy, as it is tugged from the left and the right, is like the hybrid 'Nixon'. It is unfortunate that this has been exploited by most parties. Yet it is exactly this kind of *vested interest* in price distortions which does wanton damage to the economy. Given the near consensus among economists about the need to allow fertiliser prices to rise towards their natural market level and the great political difficulty in achieving this, I want to suggest a scheme for solving the problem.⁷

The first step is to free the fertiliser price completely. This will immediately cause a steep price rise. Announce that with each bag of fertiliser sold the buyer will be given a coupon showing an amount, say Rs X, which is equal to the difference between the market price and the earlier controlled price. The coupon can be cashed for Rs X, by the buyer at any bank. Next, announce that Rs X will from now on be a fixed *subsidy*. I expect this to cause no protest (assuming that those who stir protests in these matters will not read this paper) because this year the net price that the buyer of fertiliser pays will be unchanged and people are myopic. It follows that from now on, with each round of in-

flation, the real value of the coupon will keep falling. So each year from now the subsidy will get cut, but no further announcements will have to be made; the subsidy erosion will happen continuously and will cease to be newsworthy.

This is not my idea. It is borrowed from Sri Lanka's experience with food subsidy. In 1978, soon after Jayawardene came to power, the Sri Lankan government, torn apart by fiscal crisis, reached a major decision concerning its food subsidy. In Sri Lanka 93 per cent of the population received rationed food. In order to cut down the expenditure the government decided to give subsidy only to the poorest half of the population and while making this change the government also decided to switch over to a food stamp system, whereby instead of directly giving free or subsidised food to the people, they were given coupons with which they could buy a certain range of basic food and goods. In politically conscious Sri Lanka, where any attempt to cut subsidies had earlier met with riots and severe resistance, Jayawardene's scheme went unchallenged because the poorest half seemed to be getting the same subsidy in the net. The catch was, however, that the coupon value was fixed in nominal terms. So from 1978 onwards the food ration has steadily been cut, but this has happened silently with inflation doing the job.

While I would not recommend this for food subsidy, for a variety of subsidies which have arisen because of vested interests in price distortions this is a method worth exploring as a scheme for removing subsidies which is politically feasible.

Subsidies have become an increasing strain on fiscal management. They rose steadily through the 80s and peaked in 1989-90 reaching 2.5 per cent of GDP. The revised estimate for 1990-91 puts it at 1.8 per cent. This means that the revenue deficit of 3.4 per cent in 1990-91 could have been brought down to 1.6 per cent merely by cutting subsidies.⁸ Whereas several subsidies can be justified as a form of direct action to help the poor (and so I would not recommend going the whole way), a substantial amount (perhaps more than half) is subsidisation in response to the demands of powerful lobbies.

It is this same kind of reasoning which suggests that steps ought to be taken to reduce the ratio of perquisites to salary. In India, both the private and government sectors pay a large part of salaries of personnel through perquisites. These amount to hidden payments and have introduced enormous distortions in our markets especially those for housing and fuel. Converting perquisites to cash payment can save the government a lot of money and I consider this a superior option to selling off public sector units. The amount of office space, land and housing owned by the government is very large. If we value the rental of these at market rates (and I would urge such valuation for the same reason as in the case of private investment discussed above) instead of some notional book entry, it will show how large our government's annual expenditure really is. Suppose the government gives a flat to an MP or a civil servant which could be rented out on the open market at

Rs 20,000 per month. Then effectively the government is spending Rs 20,000 per month. If then the government stops giving this perquisite and instead pays an additional salary of Rs 10,000 the government immediately effects a monthly saving of Rs 10,000. In fact 5,000 such apartments rented out on the open market would mean a net revenue of Rs 60 crore per year after paying the 'dispossessed' an additional monthly salary of Rs 10,000 each.

But this fiscal saving is not my main reason for recommending a move away from perquisites to cash payment. Even if the government pays the dispossessed the *full* market rent as additional salary, the switch will be desirable. This is because it is arguable that of this Rs 20,000 additional salary, not more than Rs 10,000 will be spent on housing. Hence, a major housing market distortion would be removed, with a concomitant rise in the supply of housing space. In addition, people will save more.

At present any such move would meet with stiff opposition but, if a small correction is made in our income tax law, the opposition will vanish. What I am suggesting is common practice in the US—certainly in the state of New Jersey. If you receive subsidised housing from the university, government or the private sector the extent of the subsidy—calculated as the difference between the *market* rent and actual rent paid—is added on to one's income in computing taxes. If this is done in India then most people would in fact prefer to receive their perquisites in cash so that they can allocate the additional income in keeping with their preferences.

Turning now to the negative features of the budget one of the most significant is the tax amnesty scheme. (So was the Rs 100 crore allocated to the Rajiv Gandhi foundation but fortunately that has now been dropped.) The amnesty scheme allows any person to deposit his black money with the National Housing Bank (NHB). 40 per cent of such deposits will be confiscated by the government as a sort of penalty. The depositor is then free to take out his remaining money immediately. The money thus raised by the NHB will be used for slum clearance and to build low cost houses for the poor.

Let me first point out that this scheme is superior to the Special Bearer Bonds which were sold against black money in 1981. The bonds mature in 1991 with 2 per cent interest per annum and can be encashed at banks with no questions asked. Why was it believed that this may be a better way for the government to raise revenue than the simple expedient of printing money? Presumably because printing money is inflationary. What actually happened with the Special Bearer Bonds is, however, worse. As people bought these bonds the government mopped up money at first. But soon the buyers realised that each bond certificate is like money and perhaps better. Firstly, the bonds were completely anonymous (no names appear on them). Next, since to be caught with a bond is not punishable, a bond could be used as white or black money with impunity. And indeed, the last 10 years have seen a thriving trade for which the bonds were serving as currency. Hence the infla-

tionary pressures generated were probably more than that printing money would have caused.

This year's amnesty scheme will not have the problem of fuelling inflation. Also, it will cut the fiscal deficit and not merely the budget deficit (as was the case with the Bearer Bonds). Nevertheless, amnesty schemes should be discouraged because they give wrong incentives concerning the value of tax dishonesty in a society. In addition, the tying up of expenditure to particular sources of revenue is not a good idea. This scheme, for instance, ties up the amount spent on poor people's housing with collection under this scheme. At first sight this looks like a noble cause, but what must be realised is that how much effort goes into this noble cause is now completely dependent on the vagaries of how much is netted by this scheme. My hunch is that very little will be collected under this (because 40 per cent is a bigger penalty than the cost in the open market for converting black into white) and that is probably this scheme's saving grace.

In future we must not think of black money as a revenue pool for the government. Black money needs to be controlled because it is degrading and because (what is not usually understood) it thwarts the market in the same way as bureaucratic red tape does. I come back to this later, and would simply remark that the best way to control black money is not to use carrots and sticks, but sticks. Instead of giving incentives, there should be a pre-announced date after which black incomes will be penalised more severely.

I would also like to see much more allocation by way of direct action for the poor. It is true that the allocation for education has been raised from Rs 865 crore in 1990-91 to Rs 977 crore in 1991-92, and the plan outlay for rural development goes up from Rs 3,115 crore to Rs 3,508 crore. But given the low level of social security expenditure incurred by the Indian state, there is scope for large increases in this direction.

And, finally, what will be the inflationary impact of the budget? Inflation is always difficult to predict but I would expect the budget to give a quick short upward push to the prices but to be relatively less inflationary in the long run. The quick short upward pressure will be as a consequence of hikes in the price of freight, railway fares, petroleum price and some excise rates. But studies have shown that in the long run it is large deficits which are more inflationary. Hence the cut in the fiscal deficit from above 8.5 per cent of GDP to 6.7 per cent, should be welcomed as a partial, long-run antidote.

INTERNATIONAL SECTOR

This year the international sector is the focus of special attention because that is the source of the current crisis. It has been argued by many, and I concur, that the present crisis is not in the real sector but is a crisis of confidence. It must however be realised that a crisis of confidence is worrying precisely because if it persists for too long it converts into a real sector crisis.

The crisis makes the management of the international sector particularly hard

because it drives a wedge between our short- and long-run interests. In the long run we must move towards much freer trade and, perhaps, also the current-account convertibility of the rupee. But these are not possible right now because a lower trade barrier may cause a short run worsening of balance of trade and convertibility could provoke capital flight.

Hence it is understandable why on this front the budget has been so tame. The tariff peaks above 150 per cent have been shaved off by placing a ceiling on the *ad valorem* rate of basic plus auxiliary duties of customs. Also, the import duty on capital goods of most kinds has been lowered from 85 per cent to 80 per cent. These are small changes but no more drastic measures were feasible at this critical juncture. Indeed what is more important than these changes is the long run intention expressed by the finance minister. This is perhaps the first time that a finance minister has spoken of a tariff cut as desirable and something that, though infeasible on a large scale *right now*, we should strive towards.

The more important structural changes have occurred outside the budget. The most discussed was the devaluation of 22 per cent within one week in July. It is difficult to have strong views on this. Unlike, in 1966, when India was on a fixed exchange rate regime today a devaluation is much less momentous. Since nowadays small adjustments in the exchange rate occur all the time, it is entirely possible that despite this devaluation, after six months we shall have an exchange rate at the same level as what we would have had if no devaluation had occurred.

To see the fallacy of obstinate opinion on this matter consider people who habitually oppose devaluation. If these people are asked if we should revalue instead, they typically say No. This reveals their innate preference for the *status quo* and an unwavering faith in what the RBI has *already* done.

The devaluation would be useful if it is used as a step towards greater convertibility of the rupee. The easing of the REP licence (now Exim scrip) rules and an increase in its proportion to 30 per cent is valuable precisely for this reason.

Where we have to be careful is with the NRI option. The present budget has announced two schemes for luring more NRI dollars. The first one essentially consists of giving immunity from our tax laws to hard currency remittance before November 30, 1991. The second scheme is to issue new bonds, called India Development Bonds, denominated in US dollars. Interest from these bonds will be income tax exempt as will be the principal from wealth tax. The bonds mature in five years. The bonds can be gifted to residents with immunity from tax laws.

While one can see the need for something like this as a fire fighting measure, one has to worry about its long-run consequence. The terms at which India borrows money from the world are still quite favourable. On average we pay an interest rate of 6.4 per cent which compares well not only with the rates at which Latin American nations borrow—usually over 8.5 per cent—but also China's

7.8 per cent. Similarly on average our loans have a grace period of six years, which compares well with, for instance, Argentina's two years and China's four.⁹

Borrowing from NRIs, on the other hand, occurs on much harsher terms. This means that the repayment burden would grow more rapidly for money borrowed from NRIs. Moreover, the belief that NRIs are patriotic and borrowing from them is politically benign is a myth. In the case of several countries, non residents have played a major destabilising role. In Nicaragua's case, for instance, it is not at all clear as to who played a politically more destructive role—the international lending institutions or the NRIs.

In the immediate run, no matter who we turn to—the IMF, NRIs or our gold—we have no option but to muddle on. Our aim is to somehow keep our head above water.

In the medium to long run we have to carefully rethink our export strategy to give it a bigger boost. Indian exports have done well over the last four years. And contrary to a widespread belief our import growth has not outstripped export growth and there has been no *secular* worsening of India's balance of trade. In 1980-81, our exports were 4.8 per cent of GDP, in 1989-90 they were 6.4 per cent. In 1980-81 our imports were 9.2 per cent of GDP and in 1989-90 the corresponding figure was 9.3 per cent. If we take the balance of trade (BOT) as a percentage of GDP the average figure for the first five years of the 80s was minus 3.4 per cent, and for the second five years it was minus 3.2 per cent.¹⁰ A slight improvement, if anything.

The thesis of increasing *structural* imbalance therefore seems to be untenable. The source of the crisis lies elsewhere. In the international sector India has always lived on the brink, importing more than she exports. A small crisis could therefore at any time act like the proverbial spark. During 1990-91 as a consequence of the Gulf war our petroleum oil and lubricants import spurted from \$ 3.8 billion in the previous year to \$ 6 billion. The decline in remittances from Kuwait and Iraq was of about half a billion dollars.¹¹ Our exports to west Asia also fell. The combined effect of these was to precipitate a crisis of confidence among India's international lenders, including the NRIs.¹²

In the long run the solution lies in our exports. A cross country comparison not only with South Korea, Taiwan, Singapore, Thailand and Malaysia but even China suggests that we can expand our exports manifold. The right exchange rate policy, low tariffs for importing relevant raw material and technology matter. But what matters most is an efficient domestic economic environment. But this goes beyond what can be achieved through fiscal instruments alone and is the subject matter of the next section.

SOME BASIC REFORMS

This section moves away from the proximate causes of our economic problems to more fundamental factors. But before that it is useful to get one common misconception out of the way.

Though we frequently fret that the Indian economy is excessively controlled and the

market is unable to function, it is worth being clear that it is not *really* a problem of more or less control but of control in the wrong areas.

In certain domains the Indian market functions more smoothly than in most other countries. Here we can *buy* the 'co-operation' of the income tax official; we can *buy* driving licenses; we can *pay* our way out of having to do pollution checks on our vehicles.¹³ Those who believe that *everything* should have a market price would do well to tour the Bihar economy to find out what one of the closest real-life approximations of their ideal looks like.

On the other hand, in India the individual freedom for economic enterprise is severely curtailed. The freedom to open a firm, to choose the price at which you will sell the product, to select the destination of your sales are all subject to greater restriction than is desirable. A part of this restriction is bureaucratically imposed. But it would be foolish not to recognise that many 'controls' are the *endogenous* outcomes of our history, culture and, perhaps, luck. Hence, my plea for more freedom to markets (which of course pertains to the kind of freedom being discussed in this paragraph and not the previous one), which is widely shared by economists in India today, is a much more difficult task than is commonly perceived.

This brings me to a related point concerning 'intervention'. It is important for an economist to be clear that 'intervention' is not a well defined term. In the US right-wing thinkers (and non-thinkers, for that matter) insist that having gun-licence laws amounts to an intervention which limits individual freedom, to wit, the freedom to carry guns. The fallacy in this case is obvious and arises from the erroneous presumption that it is only governments that can intervene and curb individual freedom. It overlooks the fact that one individual's freedom to carry a gun can severely curtail the freedom of other passers-by to continue in possession of their, respective, wallets.

This is the rationale behind anti-trust legislation which exists in all industrialised countries. While anti-trust laws curb a monopoly house's freedom, it is believed that they also curb sufficiently the monopoly house's freedom to curb the consumers' freedom for them to be worthwhile.

Despite these complexities it will be valuable if in drafting economic policies and laws pertaining to *economic* functioning a basic principle is kept in mind. The *basic principle* says that two or more consenting adults should have the right to enter into contracts, which do not hurt the interests of uninvolved persons, and, further, the contracting individuals should be able to turn to the state for action against someone who reneges on the contract.

This is not a new principle. In fact, it is at least as old as the mills. Both John Stuart and James had argued for similar norms.

I am aware that this is not an unambiguous principle and also that it has exceptions, but if we deviate too far from it, efficient economic functioning becomes impossible.

In India the basic principle gets violated

all the time. At times it happens in a way which is beyond the reach of the government, but there are areas where the government is responsible for its violation.

The main reason for this is the government's tendency to decide in advance as to what is a fair contract and limit individuals to some pre-specified and inflexible contracts. Take for instance rent control. Suppose persons i and j agree that j will rent out j's apartment to i for a very low rent for one year but at the end of it i will vacate the apartment. Now if i reneges and refuses to quit, in most Indian cities the rent control laws are such that j will not be able to get any legal help in enforcing the contract. This is a violation of the basic principle and it is the most important factor behind the high house rents that prevail in our cities.

Another kind of violation of the basic principle for which the government is only indirectly responsible occurs because of the prevalence of black money. Suppose i plans to do business with j which involves, first, i paying for some consignment of goods and then, later, j supplying the goods to i. Assume, as is quite common, that i is supposed to pay half the money by cheque and half by cash (that is, in black). Now even if the government is agreeable to taking punitive action against the party that violates this contract, the basic principle is likely to be violated in practice. To see this suppose j reneges and supplies only half the consignment. Even though the government would be willing to protect i, i is unlikely to seek governmental help because questions will arise about the source of i's cash payment. Hence, where black money is involved, even if the law is willing to take action on behalf of the aggrieved, the aggrieved would not seek legal help because he will rightly surmise that he will get into a different difficulty himself.

The upshot of this is that in India you do business with people with whom there is prior mutual trust. This collapses quite drastically the scope for business and deters the entry of newcomers.

The inability to sign contracts and have them enforced through the government is, I think, one of the most fundamental factors behind the inefficiency of the Indian economy. To rectify this will of course require a major overhaul of our law (especially that pertaining to the economy) and its implementation. The quick and efficient implementation of the law is very important. Increasingly, the transaction costs of fighting a case (in terms of money and, more so, time) has become so large that most people consider the law to be beyond their reach.

Economies tend to live from hand to mouth. A fiscal crisis arises and all attention turns to taxes and expenditure. A balance of payments problem crops up and we rush to rectify the exchange rate and adjust our trade policy. In this rush to stitch up a rupture here and fight fire there, it is easy to neglect the root causes of the malaise. The issues raised in this section escape notice precisely for this reason. Yet, in the long run their importance is immense and much greater than most people realise.

Notes

- 1 The recommendation of convertibility is not being made without reservations. The popular belief that for a poor country to have a freely convertible currency is to court immediate disaster is clearly fallacious. The Thai baht is both convertible and thriving. Nevertheless, the switch to a convertible currency is a bit of a leap in the dark. On balance, though, I feel that it is a desirable objective.
- 2 Though I cannot immediately think of a situation where I would violate this value judgment, experience suggests that exceptions there will be. This may therefore be thought of, in the language of Amartya Sen (1970), as a 'non-basic value judgment'.
- 3 That greater equality *can* hurt the poor is not difficult to see. Consider a society committed to complete equality. That is, it collects the national income and divides it equally among all citizens. Hence, an individual's endeavour is unrelated (ignoring infinitesimal changes) to his income. In such a society it is likely (at least in today's world) that no one will work. Hence equality will lead to abysmal poverty.
- 4 An initial subsidy to encourage farmers to 'discover' the benefits of fertiliser application can be justified by the analogy that new products are at times sold even by private concerns at specially low 'introductory' prices.
- 5 See, for instance, *The Economic Times*, New Delhi, August 10, 1991, pp 1, 4.
- 6 I relate this from memory.
- 7 I have written about this earlier in *The Economic Times*, February 23, 1991.
- 8 All figures in this paragraph are from the *Economic Survey*, 1990-91, Government of India. In a recent paper, Mundle and Rao (1991) show that the aggregate subsidy given by the centre and the states far exceeds the explicit subsidy which is usually recorded in government documents.
- 9 The data quoted in this paragraph are from the *World Development Report*, 1991, World Bank.
- 10 The data cited here occur in Table 9.1 (p 152) of the *Economic Survey*, 1990-91.
- 11 *Economic Survey*, 1990-91, p 155.
- 12 I have discussed at length the fragile nature of confidence among international lenders and the causes of such fragility in Basu (1991).
- 13 It may appear at first sight that official penalties have very little effect on our functioning since bribing is so common. However, it can be shown (Basu, Bhattacharya and Mishra, 1991) that the equilibrium level of bribes depends on the level of penalty. Hence, even if no one in the end pays the penalty, the penalty can be used as a deterrent though at an impaired level of effectiveness.

The Woman as Communal Subject

Rashtrasevika Samiti and Ram Janmabhoomi Movement

Tanika Sarkar

One of the most striking features of the recent Hindutva movement has been the foregrounding of the militantly communal Hindu woman in a variety of unprecedented ways. Nor is this phenomenon a flash in the pan. The BJP has located women along with SC/STs as a primary target area for the coming times.

This article argues that the new communal phase enables women's self-constitution as active political subjects in dangerously unprecedented ways.

THE Rashtrasevika Samiti, the little-known women's wing of the RSS, is not an isolable unit, complete within itself, but one tied into a whole nexus of interrelated communal institutions. The purpose of the present discussion is to see it in relation to the Ram Janmabhoomi upsurge: how and how much the 'samiti' contributed to it, what new turns the movement imparts to the samiti and what possibilities the connection holds out for the present phase of Hindu communalism.

One of the most sinister features of recent Hindutva movement has been the foregrounding of the militantly communal Hindu woman in a variety of unprecedented ways. Rural women at Bhagalpur in 1989 or upper middle-class Maruti-driving women at Ahmedabad last year have appropriated active roles on the centre stage of riot scenes where they would rarely put in an appearance before—an ironic inversion of the woman's traditional invisibility. According to VHP reckoning (which was conveyed to us at their Ramakrishnapuram office at Delhi in February) 20,000 'karsevikas' courted arrest on January 4 alone and a total of 50,000 were involved in the entire December-January round of satyagrahas. The VHP fortnightly *Hindu Chetna* of December 15 displays a cover photograph of 'karsevikas' sporting the saffron headband. The caption says: *Matrishakti ka abhyuthhan*. Its Ayodhya office is selling works by women poets, like the *Shraddha Suman Mala*, which celebrates sacrifices by mothers and wives of martyrs. An official VHP account of the October/November events, the *Amar Shaheed* pamphlet, accords particular importance to Vijayraje Scindia's arrest. If *Kalchakra*, a Hindi VCR newsmagazine, focuses long and pointedly on the victim figure of a lone woman resister being dragged away by the police on October 30, then the woman as a dynamic leader is highlighted by the *Newstrack* (covering the October events) where Scindia is striding purposefully between two senior and enormously respectful police officers towards a car from inside which she is shown again as leaving messages for the future conduct of the movement. VHP office-bearers in Delhi spent a long time explaining animatedly to us the precise differences in the quality of speech between Uma Bharati and saddhvi Rithambhara. And finally, and most obviously, if Advani and his 'rath' had been the visual emblems of Ram Janmabhoomi, then the voice and the words that fixed its

message belonged to a woman.

Nor is the phenomenon a flash in the pan. The BJP has located women along with SC/STs as a primary target area for the next elections and, for the first time, has formed a new group of full time women cadres to work for them. I would argue in this article that the new communal phase enables the woman's self constitution as active political subject in dangerously unprecedented ways. Does it then indicate that it is somehow more enabling than the left women's movements? Since this is not the place for analysing the left record, I would make an obvious point to which I shall return later. The left and radical women's movement as a whole (and this has been most powerful form of organised women's movements in India) is not impressive simply in its social and geographical reach, organisational strength and the range of its concerns. It also constitutes one of the most serious challenges to the combined and interrelated powers of patriarchy, class, caste and the state. The Hindu communal groundswell on the other hand, has been restricted largely to urban UP, to predominantly high caste, middle class milieus, as even VHP activists admitted to us. At the same time, the strength of the new phenomenon must not be underestimated. Karsevikas have been mobilised from traditionally the most conservative backgrounds—upper class, middle ranking service sector and trading families. The very limits of the movement may then be taken as signs of strength within a different kind of reading. Nor can we draw false comfort from any illusion that these women are not speaking their own minds, their own words. An interviewer (P K Datta, who visited Ayodhya in January) speaking to a bunch of male satyagrahis was, for some time, faced with an array of archaeological-historical arguments as well as the standard RSS definition of Bharat as 'pitribhumi', 'matribhumi', 'punyabhumi' and 'karmabhumi'. Then Chandravati, a woman from Aigarh, excitedly broke into the conversation and introduced a very different note: *Yahan aye hai khoon barsane ke liye...mandir ka arth mulla ko phansi lag jai...Mulayam aur VP ko phansi lag jai...* (We have come here to shed blood...the meaning of temple building is that mullas should be hanged, Mulayam and VP should be hanged). The whole discussion was subsequently shifted to a markedly more violent plane. Nor does it mean that women voiced mere mindless abuse. Each of the karsevikas

interviewed—VHP as well as non-affiliated ones—played a distinctive individual variation on the themes of Ram Janmabhoomi and Hindutva. For Vijay Dube, a would-be sanyasini from Ghaziabad, Hindutva implied a sweeping, millenarian vision of collectivity ('samashiti'). *Yah (Hindustan) samudra jaise gambhir hai, akash jaise vyapak hai...Hindu hi adi un hai.* (It is as deep as the ocean, as endless as the sky...the Hindu is the beginning and the end). Unlike other religions it is not time-bound but eternal. It is not an individual but a collective experience. It finds its centre of gravity in Ram Janmabhoomi which then becomes: *Hamara sarvaswa hai, dharam ki but nahin hai, sarvasarvaswa hai.* (It is everything to us, it is not just a matter of religion it is all, it is our everything). With the liberation of Ayodhya, *poora vishwa badal ho jayega, ek naya shrishthi ka nirman hoga.* (The whole world will change, a new creation will come into being). For Mithilesh Vashisti, a VHP worker from Modinagar, on the other hand, the value of the movement lay in the assertion of strength and self-respect against oppression: *Atyachar, anyay nahin sahenge, kisi chees ka seema hoti hai* (We will not tolerate oppression and wrongs, everything has limits). Another (unidentified) woman intervened with a more poetic-mythical version of the necessity: *Yah hamara ung hai, hamara abhushan hai...Krishna bhagawan ka chakra hai.* (This is a limb (in our body), an ornament...it is the 'chakra' of Krishna 'bhagawan'). All karsevikas were bursting with speech—with arguments and descriptions, each had an accent very distinctively her own. Within an as yet limited social and geographical scope then, the Ram Janmabhoomi movement seems to have enabled major breakthroughs in women's political self activation, not available to earlier communal upsurges. The relevant parallel seems to be with phases within Gandhian mass movements or the final stage of revolutionary terrorism in Bengal when an intensely devotional form of patriotism admitted women as full-fledged activists.

In a curious way the present movement inverts the usual pattern of symbolisation within national and earlier communal movements. So far, in both, the fetishised sacred or love object to be recuperated had been a feminine figure—the cow, the abducted Hindu woman, the motherland. When we had interviewed B L Sharma, secretary of

the VHP Indraprastha unit last April, he had woven an entire anti-Muslim tirade around the figure of the endlessly raped or threatened Hindu woman. Sanatan Dharmi and Arya Samajist office-bearers extended the image into that of a perpetually exposed and endangered motherland. Here, however, the occupied 'janmabhoomi' belongs specifically to a male deity, and women are being pressed into action to liberate it and restore it to him, to bring back honour to Ram. Ram's army of monkeys and squirrels has now acquired a new combatant and Sita's sex is coming to the rescue of Ram—in inversion of the epic narrative pattern where Ram and his army had to go and bring Sita back. The reversal of roles equips the communal woman with a new and empowering self image. The woman has stepped out of a purely iconic status to take up active position as a militant.

In this context, the very careful and significant handling of the baby Ramlala image acquires new meaning. Stalls in Ayodhya sell a large number of stickers and posters depicting a chubby infant baring his pink gums in a toothless smile. Local legend has it that in 1949, just before the deity miraculously reinstalled itself within the mosque, a police constable had found a dark and lovely child playing by himself in that corner—the homeless baby had come back home to claim his patrimony. The VHP video cassette produced by J K Jain, the *Bhaye Prakat Kripala*, reproduces the event over a long time, with the child within the mosque displaying himself in a variety of 'cute' poses and eventually stringing a bow. We must remember that Ramayan and the Ramkathas resonate with the many losses of Ram. He loses his kingdom, his father, he is separated from his mothers and his brothers and then he loses Sita—this is a figure bathed in tears, a reason, perhaps, why the common man and woman can identify more with him than with other mythical heroes. The entire series of deprivations has now been collapsed into the shape of that irresistible human idol—the deprived male infant. On top of that, within the mosque and next to the main deity, is an icon of the crawling Ramlala—a posture traditionally associated with the baby Krishna and linked to a long chain of associations with emotional and aesthetic structures. While the appeal of the homeless baby would be a general one, it would be especially poignant for women. Readings of recent events that insist on a monolithic militarisation of Hinduism by present iconic trends, therefore, miss out on their versatility which is their most remarkable feature. While the Ramlala appeals to the mother in the woman, the warrior Ram probably simultaneously arouses a response to an aggressive male sexuality.

All this, as I had said earlier, is a relatively new development. Up to the middle of last year, well after the shilanyas ceremonies with their attendant riots were over, there was practically no literature by women that VHP or RSS offices sold regularly. VHP news

sheets that covered 'shilapujan' and shilanyas ceremonies gave no space to her writings. Even Rithambhara's cassette addresses its invocations to rise and fight exclusively to men. *Birbhayon jago'* (Brave brothers, awake). Her speech obviously targets women listeners as well. There are intimate references to domestic politics among mothers, sisters and daughters-in-law, to women's work within the home. Yet each time the call for action is issued, it is addressed to brothers. "You have to make yourselves in to a clenched fist, my brothers." Inspirational feminine examples relate to motherhood: how Bhagat Singh's mother was found crying after his death, not because she had lost her son, but because she had no other son to be martyred. Even the Rani of Jhansi is invoked as the mother of a brave patriot. It is true that the *Bhaye Prakat Kripala* cassette inserts the warrior figure of a queen as an adversary of Babur, and, within the current movement, Saddhvi Rithambhara, Saiyavani and Vijayraje Scindia are endowed with an exalted position. They are, still, exceptional, rare figures. Up to this point, then, women are still the productive womb, mothers of heroes. Their presence was minimal on the crucial days of October 30 and November 2. At the Rashtrasevika Samiti office I was told quite frankly that the decision to train karsevikas was the result of an internal debate that was eventually won by younger samiti members.

A new shift has, therefore, occurred very recently, a shift that is pregnant with possibilities for Hindu communalism as well as with problems. Communal organisations have not allowed a demonstratively public or even a very active political role to women so far. The Rashtriya Swayam Sevak Sangh is—and this is a very significant fact—an exclusively male organisation. When Lakshmi Bai Kelkar approached Hegdewar in 1936 with an appeal to admit women as members, she was refused and Hegdewar later helped her to set up a parallel but separate organisation with a small yet significant difference in name: the members of the RSS are Rashtriya Swayamsevakas while the members of the women's wing are Rashtrasevikas. There have been debates within the RSS about giving membership to women but so far the 'sangh' has remained uncompromisingly male. The Rashtrasevika Samiti has kept a remarkably low public profile through the six decades of its existence. Even though it is one of the oldest women's organisations in the country, its total membership is about a lakh now and is largely restricted to traditional RSS and BJP bases—Maharashtra, Karnataka, Andhra Pradesh. The Delhi wing was formed in 1960 and now includes about 2,000 samiti members. Sakhas are located almost entirely in middle class areas: Karolbagh, Patel Nagar, Janakpuri, Naraina Vihar, R K Puram, Lajpat Nagar, Kamla Nagar. Volunteers come from enterprising trading families or from middle ranking government service background. The VHP Mahila Mandal, which started operating in Delhi from the 1980s, has about 500

members. The two mass fronts of the VHP—the Bajrang Dal and the Durga Vahini—are strictly segregated. The growth in spatial, numerical and social terms has been quite low compared to the Delhi-based radical women's organisations which have come up much later, or to mass women's organisations under left political parties. The All India Democratic Women's Association, linked to the CPI(M), was founded in 1981 and now has a membership of about 29 lakhs, overwhelmingly rural in composition. The Janawadi Mahila Samiti, its Delhi branch, has about 15,000 members, with large bases in labouring areas. The comparison is relevant since the VHP Mahila Mandal and the Rashtrasevikas also work (unlike other radical voluntary women's organisations) in close collaboration with an electoral party and a number of affiliated mass organisations.

What does the apparent contrast between the austere reserve of the organisations and the recent flamboyant wave of a militant reclaiming of the public spaces by women denote? Is it a break, a total departure, or is it the culmination of a long drawn out strategy? Or, is it a consciously planned extension that stretches out old boundaries?

II

It seems that we can usefully approach this problem through an extended reference to the very familiar cassette of saddhvi Rithambhara. One remembers that voice only too well: high pitched shrill, breathless, delivering a non stop harangue with no modulation. The voice seems always almost about to crack under the sheer weight of passion. The overwhelming and constant impression is one of immediacy, urgency, passion, spontaneity. For over 60 minutes extreme stress is continuously conveyed and speech seems to be improvised as if on the field of battle—an inspired voice speaking recklessly from the gut. The later ban would heighten the earlier impression of impending martyrdom while legends about the 'martyrs' of October 30 and November 2 would subsequently feed back into the effects of the cassette. The cassette, then, is not a finished product but one that grows with events. New technology opens up unprecedented audio visual possibilities for political messages and stretches boundaries of orality. The startling impact of the original *maidan* speech becomes simultaneously preserved and fixed and can duplicate its own efforts endlessly to ever growing audiences at will in changed political conditions. By preserving and replaying the human voice and the spoken word, a different kind of impact is attained from the one resulting from re-reading a written text. The latter also grows and acquires new meanings over time but it remains an individual exercise, a private act. The spoken word addresses and whole congregation and proceeds through a continual interchange of passion between the speaker and the listeners. New technology is able to recapture that exchange *ad infinitum* for

freshly or differently constituted congregations, and at the same time, allows the first message to fatten on new meanings and associations gathered from the movement unleashed by itself, growing from its own self fulfilling prophecies. Rithambhara's woods on martyrdom would have much enlarged and transformed meanings for people listening to them after October 30.

The technology naturalises the intended effect to such an extent and covers its own traces so completely that we forget that what we are listening to is recorded speech and not a live recording of an actual speech either. That sustained high pitch and that non-stop delivery would be impossible to improvise without breaks or modulation. It is a studio composition, an artefact which, with meticulous deliberation and co-ordination, pieces together over long stretches, a carefully rehearsed address. The greatest success of technology lies neither in preservation nor in duplication but in its naturalising abilities, in its self-effacement.

Without drawing an exact and mechanical parallel, and without reducing the movement to mere contrived effect, we can still relate the impression of spontaneous militancy to an elaborate and finely tuned institutional structure and a shared ideological stockpile that tie together a wide range of party, mass fronts and movementist bodies to the apex body—the RSS. Each individual organisation—the BJP, the VHP and their various fronts—has developed its own distinctive thrust area and all have internally circulating members. A senior VHP Mahila Mandal leader has recently gone over to help out with BJP Mahila Mandal work. Rashtrasevikas claim to have trained the Durga Vahini for the karseva even though the latter is affiliated to the VHP. Almost all BJP women MPs are members of the Rashtrasevika Samiti. Co-ordination, in fact, stretches beyond the core of institutional cluster. Rashtrasevikas are offered hospitality for their training camps by Sanatan Dharm mandirs and DAV schools. The samiti is closely associated with a chain of nursery schools run by the Saraswati Shishu Mandir. The VHP headquarters at Ramakrishnapuram houses one of those schools. The school at Naraina Vihar has a very distinctive visual plan and layout. Instead of the usual pictures of flora and fauna or of nursery tales that decorate nursery schools, walls on one side display frescoes of Hindu historical heroes locked in battle against Muslims. On the other side are portraits of Hindu freedom fighters with appropriate messages inscribed below. The central building has the map of 'akhand bharat' draped around the figure of Bharatmata with the entire 'Bande Mataram' hymn inscribed below it. The DAV school on Aurobindo Marg follows an almost identical visual display.

An intricate and delicately-balanced system of inter-locking personnel, functions and interests is ultimately monitored by the apex parent organisation—the RSS. The sangh calls itself a family, not a political

organisation. As proof of this it claims that all its members are equal and uniform in dress, disposition and functions. This stems from a remarkably peculiar notion of what a family is, since there cannot be a family without women in it and there cannot be a family that is ever undifferentiated in functions and habits. Only by developing a women's wing, then, does the family metaphor partly realise itself. The Rashtrasevika Samiti was, after all, the first affiliate that the RSS helped to foster, although a good 11 years after its own foundation. The family model is not just a metaphor. All the samiti members that I talked to had male relatives in the RSS. In fact the striking ease and self-confidence that animate the very vocal participation of even junior office-bearers in a discussion with their elders may partly be explained by the status of their male relatives within the sangh. This might carry greater importance than the order of ranking within the samiti itself. Within the Delhi VHP Mahila Mandal, too, the three top figures are all married to VHP leaders.

The organisational principles of the sangh provide the pattern for the samiti. It does not have internal elections and the 'pramukh sanchalika' nominates her successor. Office-bearers are selected by senior members. Samiti 'pracharikas' are unmarried women, repeating the accent on celibacy that characterises RSS 'sarsangchalaks', all of whom so far have been bachelors. Much of RSS ritual is also replicated within the samiti. The strict and detailed code of regulations for setting up and disbanding the daily sakha, the physical and martial arts training (the samiti provides for lessons in yoga, sword and lathi play, judo and stengun fight), regular 'boudhik' or ideological discussion and the discipline and protocol within sakha programmes are common to both. Whereas the RSS observes six annual festivals—five of which are connected with traditional religious events and the sixth, the Shivaji Utsav, is a Hindu nationalist celebration—the samiti observes five and omits the non-traditional festival. The major hymns are also more or less the same and are recited individually as well as collectively in exactly the same order. At the same time, a fine tension exists between vociferous claims to complete autonomy and pride in sharing the RSS heritage. Vidushi, a young office-bearer, told me rather defiantly that the two bodies are totally distinct as two railway lines are which run parallel, yet always separated. The analogy, however, comes straight from Golwalkar. In a different sense, too, as we shall see later, the samiti supplements certain kinds of sangh work, in a way thereby reiterating the conventional place of the Hindu 'dharampatni' within the household—a related yet subordinate sphere.

In the 'boudhik' sessions within the samiti I came across the same finished structures of thought, the same basic themes on which variations are played by Rashtrasevikas, the BJP, the VHP, individual karsevaks and sevikas and loose fragments of which have come to constitute parts of popular common

sense among non-affiliated informal support groups for Hindu 'rashtra'. Resonances of such views or values are heard even in the very different, far more rarefied academic atmosphere of sections of the radical right and the radical left. The RSS occasionally plugs into a whole range of otherwise radical issues—ecology, world peace, interrelated critiques of western materialistic and monolithic notions of truth that lead to imperialist suppression of non-western identities.

Here I shall take up a single theme which I heard being expounded at a samiti training camp and about which I read up in samiti and RSS literature. This was the symbolism of the 'bhagwatdhvaj' or the saffron flag which is ritually worshipped at the beginning and of each 'sakha'. The discourse starts with the unique philosophical concept of tolerance within Hinduism—*Sarva dharma sama bhava*—which celebrates pluralism and the many equally valid ways of reaching god. This very pluralism and tolerance, however, characterise a single national ethos which is essentially Hindu and to which all immigrant religions have adapted themselves. The notion of an essentially Hindu national ethos came under attack when 'fanatic' Muslim rulers ruled the land and tried to destroy it with 'brute strength'. The British, however, 'planned to subvert the Hindu mind itself'. This was achieved through a seemingly superior and successful mode of western knowledge which induced self-forgetting and which substituted alien categories of thought for self-knowledge. The perception of a single national ethos was broken up and Indian history was restructured to prove that the nation means simply a geographical space inhabited by different but equal communities, each with its separate ethos. This false and alien notion of secularism destroyed the single shared culture and fractured the sense of wholeness, led to communalism and violence, and eventually culminated in the partition. The sangh aspires to recuperate that essential wholeness through its struggle for Hindurashtra. As an RSS pamphlet puts it, "*Vishal Hindu Bharatiya Samaj bhavi swamyat sevak... sangh samaj me sangathan nahin, samaj ka sangathan hai.*" (The sangh is not an organisation within society, it is organisation of society.)

Our true history today is folded back into certain symbols that have resisted western distortion. The saffron flag, used in the past by Maharana Pratap and Shivaji, is one of them. At the National Flag Committee deliberations even Azad had accepted it as our national flag, but Nehru, the alienated wrong-headed secularist that he was, refused to do so. Yet another symbol is the hymn 'Bande Mataram' which captures the essential shape of Bharatmata and for that reason must be recited in its entirety—'akhand' recitation being the equivalent of akhand Bharat. For the same kind of reason this was substituted by *Jana gana mana* as our national anthem which Rabindranath had actually composed to welcome George V. The whole story is of course a complete fabrication, but was reiterated by a whole range of

samiti members with complete assurance.

Somewhat like the sangh, but much more emphatically so, the samiti leaves alone charity or social welfare work and has no interest in union activities. Numerical expansion or extensive mobilisation has not, then, so far been the primary concern which explains their low growth rate. It is an intensive physical and ideological training-centre out of which a small group of handpicked cadres is regularly selected and sent out to circulate among the affiliated organisations and movements.

That kind of intensive mobilisation works best during its first formative phase within a same-class situation where recruits and teachers do not constantly need to break down boundaries within their own disposition and habits to communicate and interact with one another. Mobilisation is then horizontal, unlike the vertical spread of radical women's organisations which reach out to less privileged sisters as soon as they form themselves. The breadth of the latter's concerns and connection is undoubtedly their greatest strength, yet the samiti does, perhaps, score over them in a greater initial ease in interaction among all its members. A VHP worker described the sangh-samiti combine as engaged in 'class work' rather than in mass work. Class here refers to a class-room situation where all participants usually share the same social milieu. The description is quite precise since the training is pedagogical in a very total sense. Not just the arguments but an entire mode of arguing, a particular disposition is slowly nurtured within the person, leaving a distinct mark on the more engaged activists—a calm, quiet confidence, an unhurried, patient and seemingly reasonable exposition which proceeds by agreeing with the other person as much as possible and then gently suggesting and building up its own basic themes.

For the samiti, the daily sakha is not the sole or even the most major form of activity. The family concept is extended to cover the members' families in a number of ways. The samiti's guardianship role in the case of unmarried girls is carefully meshed in with an acknowledgement of the primary rights of the family. If the family obstructs the girl's desire for further studies, a particular profession, or a late marriage, the samiti at first tries persuasion. If this fails completely, the family's decision stands. The same policy is followed over problems of the girl's boyfriend or self choice in marriage. Rekha Raje, a pracharika hastened to assure me that the samiti tries to fill up their time with 'healthy' pursuits and such problems, therefore, rarely arise. If they do, the samiti first inspects the boyfriend. Once he is found to be suitable it then tries to persuade the family. Again, it is the family which must ultimately decide and on no account should the girl be encouraged to disobey.

Prospects of persuasion are enhanced and problems of divided loyalties averted by regular visits to the girl's home and the systematic cultivation of warm personal con-

nections. A young member told me that they make a point of visiting each other's homes and dropping in for tea whenever they happen to pass that way, so that the entire family is included within the circle of the samiti solidarity. Adhyapikas from the sakha go over regularly to discuss a member's behaviour and prospects with her relatives. The samiti is then carried right into the heart of the domestic space and ceases to be an institution within the public sphere. Even if the girl's own connections with her sakha snaps for some reason, durable contacts had been made with the parental family and the zone of influence had been permanently expanded. For small towns where individual samiti workers find it difficult to keep a sakha going, the samiti sends instructions every three months, keeping the member posted on samiti developments, ritual to be observed within this period and on how to attain a base among women of her acquaintance on a non-formal basis. At Khurja in west UP, Prabha Aggarwal, coming from a staunch RSS family, managed to set up a sakha which acquired 50 members. A scandal involving a local BJP pracharak, however, made parents withdraw their daughters from the sakha. Prabha now follows the 'correspondence course' of posted instructions, a spreads samiti festivals and rituals on a home-based format. The local Saraswati Shishu Mandirs do the rest of the work, on school premises.

Solidarity and warm supportiveness is more actively expressed when samiti members take turns with cooking and nursing whenever there are major illnesses in a member's house. The sakhas have a strictly local character and these gestures find them strong roots in the entire neighbourhood. When a girl marries off into a non-RSS family and her new domestic situation prevents active sakha work, senior sakha members regularly visit her in-laws and strike up a close relationship with them. The married girl then acts as a pivot within a new domestic set up, a new neighbourhood. The samiti in fact encourages her to drop sakha work for the first few years after marriage, until her status in her new home is firmly established and her samiti friends are accepted by the entire family. If, however, the in-laws still discourage a connection with the old sakha, she is again not advised to assert her choice. Her old samiti members of the local branch keep in close touch with her and with her family. She is given a few easy exercises that may be done even within a fairly crowded home and she is told to teach them to women relatives in the new family. She is also advised to establish herself as an ideal counsellor and arbiter for women within the family. Once that position is attained, she can then informally discuss the ideas she had been trained in during her sakha days or which her samiti members have kept her attuned to. One can see how useful such a loose and informal network would, have been to inculcate notions of 'Hindutva' and 'Hindurashtra' over a long period of time, and then, to swiftly link them

up with a violent agitation which would find a ready support base without any direct and immediate organisational investment. Gradually her reputation as a dependable adviser and friend in need will spread to the women in the neighbourhood and enlarge and stabilise a circle of dependents and listeners. For the women within the kinship network and the immediate neighbourhood, the presence of such a woman ensures an informal forum for the discussion of general topics. This way she fills up a crucial gap and appeases a very real hunger for serious intellectual discussion among women which traditionally only religious topics used to provide. Women's religiosity is usually explained in terms of certain emotional, cultural or social needs. A very vital function of religion is hardly taken into account: that it alone gives her access to a world of meanings enclosed in epics, allegories or other forms of religious texts that she can interpret and dwell on, and thereby transcend her own immediate and closed world of limited experience. The samiti partly continues these themes and partly weaves them into a different and larger political fabric. A Haryana housewife activist told me that for her the highest value of the samiti lay in exposing her to the world of thinking beyond household, or personal matters. Golwalkar had seen a lot of possibilities in such household-cum-neighbourhood circles for women working for the sangh and these possibilities have been much extended since his times.

Informal training for unaffiliated wives of RSS activists is yet another important field for samiti work. At a samiti training camp, a whole session was reserved for them, followed by a joint lunch and a group discussion of their problems and possible activities. I found that the wives were as familiar with samiti activists and activities as any formal member. I met a school teacher wife of an RSS activist who has been married for five years, before which she had had no contact with that organisation. Now, even though she is not a member herself, she managed single-handedly to persuade her entire body of colleagues to join a day-long protest fast at Ajmal Khan Park after the October 30 deaths. Her account of the samiti and the sangh was as detailed and as confident as that of any activist's. Her work, she told me, was manifold. She has to coach her two tiny children thoroughly in the daily sangh mantra recitations and cultivate proper 'samskaras' in them. She, along with other RSS wives, makes a point of bringing them over to samiti ceremonies as early as possible so that it becomes a second home to them. Another function was to help out with needy RSS families in her locality. Her husband, for instance, would tell her if one of them was getting a daughter married. In that case all the more affluent wives would divide up parts of the dowry to be collected among themselves. They would also get together to help out if a distressed RSS member or someone in his family suddenly needed blood. RSS members are required to

donate blood and keep their certificates precisely for this purpose—to have access to the blood bank in emergencies. Apart from being a far-sighted and practical form of support, this probably fosters the notion of a blood brotherhood. In her professional capacity the wife is expected to gather in fluence and respect for her ideas and attitudes within her place of work. Much of the samiti's activity is then informal and directed at constructing an ideal, totalitarian RSS family. The concept of expansion is a family by family, mind by mind, building up of the Hindu nation—an incredibly patient, long term strategy. It is, to stretch a concept of Gramsci, a form of hegemony built up on a molecular model.

III

Is the samiti then merely filling up a space marked out for it by the sangh for its own purpose? And, if so, does not this conclusion contradict a statement that I had made earlier in the paper—that the strength of the movement lies in the exhilarating possibilities it creates for certain sections of deeply conservative women, in its being an expression partly of their own creativity?

I think that the original parameters worked out by sarsanghchalaks have proved to be flexible and accommodating. The major body of Golwalker's instructions for women had carved out a sort of a Lakshmanagandhi of faithful motherhood with which the properly instructed mother carefully guards her children from corrupting western influences and instils in them the right sanskaras—filial piety, knowledge of patriotic heroes and of religious texts. Rashtrasevikas have travelled a long distance since then without overtly resisting the original instructions. The gap between the original impulse and the new self definition may or may not open up fissures within the movement, depending upon the versatility and suppleness of the sangh ideology, both of which, I fear, are considerable.

Somewhat different pulls seem to be working within the samiti itself, though it would be crude and false to categorise them as potentially feminist versus overtly fundamentalist one. Varieties of emphasis, nonetheless, remain interesting. In the first place, there are somewhat different versions of the origin myth of the organisation. Neither the authorised history of the samiti, nor the accounts of a senior office bearer and a pracharika mentioned anywhere that Hegdewar was first approached to admit women into the sangh and that he refused and helped Kelkar to set up a parallel organisation. It is an RSS publication that dwells on this fact and claims that Hegdewar convinced Kelkar about the problems of a common organisation. Samiti accounts, then, seem to need to push away the fact of that refusal. Again, the official samiti history has a somewhat different explanation for the samiti's foundation. It says "*Hindutva jagaran ka pramukh dhyeya lekar is swatantra sangathan ka shubharambha huya*" (with

the primary aim of the awakening of Hindutva, this independent organisation began its auspicious start) Rekha Raje, a pracharika, however narrated how Kelkar on a train journey had witnessed a young girl being raped by goondas (not Muslim ones, she replied to my question) in her husband's presence. She realised that since Hindu husbands cannot protect their wives, they have to strengthen themselves. Whereas the edge in this story is turned against the failures within Hindu society—Hindu male violent lust and Hindu male cowardice—the official text overlays that version by the broader and more general aim of Hindutva 'jagaran'.

In the self explanations and self definitions produced by the samiti there is primary emphasis on physical courage and strength on a trained hardened invincible female body. The sangh too, defines this—cultivation of Hindu woman's physical strength—as the first principle and then goes on to list 'intellectual grasp of the values of Hindu culture and devotional attachment to the ideals of Hindu womanhood'. A samiti publication puts it in stronger terms: "*Swasangrakshanksham nari ki samaj me adhik pratistha hoti hai* (a woman who is able to defend herself gets a larger status in society). The specific deity which sums up their aspirations is the militant icon of 'ashthabhuja' Durga who subsumes Saraswati, Lakshmi and Kali. Sevikas are meant to meditate on her weapons particularly. They see themselves as full fledged soldiers in an impending apocalyptic war; their daily personal mantra is translated as "Our limbs and bodies have been nurtured by our Motherland and we must give them back to her in her service alone". Expounding on this theme, Asha Sharma, who is in charge of the Delhi organisation, explained that this binds up the notion of sacrifice with that of active fighting. When I asked if it was some kind of a civil war situation that she had in mind, she replied that it was a possibility. Certainly then the explicit purpose for which the empowered Hindu female body is trained is patriotic war against the Muslim combatant. The large place that the myth of Muslim lust occupies within the general mythology of Hindu communalism would also explain the need for self strengthening.

Yet we must remember the oral version of the origin myth—Hindu goondas raping a girl in the presence of a Hindu husband—and also the reference to the larger status of the *swasangrakshanksham nari* within her own social milieu. Defence against and respect within her own environment is then the implicit subtext which might in every day calculations become a more powerful motive force and a more real compulsion than the ultimate political intention of Hindutva jagaran. When we consider the context from within which the samiti mobilises and trains its women, the force of the immediate compulsion becomes clearer. Sevikas come from upwardly mobile, urban, solvent, trading or middle ranking service sectors—a fertile breeding ground for dowry

murders and the violence on wives that precedes them. Women's organisations that deal with huge numbers of divorce or maintenance suits arising out of this social level, are very familiar with the violence and oppression that flourish here against women. In the big northern cities, if not in the rich small towns so far, education and professional, opportunities for women have come in late and recently but have come in a big way. Nor are families opposed to women's employment and professional training since it is regarded as a valuable source of extra income. Thrust into public and mixed spaces for the first time, women daily encounter yet new forms of overt or covert sexual discrimination and violence. It is no wonder that the physical training programmes of the *sakhas* prove extremely attractive to such women, with the promise of a powerful body and the attendant self-confidence. That body and that mental attitude that it generates would be a vital shield against gender oppression within domestic as well as public spaces.

We may then assume that despite the overarching aim of Hindu power, the woman needs also to utilise samiti facilities to empower herself against her own hostile environment. Problems of the newly mobile professional woman are often discussed in the *Jagriti*, the samiti journal. An article, for instance, describes how the author withstood the offensive behaviour of a police officer who partially undressed himself in her presence when she had gone in to report a street accident. Several others take up this theme: how to construct a responsible and fearless woman citizen and teach her to exercise her civic rights and duties within a chauvinistic world.

Two very different readings of the precise location of the Hindu woman within her own society seem to be jostling each other within the samiti. The *pramukh sanchalika's* speech at the 1990 annual conference insisted that "*Bharat* (read Hindu for it) *ki nari sarvada se mukt hai*" (The women of India have always been free). An article in *Jagriti* entitled '*Rashtra ka Adhar Nari*' reiterates this conviction and traces a long history of her power within Hindu society from Manu to the current movement. Yet the same issue carries another article—'*Nari Jagaran*'—where the present women's movement in India (which is not equated with the specifically Hindu movement) is described as a result of and an antidote to the generalised oppression against women. Whereas the earlier trend is extremely critical of the global women's movement as a sign of western corruption, the latter explains and legitimises it. Another article, '*Parivarit parivesh me Bharatiya Nari*' criticised Indian men for obstructing the larger entry of women into politics. It is interesting to see that while the more authoritative statements—Golwalker, RSS strictures, the samiti's official accounts—applauds the new Hindu women for resisting western modernism, women's own articles, when they deal with their everyday problems and

perceptions, are little concerned about westernised modernity. In fact the new Hindu woman citizen is cast in a mould which is very close to that of bourgeois feminism. *Nari ke sarvangin vikas ke liye uska arthik roop se swatantra hona paramavश्यक hai, atah nari ki arthik swatantrata ke liye rozgar me sangrakshan hona chahiye tatha usse sambandhit sabhi mukadamon ke liye mahila nyayadhis chahiye* (In order to attain the comprehensive development of women it is extremely important for them to be economically independent. So, in order to ensure economic independence, they need reservation in employment and they need women judges to conduct all cases related to such issues). The new Hindu woman is therefore, a person with professional and economic opportunities, secure property ownership, legal rights to ensure them and some amount of political power to enforce these rights.

How does this woman relate to Hindu tradition? I feel that Hindu tradition exists for her as a deeply cherished yet somewhat remote icon which requires ritual worship but is seldom brought out for daily use or inspection. There is very little interest in probing it and deciding on what it actually says about gender. In fact, very often the question of religious faith is interpreted as and completely displaced onto the realm of patriotic faith. The greatest triumph of the present communal moment has been to blend 'deshbhakti' and 'Rambhakti'—the two very potent sources of emotional involvement—into a homogenised whole so that adherents use them interchangeably. When our interviewer asked the karsevika Vijay Dube, a woman who plans to adopt sanyas, how Rambhakti has come to mean so much to her, she immediately traced back its source to her childhood experience of the China war and the passions it had aroused within her. Patriotic faith, in her case, was the original impulse that stoked religious passion and she herself was not aware of any distinction between the two. The process of mutual collapsing works with equal felicity the other way round too. At Ayodhya, it was the banning of the usual 'parikrama' route that is a part of normal pilgrimage activity, that turned pilgrims into karsevaks with great ease.

On specific questions of gender within Hinduism, the verdict seems to be unequivocally modernistic. Sati was squarely denounced by all office-bearers. When I asked about voluntary sati, a young activist said with genuine revulsion: *Woh ho nahin sakti. Aurat jalegi xyoon?* (It isn't possible. Why should a woman burn?). She then went on to explain that she might do it out of 'depression and frustration' that is, as a mark of weakness, not as a mark of strength—but neighbours and relatives must shore up her will to live. The samiti theoretically does not ban inter-caste or even inter-communal marriage, provided of course, the family agrees. The *Jagriti* coverage depicts two helpless

women against a black background, crouching in a helpless mourning posture. And out of that dark frame, a young, rather grim-faced woman steps out on the radiant half of the cover with a fire step and uplifted head. There are no traditional Hindu marks on her body—no 'sindur', no veil, no 'bindi'. She wears chappals, her sari is draped tightly around her and her whole stance is free, even aggressive. Of course, she does wear the samiti uniform—the purple-bordered white sari. A surprising feature of this magazine is its uncompromisingly non-'feminine' nature. It makes no concessions to conventional women's topics. There are no hints on beauty aids, no cookery or embroidery section, no advice on child rearing. Stories are scrupulously bare of the romantic element. They deal with the romance of Hindu civilisation or that of modern patriotism instead.

Women's power is a theme that is discussed and celebrated, often in the most grotesque of circumstances. At the Ayodhya karseva, a crowd of women was chanting the beautiful feminist slogan: *Hum bharat ki nari hain. Phool nahin chingari hai.* (We are the women of India. We are not flowers, we are embers.) When our interviewer asked them why Sita was absent in the invocations to Ram, the men fell silent but women had their answers ready. One said that this was Ram's birthplace and not Sita's which accounts for her absence. But Vijay Dube interrupted her to say that 'Shri' actually means Sita and hence in the chant Shri Ram, Sita is actually placed before Ram. The interviewer asked—"You mean Sita is contained in Ram?" "No", said Dube, "Sita comes before Ram". Not only had thought gone in to the location of Sita, there was also a recognition that Sita must come before Ram. In a VHP book for children, *Hanuman ki Kabaddi*, Hanuman declares himself to be neither Ram's 'bhakti', nor Sita's bhakti, but the bhakti of Sitaram alone.

I do not at all want to convey the impression that a sort of women's liberation is going on happily within a somewhat unfortunate Hindutva framework. When I asked Asha Sharma where the samiti differs from other women's organisations, her reply was immediate. "We do not believe that in marital disputes the husband is necessarily to blame. When we arbitrate, we do not take the woman's side, we are neutral. We tell the woman that she must do everything to preserve her home life. *Hum ghar torne-wali nahin hain* (We are not wreckers of home.) They offer no formal legal counselling to women, nor is divorce generally encouraged. Dowry is regarded as an evil, yet there obviously is no ban against its practice among sangh or samiti members. If a demand for full citizenship rights and affirmative action is made in *Jagriti* from time to time, there is no critical review of Hindu patriarchy. When karsevikas at Ayodhya were asked if their status would improve within Hindurashtra, one of them said yes,

because Muslims then would not be allowed to have four wives and that alone would ensure greater respect for women. She could not, on the spur of the moment, think of any other possibility within Hindutva for herself.

The same silence is maintained about caste. It is formally denounced and sakha members are not to submit their surnames when they enroll, so that their caste status does not become public knowledge. There is also community dining to ensure the absence of barriers. Yet the caste system is not a theme for discussion or criticism in boudhik study sessions. As with gender, class struggles are yet another field of resounding silence and non-involvement.

IV

Where do we feminists stand in relation to this manifestation of women's power? There is no denying that it does empower a specific and socially crucial group of middle class women, if not in an absolute feminist direction then definitely in a relative sense. It helps hitherto homebound women to reclaim public spaces, to acquire a public identity, it confers upon them a political role and even leadership. It teaches the women not to regard herself as merely feminine but as full-fledged citizens. It gives her access to serious intellectual cogitation.

We know the costs too. The public identity is regimented, colourless, grim. Intellectual discussion and political involvement have reached their fulfilment in a violent campaign of blind hatred, and not in a critique of class, caste and patriarchy. It prepares the woman to be a citizen of an authoritarian Hindurashtra, to wreck secular, democratic politics.

This paradox of self-limiting and violent self-empowerment must not be appropriated within current, fashionable, flat and facile critiques of post-enlightenment modernity which read Hindutva as yet another problematic manifestation of a necessarily distorted westernist discourse and seeks a resolution for it within a so-called unproblematic, accommodating, warm and generous Hindu tradition, in a shift from modernistic Hindutva to traditional Hinduism. Socialists and feminists can see no resolution for caste, class or gender issues within tradition, nor can they afford the luxury of ascribing all present distortions to an abstract, that notion of colonial discourse. In any case, the specifically modernistic elements in the communalism of Hindu women are hardly ones that they can identify as sources of distortion or recommend their abolition. The samiti's verdict on sati would be an obvious example. The real problems lie in the realm of active politics, the resolution lies with more aware and sensitive forms of Left democratic and feminist movements alone.

[This article was written before the Lok Sabha elections.]

Sukhamoy Chakravarty as a Development Economist

Manmohan Agarwal

On the occasion of the first anniversary of his death on August 22, 1990, this paper discusses Sukhamoy Chakravarty's views on development. As a development theorist, Chakravarty's work can be broadly divided into two categories. A characteristic of much of his earlier work is its concern with the implications of investment planning. Later, particularly after his experience in the Planning Commission, he was much more concerned with formulating an appropriate theoretical framework for analysing the development process and devising an appropriate development strategy, particularly for a labour surplus economy such as India.

SUKHAMOY CHAKRAVARTY acted as an economist in various capacities—as a development theorist, as a teacher, as an adviser to the government and as a guide of research policies and directions. We will here be mainly concerned with an analysis of his views on development. His value system provided both the motivation for his interest in development and guided his approach to the issues raised in development theory and policy. He was a socialist deeply concerned with the role and nature of economic motivation in an individual's activities. He wished that development would improve the living standards of more people. But his definition of a good standard of living was a relatively austere one, more akin to the ideas of Mahatma Gandhi and the early progenitors of socialism when the productive forces of society were much less developed. His stress on an austere living standard for people in the face of the explosion in the world's productive forces was based on his views regarding the desired nature of economic man, the incompatibility of combining western consumption patterns with alleviation of the poverty prevalent in most developing countries, and the ecological effect of replication of western consumption patterns.

Chakravarty's work can be broadly divided into two categories. A characteristic of much of his earlier work is its concern with the implications of planning. "The subject matter of the present study may be described as an investigation into the various logical issues which are involved in the problem of investment planning" [1959]. Later, particularly after his experience at the Planning Commission, he is much more concerned with formulating an appropriate theoretical framework for analysing the development process and devising an appropriate development strategy, particularly for a labour surplus economy such as India. In this work he deals much more fully with the rationale for planning and the relative role of planning and markets. An additional objective in this work is to resurrect a consensus regarding development since without such a consensus planning was difficult, if not impossible.

INVESTMENT PLANNING

Logic of Investment Planning [1959], which typifies work of the first category,

deals with the requirements of drawing up a satisfactory investment plan, albeit at a very abstract level. The major issue is the necessity to plan for a structural break. This in his view is a central and very difficult task for a plan. Later, in the context of his discussion of Indian planning, he stressed the structural changes brought about by such planning. Lack of appropriate market signals for determining investment priorities to bring about the required structural changes, while providing a rationale for planning, also renders planning difficult. Overcoming this lack of signals requires a creative act—one performed by the entrepreneur in Schumpeter and required of the state under planning. As in a different context he quoted the remark of Schumpeter, "adding on mail coaches does not result in railways" [1980a]. The discussion in the *Logic of Investment Planning* centres more on the necessity for planning for a structural break and how this could be accommodated in a plan framework than on the question of identifying the appropriate transition path or the nature of the structural break. He, however, notes that the choice of new industries involved in the structural break depends on the evolution of demand, the cost at which demand may be satisfied and the time involved in building up the capital stock. In the context of capital accumulation he analysed in detail how gestation lags could be appropriately introduced in the material balance equations and their effect on the dynamic evolution of the economic system.

Chakravarty's work in the 60s whose culmination was in the book *Capital and Development Planning* [1969], continues to examine the logical questions which need to be resolved in drawing up an investment plan. He studied the implications of drawing an optimal investment plan. This has an appeal not matched by a less ambitious framework such as a consistent plan [Chakravarty and Eckaus 1964]. The effect of factors such as the planning horizon, the choice of the terminal capital stock, the level of initial consumption on the optimal rate of savings and investment is studied. The nature of investment priorities is also discussed but at a high level of aggregation because of the difficulties of generating closed form solutions. Simple numerical exercises which are meant to be mainly illus-

trative of the Indian situation and not a full blown plan are used to bring out certain salient features of an appropriate investment strategy for India. For instance, choosing the terminal conditions appropriately from within the model on considerations of post-plan growth would lead to higher levels of consumption during the plan period than would choosing the exogenous terminal conditions arbitrarily [Lefebvre and Chakravarty 1965].

These optimal growth models employed the newly emerging techniques for economists in the field of the calculus of variations not only in its classical form but also the more recent advances. This work employed optimal control theory using the Pontryagin principle particularly useful where the objective function or the constraints were linear, and also the theory dealing with cases with constraints represented by differential equalities or inequalities involving state and control variables. But we are here interested more in examining the implications of this body of work for development policy than in the pioneering employment and development of new tools or techniques.

While keenly aware of the limitations of such abstract models for policy making, particularly under conditions of uncertainty, Chakravarty believed such analysis had several uses. "The answer is to be that such theories are of only limited interest. This, however, is not the same as saying they are useless" [1969]. It serves to show how the objective function can be chosen to reflect structural features of developing economies. For instance, if for various reasons, the consumption of those employed is different from that of those unemployed, then the implications of this for the achievable level of savings in the society can be taken account of by postulating the consumption of the employed as a separate argument in the utility function to be maximised.

The analysis also serves to clarify how certain choices cannot be made on *a priori* grounds in divorce of practical considerations. The principle can be illustrated by the discussion on the choice of an appropriate rate of time discount. In this controversial area one group has argued that an intertemporal discount factor should be incorporated in problems of social optimisation just as in private intertemporal decisions.

Another group has argued that there is no reason why society should reflect the same myopia as individuals. Chakravarty argued that the more important concept was one of inter-generational equity. If not introducing a time discount factor resulted in very high current savings rates, then in a sense the present generation was being discriminated against in that it had a high savings rate despite a lower income. Thus inter-generational equity might require the use of a time discount factor. Similarly with the question of the appropriate time horizon for planning. Logically any method of closure of a finite horizon model is unsatisfactory and planning over an infinite horizon is more appropriate. Uncertainty does not entail a finite horizon because the time horizon itself becomes an unknown. But arbitrary assumptions may have to be made to ensure convergence and an appropriate ordering among programmes over an infinite horizon. Thus no particular specification may be unambiguously preferable and both may be used to provide insights. The analysis also has the virtue of rendering explicit certain choice elements, and it might enable one to distinguish choice elements which significantly affect the optimal path from those that do not.

At the practical level, optimal growth models provide a blueprint for discussion with political decision-makers. "The usefulness of growth models lies not in suggesting blueprints for immediate adoption but in providing certain scenarios for purposes of carrying out dialogues between the planners and the policy-makers" [1988]. Earlier in 1980 he had written, "Optimal growth paths serve not as blueprints but as possible benchmarks for dialogue." They can also be helpful in classifying an optimal class of paths. For instance, one of the most significant results of his work on optimal growth models was the conclusion that a Mahalanobis type strategy of concentrating on the machine goods industry did indeed characterise an optimal path if it was assumed that capital was not shiftable between industries and that the economy started from a position of relative capital scarcity.

DEVELOPMENT POLICY

In his later work, Chakravarty attempted to create a consensus regarding development policy—a consensus without which a society cannot plan its development path. He had argued in *Capital Formation and Economic Development*, when talking about the theory of rational choice over time, "However, behind any statement of this sort, there must be some implicit hypothesis regarding the existence of a stable political structure, which must reflect a minimum degree of consensus on the goals of economic policy. The normative usefulness of a maximising entity loses its value if a society reaches a deadlock between sharply opposed social groups", or, as he put it more succinctly later in 1989, "Planning after all requires a broad measure

of public consensus". Such a consensus about development economics had prevailed among economists in the 50s and 60s. But it had been fractured in the 70s and 80s with some economists even claiming that there was no scope for a separate discipline of development economics. In India, the political consensus on development policy achieved under Nehru had also broken down.

Chakravarty's attempt to forge a new consensus on development economics—the need was stressed in his Marshall Lectures, [1989a,b]—as well as to develop a coherent development strategy for a labour surplus economy such as India in the face of the economic, social and political changes which had occurred since the advent of planning, were further complicated by the happenings in eastern Europe. He was grappling with the question of what these events revealed about people's preferences, about the nature of a desired society in general and for development policy. Elements of the consensus would have to reflect the goals of development policy, the role of markets and planning and at a more practical level development strategy and investment priorities.

In examining the relevance of a discipline of development economics in current circumstances Chakravarty studied the development of the subject by discussing in a series of articles [1980, 1988, 1989a, 1989b] the contributions to development of economists such as Marshall, Marx, Schumpeter, the important conceptual contribution of the Bukharin-Preobrazhensky debate, etc. The acceptance by policy-makers in both the developed and developing countries of a theory of a state-directed policy of industrialisation developed initially by economists such as Manólesco, Mandelbaum, Rosenstein-Rodan, etc, at the time of the second world war, was not so much because of alleged market failures but from a growth perspective furnished by data in regard to southern and eastern Europe on massive agrarian overpopulation [1989a].

VALUE SYSTEM

As far as Chakravarty's value system was concerned he remained deeply committed to a particular vision of development. The question is not only one of the distribution of the fruits of development but also of the role of economics in the life of an individual and the nature of economic motivation. He preferred economic relations based on a co-operative value orientation rather than on competitive organisation of private consumer goods. He was thus extremely concerned with developments in eastern Europe and China which placed greater emphasis on provision of private consumption goods as it suggested that capitalist and socialist modernisers have the same perception of what constitutes a good life with the question being reduced to which system generated faster productivity growth [1987a]. His objectives did not necessarily require a

very rapid rate of growth. As he put it in his article on 'Nehru and Indian Planning' [1989f], "It is not so much the modest rate of growth that bothers me, but several other major areas of underachievement. These include low levels of literacy, an increasingly inefficient secondary school system, insufficient provision of health care and growth of unemployment in urban and rural areas." The distributional and welfare goals could be achieved with a modest rate of growth only if consumerism, particularly of the rich, could be restrained. He was, therefore, disturbed by the idea that consumerism could be the sole motivation for economic activity. At the global level he believed that such consumerism should be restrained for ecological reasons.

Wide distribution of the fruits of growth required an employment-oriented plan. But one had to take a long-term point of view because a seemingly pro-employment policy may turn out to be against the interest of the working class in the long run [1974]. From the long run point of view the factors permitting rapid growth are also typically the factors which facilitate the stepping up of the rate of capital formation, though the converse need not be true. If unemployment is large and if the rate of growth of the system is greater than that of the stock of labour, the time needed to attain full employment is likely to be minimised if the system is permitted to grow along a Von Neumann-Lewis path. In a country with a large surplus labour force the maximal rate of growth of output and employment would be reached by utilising this surplus labour for capital formation. But for such collective non-market creation of assets the question of the distribution of benefits from such assets has to be resolved. Failure to resolve this question has been one of the reasons for the usually limited reach of 'food for work' programmes. Land reform can spread the benefits of growth. If not land reforms than other forms of institutional reforms, including creation and holding of rural assets by collectivities in rural areas together with provision of services to small holders, will be needed. But the problems of land reform, or providing services to small holders or organising unemployed rural labour cannot be tackled without strong determination [Lefebvre and Chakravarty 1965]. Altering the pattern of growth needs to be supplemented by programmes directly targeted towards the vulnerable groups.

What of the role of planning? Chakravarty had long held the view that planning and the use of markets were complementary rather than rival approaches. The case for planning based on the notion of market failure is analysed in great detail [1973]. Market failure could arise from non-existence of a competitive equilibrium—here he emphasised increasing returns to scale, absence of markets—particularly of futures markets, inoptimality of the equilibrium because of the presence of distortions or because of the asymmetric income distribu-

tion. He saw planning as a form of 'instrumental inference' rather than as an alternative to a market system based on command and fulfilment. It can serve a strategic purpose because the process of development generated large discontinuities and the market mechanism would not provide adequate signals for investment for such structural changes [1977, 1989b]. Market failures can sometimes be corrected by internalisation brought about either by pricing out the external effect, or by mergers, namely, changing property rights. In the absence of such change in property rights, the burden on the fiscal system may become too large—he stressed Schumpeter's concept of fiscal sociology—or extent of dependence on quantity-based allocations will need to be stepped up. Furthermore, a market-based growth strategy might tend to ignore the poor. Complete reliance on market signals would give greater importance to the consumption of the upper classes who after all have more purchasing power. Dangers of consumerism have been discussed above.

Furthermore, in the Indian context adoption of such an energy-intensive consumption pattern would run into a balance of payments constraint. Consequently, the market mechanism can be used to play a coordinating role and has the advantage of better utilisation of dispersed information and can be used for allocational efficiency. But it should not be used as a process valued in itself where all allocations are justified on the basis of consumer sovereignty. But the dilemma was whether one could dissociate the market as an instrument from the market as a value system, namely, may not one end up by accepting any outcome which was market determined as optimal. As he put it [1989f] "to treat the market as an instrument of plan fulfilment is a different thing from treating the market system as the sole provider of all relevant economic signals". But part of the problem with planning has been that planners sometimes took the view that relative prices were fixed, thereby choosing to rely more on planning by discretion rather than through the market even when it was possible and probably even desirable to do so. The task of planning today in India was to make adequate provision for the future unborn generations, to take better care of the poorer sections and help facilitate much greater induction of socially relevant technology, none of which would be done particularly well by the market system.

For successful planning the quality of planning must be improved. This implies that the plan should identify the constraints to development and order them in a causally significant way. Based on this an appropriate strategy of development has to be devised and this has to specify the major structural relations and suggest the appropriate mixture of incentives and disincentives for the economic agents. While we do not possess a theoretically coherent and empirically well grounded causally adequate model of growth, development theory would

be useful in identifying the critical variables [1980]—whether material capital is to play the critical role in determining the desired path of development or motivation of labour or technological improvement, etc. But too often what has been stressed has been merely the arithmetic of planning to ensure superficial consistency rather than a proper theory of planning according to the above-mentioned framework.

DEVELOPMENT PROCESS

A theoretical framework for analysing the development process could benefit from a number of insights offered by the classical paradigm. The wage rate at which labour can be transferred from agriculture to manufacturing is fixed because of surplus labour and is institutionally determined rather than market determined. Furthermore, in the classical paradigm the economic problem par excellence was that of production and viability of the system in whether a surplus existed [1989c,d]. If the economic system was sufficiently productive then the rate of profit and the maximal rate of growth were given by the production structure. A particular contribution of Marx was to draw a distinction between a worker's productivity and his wage. The process of development under capitalism implied utilising the labour power. This concept was utilised by economists when discussing the use of under-employed labour for development. Furthermore, though the classical system was affected by necessary consumption, it was not affected by luxury consumption—another property that appealed to him. Chakravarty sought to express the ideas of classical economics in the idiom of neoclassical economics using mainly the language of input-output analysis both in his review of Sraffa [1961] and in his unpublished manuscript on Marx's economics.

Because of changes in the underlying socio-economic reality in India his perception of the constraints to the growth process in India changed. However, coherence was provided by his value system and his ideas regarding the main springs of the growth process [1984, 1987c]. He, thus, continued to stress the importance of investment allocations and a strong role for the government. The main changes in his views related to the linkage between agriculture and the rest of the economy and consequently to the appropriate policy for agricultural development, policies for poverty removal, the role of technological change and entrepreneurship and, perhaps more importantly, the role of the state in economic development which obviously incorporated the question of the nature of the state.

From the beginning Chakravarty stressed the importance of investment allocation even though some of his work dealt with questions of the overall rate of investment or the choice of techniques—the other important decisions which a developing economy has to undertake. Though these decisions are

interrelated there were still differences as the question of an appropriate level of savings and investment was relatively more of a political decision than the question of investment allocations which was somewhat technocratic and depended on the constraints facing the economy. This was not to deny that the actual allocation chosen would have distributional and welfare consequences. The government was to ensure the appropriate level of savings and investment through management of the budget and the public enterprises. Macro-level decisions were the prime causal factors in his perception. As noted above, his view of employment generation stressed more the macro growth strategy than the micro level choice of technique decisions which could be left to district planners or production units.

Throughout much of his work he stressed investment allocation issues, but as his perception of the constraints facing the Indian economy changed there was a shift in his views of what the priorities in actual allocation should be. One of the major conclusions of his work in the area of optimal growth, as already noted above, was that for a capital poor country the insight of Mahalanobis remains true that the investment allocation should be biased in favour of the capital goods producing sector. But the experience of the Indian economy in the 60s and simulations of large programming models showed the importance of larger food output in raising the rate of growth. Emphasis thus shifted from the notion of capital as machinery to capital as wage goods. But he argued that a judicious mixture of the two forms of capital could lead to faster rate of growth than an unbalanced mix [1988].

ROLE OF AGRICULTURE

This insight was later developed more fully to tackle the role of agriculture in economic development. An underdeveloped agricultural sector could not sustain rapid industrial and economic growth. An agrarian transformation was necessary to provide for the growing wage bill in the non-agricultural sector and to broaden the domestic market. Growth in the agricultural surplus could have a multiplier effect on industrial output and enable it to reap the economies of scale prevalent there [1989b]. A growth strategy based on getting a supply response from richer farmers might lead to larger agricultural output but its spread effects might be limited, particularly if the increase was based on use of import-intensive oil-related inputs, the consumption pattern of the richer farmers was import- and energy-intensive and government support programmes maintained agricultural prices above those that would prevail under competitive equilibrium preventing broadening of the market for consumer goods which would otherwise ensue from the increased real incomes of wage labourers [1979]. Emphasis in theorising about how to bring

ENRICHING SOCIETY THROUGH INDUSTRIAL PROMOTION

THE ENTREPRENEUR'S RIGHT ARM—APIDC

APIDC is established by Government of A.P. for planned development of Large & Medium Scale Industries in the State. Enriching Society through Industrial Promotion is the cherished mission of the Organisation

Today, APIDC's accent is on:

- ★ High Technology Projects as a thrust area for project promotion
- ★ Bio-technology has unlimited potential in agriculture, food processing, health care, chemicals and pollution control
- ★ If you foresee bright future for Biotechnology, come to APIDC. We will work together from concept to completion
- ★ APIDC Venture Capital Company Limited is a 100% Subsidiary of APIDC. Assistance under Venture Capital Scheme is available for projects relating to development of technology, introduction of new projects which fall in the high risk and high returns zone
- ★ APIDC offers special schemes to extend financial assistance on concessional terms to Women Entrepreneurs with a ceiling rate of interest of 12.5% in backward areas and 15% in other areas
- ★ APIDC guides the entrepreneur through Entrepreneurial Development Guidance Centre in the following areas.
 - a) Training b) Guidance c) Marketing the Message
 - d) Research & Evaluation

SERVICE ALL THE WAY

APIDC also operates other schemes which include:

- ★ Loan facility for Hospitals and Nursing Homes
- ★ Assistance for Equipment Modernisation
- ★ Assistance for Equipment Refinance, etc.,

This is what puts APIDC in a special class by itself

about an agrarian transformation has shifted to technological modernisation from its earlier reliance on spreading knowledge of appropriate agricultural practices and transforming the rural social structure. But spread of the green revolution to eastern India would require institutional reform as well as research and development in water management, required inputs including energy, and crop husbandry—all of which would require a strong government role [1972, 1988].

Such a strategy of peasant development was necessary to carry out the transformation of an old agrarian society in the face of new competitive commercial forces that were more productive. A small holder strategy would ensure the goods produced—wage goods—were those which ranked high in the preferences of such households, and would draw out the potential surplus available on small holdings—a concept which was stressed in the earlier writings on development and—determine the savings consumption margin in these units.

FOCUS ON CAPITAL GOODS

While recognising that induction of more productive technology from outside the community's common pool of knowledge could affect the micro units of production, his earlier emphasis on investing in capital goods industries remained. Much of technical progress is embodied. A high rate of investment in the capital goods industry would enable the economy to benefit from the economies of scale prevalent there. Reduced public investment since the mid-60s which prevented exploitation of the economies of scale and lack of technological upgradation were responsible for many of the problems facing the Indian economy. Import of technology to improve productivity of the capital goods sector was important as these sectors needed to grow rapidly almost irrespective of the other changes in the development strategy. For instance, simulations while drawing up the Fifth Plan showed that rapid agricultural growth also required fast growth of these sectors as one of the consequences of the green revolution had been to make Indian agriculture more dependent on such industrial inputs.

Learning by doing was not neglected in his theory of development. He stressed the importance of investment in human capital through expenditures on education, health, etc., as only such investments would enable appropriate learning by doing to occur as well as directly raise labour productivity. But learning by doing only occurs with doing and doing requires production and so capital goods. But perhaps most importantly, development of a domestic capital goods industry was absolutely essential to enable productivity to be raised in a large number of industries. Technical progress in the capital goods producing industries had far-reaching spread effects raising productivity in all the industries using such capital goods and was

thus capital saving for the economy as a whole. However, in his later work in line with the experience of countries he emphasised knowledge. As he said in his Marshall Lectures, "Understanding of the basic development problem, which earlier centred around the process of capital accumulation, has shifted to problems which are more closely connected with issues of technology and knowledge, which can be studied in complete disjunction from those embodied in capital goods." As he noted, one of the advantages of the market was its ability to use knowledge which was widely dispersed.

He had thus changed his views regarding the appropriate pattern of investment for a labour surplus economy from one stressing perhaps excessively concentration on the capital goods industries to one which stressed those investments which would bring about the agrarian transformation and increase production of goods consumed by the poor. But he rejected a more consumption oriented development path because such a development path would not be able to take advantage of the external economies arising from the development of a capital goods industry or to remove poverty.

In such a system trade had perforce to play a limited role. Of course, advantage should be taken of the opportunities provided by trade and import substitution should not be carried too far. However, development of the capital goods industry was necessary and not something supported by the conventional neo-classical theory of comparative advantage. Also trade had little role to play in bringing about the agrarian transformation. The agrarian transformation was also necessary to capture more of the gains from international trade *a la* Lewis. Expansion of exports would be difficult in the current situation of expected slow growth in world trade as compared to the 60s and 70s, increasing protectionism and the increasing competitiveness of the world market as more and more debt ridden countries try to increase exports [1983, 1987, 1989e]. Further more, the problems of infrastructure and inflation caused in part by the prevailing tax sociology, may make it difficult to expand production of exportables. It is an open question whether India can emulate the Korean experience of containing the rise in real wages and inducting relevant technology [1987b]. In fact, given the likely pressures on the balance of payments, import substitution in areas such as energy and vegetable oils is urgently required.

The instrumentality of the state was necessary to maintain a high rate of investment in socially relevant sectors. This required a state acting in some sense for a natural interest over and above the sectional interests supporting a particular government. His notion of the state was Hegelian in the sense that it represented a national interest. He was profoundly disturbed by the happenings in eastern Europe as it seemed to suggest the impossibility of rational choices on the part of collective units. He

had not come to terms with what the alternative could be, and was groping for clues. In his own words he preferred to apply the method of 'morphogenesis' as the geologists apply paleontology to understand the evolution of micro units of production, be it in agriculture or in manufacturing.

COMPREHENSIVE WORLD VIEW

Chakravarty had a comprehensive world view from which he analysed development issues. This world view was the result of reading and scholarship. His stress on scholarship is one of the facets of his personality his students remember fondly. However, in those student days it could be troublesome. When one met him he would enquire what one was reading. If one mentioned what one was reading a series of questions on that material would follow—questions which students very often found disquieting. But if the student were to answer nothing, then would follow another series of questions designed to make sure that the student was well. But what seems in hindsight amazing is that students recognised even at that time that the questions about their reading were in the spirit of all being in the search for knowledge and this search being not only a co-operative venture where class distinctions did not exist but also a joyous venture. His enthusiasm could infect others than students. Samuelson on reading the typescript copy of *Capital Formation and Economic Development* was moved not only to write a foreword to the book but came and read the entire foreword to his class.

Chakravarty was not only a theorist. He stepped out into the difficult terrain of policy advice from his area of intellectual endeavour where the objective is truth into the political arena where the objective is power. In this difficult arena he did not surrender to the holders of power but provided them with his expert advice not bending it to suit the requirements of power. His uncompromising intellectual integrity is shown by the respect that he commanded even from those who disagreed with him. However, at heart he was always an academic and I, for one, will always think of him striding briskly to the library carrying a handful of books.

DISCUSSION

Industrial Retardation

Snigdha Chakrabarti
Ashok Rudra

If we have to adequately reply to all the points raised by Partha Roy (May 11, 1991) on our article 'Where is the Industrial Retardation?' (September 29, 1990) we shall have to repeat several passages from our own articles. One of the points made, not once but several times, by Roy is that "CR neglect the whole of the 1950s and arrive at trends that the earlier authors could not find" and that, therefore our conclusions are "unacceptable because the time frame was entirely different".

It seems Roy has not understood even such very clear statements as the following which occur in our article: "We do not, however, interpret our results as suggesting that these economists were all wrong in their interpretation of data. Our very different results refer to a very different time comparison" and "for those time comparisons the authors were entirely right about their judgment".

Another criticism by Roy is that "the lack of any aggregative measure seriously delimits the generality of CR's statistical results". As if Gross Fixed Capital Formation in the economy as a whole and in the public sector and the private sector separately are not aggregative measures. Everybody would agree that "slow-down of gross fixed capital formation is not the only factor responsible for industrial deceleration since the mid sixties". But that slow down, especially in the public sector, was suggested by many as one of the most important factors causing the 'industrial retardation'. As such, our result that in the 24 year period between 1961 and 1985 public sector investment, instead of slowing down, actually grew at an increasing rate does not lose its importance.

Partha Roy asserts that "if one sees the data on industrial production carefully (index or otherwise) one gets two distinct breaks, viz, Period I 1950-51 to 1964-65, Period II 1965-66 to 1979-80, Period III 1980-81 to present date. The first period is characterised by relative growth, the second period by stagnation followed by the third period of further growth". We are highly impressed by his self-confidence about "careful" reading of data but not at all by the method he suggests. We are further perplexed by the fact that after suggesting a three-period analysis as being appropriate he presents some numerical results which involve only a two-period break up. Whether two period or three period, we are strongly opposed to any method that involves starting off with

assumed breaking points. "the hypothesis of a structural break in industrial income is confirmed" is not a conclusion that follows from that exercise. Instead of 1964-65 let him take any other year, say 1965-66 or 1963-64, it is almost certain he would get the same kind of results. So which year should we choose for the break?

The crux of the difference between Partha Roy and ourselves lies precisely here. We believe that whether there is a tendency for deceleration or not has to be extracted from the entire time series data. Partha Roy believes in cutting up the time series at some subjectively chosen points and showing that the rates are constant within each period but different in the different parts. According to us the method is crude. If the extreme one can produce different results by choosing the dividing points differently.

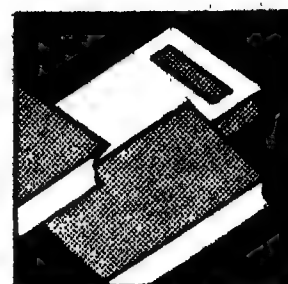

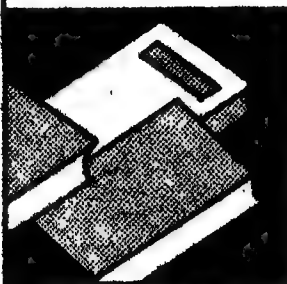

Partha Roy mentions the names of some authors who have noticed the picking up of industrial growth in the 1980s. That is not surprising. We did not claim to have unearthed an secret treasure. The point is that a number of very important economists debated about the trend being one of deceleration. There has been no recognition before us that one was mistaking the downswing of a cycle for a change in the trend. The economists who debated about the causes of deceleration did not evince any comparable interest about the possible causes for the reversal. In economics the difference between trend and cycles is of significance stretching far beyond the reaches of elementary descriptive statistics of curve fitting.

We have refrained from using index number of industrial production very deliberately. The reasons for our deep distrust of such constructs are discussed in detail in a monograph by one of us, Ashok Rudra, (*Measurement in Economics*, Allied Publishers, 1967). The individual industries we have chosen may represent only a small part of the total weight of the industrial sector but they are leading or core industries. If during a certain defined period these core industries did not show any deceleration that is hardly a matter that can be denied importance.

Finally, we learn with dismay that according to Partha Roy a particular author has already "doctrinised" the "turnaround of industrial production". We consider ourselves lucky that we have not been accused of "doctrinising" anything. Doctrines, in our judgment, have no place in science.

MAKE AN INTELLIGENT MOVE

EXEMPT YOUR CAPITAL GAINS FROM TAX INVEST IN **IDBI** CAPITAL BONDS

Long term capital gains from the sale of land, buildings, jewellery, shares etc. attract Income Tax. But there is a way out. Invest in IDBI CAPITAL BONDS, keep your capital intact and earn interest too.

- Bonds available at par throughout the year
- Exemption from tax on Capital Gains under Section 54E of the Income Tax Act, 1961
- Income tax benefit under Section 80L
- Exemption upto Rs 5 lakhs from Wealth Tax under Section 5(1) (xvii) read with Section 5(1A) of the Wealth Tax Act, 1957
- Interest at 9% p.a payable half yearly
- At the investor's option, interest for the full period of 3 years can be paid in advance on discounted basis
- No deduction of tax at source.
- Outstation cheques accepted and cost of collection borne by IDBI

ALSO CONTRIBUTE TO THE INDUSTRIAL DEVELOPMENT OF THE COUNTRY
